L liberalism

The circumstances of the decade which ended with the establishment of the United Nations organization were decidedly adverse to the survival of liberalism in the 19th century sense. Practically all states which took part in World War I had followed the trend toward centralization in domestic, and force in foreign affairs. Freedom of enterprise, in the world economic depression, was decreasingly accepted as a norm of policy, and free trade lost many of its former exponents in theory as well as practice. Disarmament dropped out of sight even as an ideal, and international peace ceased to be thought of in terms of what was fashionably called appeasement. Yet the term liberalism retained its popular appeal. It was invoked by very varied schools of opinion to denote a position somewhere in between the status quo of the pre-Roosevelt era and the kind of collectivism that could be called, by its opponents, totalitarian. To some extent the word democracy fulfilled this function; but since, during World War II this term was claimed by the Russian, the Spanish and even the Chinese governments, the word liberalism became the residuary legatee. Its prestige was directly related to its ambiguity; and this fact called forth a flood of controversial writing in which the proper meaning of the term was debated.

What is Liberalism?—In academic circles the discussion gained momentum from the current efforts, rapidly increasing during and after the war years, to redefine the function and curriculum of the liberal arts college. In general these efforts were directed to a more coherent integration; and the quest encouraged a re-examination of liberalism's first principles in terms of their historic origins. A good example was J. S. Bixler's *Conversations with an Unrepentant Liberal* (Yale University Press, 1946), in which two contemporaries of Plato continue to philoso-

Eventful Years

phize, largely in Platonic terms, in and upon the modern U.S. scene. The essence of liberalism is represented (Plato to the contrary notwithstanding) as freedom of utterance, tolerance of conflicting opinions and devotion to rational analysis as the sole ground of truth and universality. This applies to religion as well as to ethics and politics. "Religion is active, devoted, and loyal commitment to the best that we can discover, and the best can be discovered only by using our reason for all that it is worth." The kind of reason intended is "that which we know as a principle of coherence, a set of logical relationships which judges life and provides rules for it." This faculty is a better ground of universality than the special insights claimed by any religion, including "the particularistic features of Christianity." The author's position is thus radically anti-authoritarian; and liberalism in education becomes an apotheosis of the method of free enquiry.

In this interpretation Bixler was supported by Morris R. Cohen, who wrote in *The Faith of a Liberal*, "The open eye for possible alternatives, each to receive the same logical treatment before we can determine which is the best grounded, is the essence of liberalism in art, morals, and politics." (*The Faith of a Liberal* by Morris R. Cohen, copyright, 1946, by Henry Holt and Company, Inc.) Critics of this identification of liberalism with pure rationality could, however, protest with some reason that it is too academic, or aristocratic, a principle to be of much effect as a guide to political action. The attitude of suspended judgment may suffice on the bench or the rostrum, but the business of life consists largely in coming to conclusions. It was this fact that gave the empiricism of John Dewey so wide a vogue in the United States. Bixler scored a point when he argued against Dewey in his book cited above that the determination of what is really useful

demands a priori criteria. The point was, however, an academic one; for the pragmatic liberalism of Dewey attained its popularity because it expressed in quasi-philosophic terms the propensity of a pioneer people to act first and reflect afterwards.

Christian Liberalism.—Those to whom both the rationalistic and the pragmatic solutions seemed inadequate were inclined to pursue the analysis on historical lines from the Greek to the Christian synthesis. Thus, W. A. Orton, in *The Liberal Tradition* (Yale University Press, 1945) emphasized the Aristotelian rather than the Platonic elements in western thought, and attempted to show, by both historical and analytical exegesis, that the ultimate foundations of the philosophy of freedom are transcendental. "The fundamental values of the liberal tradition were in fact exemplified, formulated, and wrought into the texture of Western society by Christianity, not only as a school of thought, but as a way of life and feeling: as religion, in short." This position was corroborated by the Catholic historian Christopher Dawson, in *The Judgment of the Nations* (Sheed and Ward, Inc., 1942): "Religion was the source of the moral standards and spiritual values which are essential to the liberal tradition, though liberals frequently ignored this and attempted to base them on abstract ideas. But the rational ideas of liberalism were abstracted from a historical religious tradition, and the liberal culture was strongest and most enduring precisely in those societies in which the Christian social and political consciousness was most alive."

These and other Catholic writers represented, on the whole, the liberalism of Lord John Acton, whose dictum that liberty is the highest political objective carefully implied that there are other and more positive ends, of which political liberty is an essential pre-condition. Their historical perspective, however, was to some extent shared by leading Protestant liberals, prominent among whom was Reinhold Niebuhr. Niebuhr, like Bixler, rejected the authoritarian elements of Catholic tradition; the individualism of his religious philosophy was in curious contrast to the societal bent of his political ethics; but he was emphatic in rejecting purely secular criteria of "progress." Indeed, the notion of secular progress embodied in Ramsay Muir's definition of liberalism ("A belief in the value of human personality, and a conviction that the source of all progress lies in the free exercise of individual energy; it produces an eagerness to emancipate all individuals or groups so that they may freely exercise their powers, so far as this can be done without injury to others; and it therefore involves a readiness to use the power of the State for the purposes of creating the conditions within which individual energies can thrive, of preventing all abuses of power, of affording to every citizen the means of acquiring mastery of his own capacities, and of establishing a real equality of opportunity for all.") was relegated, for what it was worth, almost exclusively to the Marxists.

The historical analysis of liberalism by Christian scholars necessarily involved the evaluation of individualism as an element in the liberal tradition. Here the differences between Catholic, Anglican and Protestant writers, especially in their treatment of Martin Luther and John Calvin, followed the lines one would expect; but even in the extreme Protestant sects of the United States the emphasis on the individual was yielding priority to the concept of community, and the application of positive moral criteria to the actions of organized society made conspicuous advances—at least in theory. This was the more noteworthy

in that the leading exponents of *laissez-faire* in the 19th century United States rested their case to a much greater degree than generally remembered on Protestant ethics. From Francis Wayland to J. B. Clark the basis of individualist economics was far more religious than in contemporary England; and the work and writings of Herbert Hoover reflected much that was finest in this school of thought. The career of R. B. Ely (1854–1943) was an instructive record of the transition from an individualist to a social standpoint in economics within the framework of a positive Christianity. In this connection it is relevant to recall the strong support given to the policies of Lloyd George in the years 1906–11 by what was then called "the non-conformist conscience." There can be no doubt that a parallel development occurred in the United States a generation later. The activity of the Federal Council of Churches in social and international matters, despite the doctrinal divergencies between its 40-odd constituent organizations, amounted on the whole to a significant demonstration of Christian liberalism. In England and western Europe the application of Christian principles to both domestic and international problems evoked a degree of religious co-operation that might prove to be of great significance to the future of liberalism; but in the United States the vigorous attack waged on the Roman Catholic Church by both Protestant and secular groups of the political left discouraged any such expectations.

Liberalism and Rome.—A further difficulty arose from the little-understood fact that, as Father J. J. Scanlon, S.J., reminded the U.S. press in 1946, the church uses the term liberalism "in a special technical sense." Particularly in the United States this sense is almost exclusively the continental one which Pius IX and his immediate successors so emphatically denounced. In this connotation the term liberalism harks back to the French encyclopaedists and Freemasons (Grand Orient) and becomes synonymous with individualism, rationalism (so-called), agnosticism and materialism. In this, as in so many other respects, U.S. usage follows French rather than English precedent. An important study by E. J. Hughes, *The Church and the Liberal Society* (1944) was a case in point. The author's attack on liberalism takes its weapons equally from the popes and Professor Harold Laski; there is no reference to Acton, John Bright, Richard Cobden, L. T. Hobhouse, A. Marshall or other great exponents of English liberalism, and William Gladstone is mentioned only for his dislike of the Syllabus of Errors. So understood, or misunderstood, liberalism is saddled with the blame for the chronic economic crisis and a couple of world wars; but what the author boldly terms "the collapse of the Liberal Society" is simply the breakdown, in both theory and practice, of modern utilitarian *laissez-faire*. To represent this as the whole content of liberalism is plausible only because of the desuetude of the classical culture from which liberalism drew its philosophy of freedom.

There is, of course, abundant evidence, especially in Marxist writers, to support the narrow view; but it is far from constituting the whole case, and there would seem to be both room and need, in the postwar period more than ever, for an accredited term to denote the position which rejects both toryism and state-centred collectivism. Such a position may reasonably be held to rest on Christian foundations; and the courageous and dynamic teaching of Pope Pius XII, particularly in his exposition of the role and responsibilities of private property and economic power in the modern social order, was such as to command the attention of liberals of every persuasion. The rise in Europe of avowedly Christian parties which rejected both

individualism and Marxism was among the most significant political phenomena of the postwar period; and it is permissible to ask why, if the term Christian socialism had won a certain measure of acceptance, the term Christian liberalism should not make a bid for general currency.

Neo-liberalism.—Whether that expression could apply to modern U.S. liberalism was, however, doubtful, since so large a proportion of its exponents were either non-Christian or anti-Christian. Again, the situation was in sharp contrast to that of English liberalism, some of whose stoutest defenders now rested their case on Christian grounds: an interesting reversal of roles. Francis Neilson, formerly editor of *The Freeman*, argued vigorously in the 1940s for a revival of both the name and the substance of political radicalism: a tradition of which he was a gallant, if somewhat lonely, exemplar. The term radical, however, had lost its popular appeal, probably because of its strongly individualist associations. U.S. liberalism, or neo-liberalism, as it was coming to be called, was radical in the sense of being anti-traditional, but it was also becoming more and more collectivist.

Few works had more influence in this direction than H. J. Laski's *The Rise of Liberalism* (Harper & Brothers, 1936). In this able and well-documented study, liberalism is represented as rooted in the 17th century conception of private property, and as owing both its political and its economic success to the desire of the owning minority to make the most of it. Many liberties of permanent social value resulted; but there was a fatal flaw. "The individual liberalism has sought to protect is always, so to say, free to purchase his freedom in the society it made; but the number of those with the means of purchase at their disposal has always been a minority of mankind." To present this half-truth as the whole story is possible only through the gentle art of omitting evidence. The depiction of liberalism as, in the end, nothing more than the self-interest of the bourgeoisie rests frankly on the materialist interpretation of history and the class theory of society. It was therefore generally accepted by those who were willing to follow Professor Laski at least part of the way to Moscow. Thus Max Lerner, perhaps the outstanding spokesman of U.S. neo-liberalism, wrote in 1938 (*It Is Later Than You Think*, The Viking Press, Inc., 1938, 1943): "There is a new type of liberal emerging—the democratic collectivist. His leanings are leftward, toward a broadened base of government and culture. His aim is to reassert for the contemporary world the aims of the liberal movement of the seventeenth and eighteenth centuries, but to do it on the base of the newly emerging class of today that corresponds to the emerging capitalist class of that day. His economic program is one of democratic socialization." From this standpoint the traditional economic liberalism of Justices Oliver Wendell Holmes and Louis Brandeis, like that of Herbert Hoover and Robert LaFollette, Sr., was definitely out of date, and those who defended it were regarded as reactionaries.

Nonetheless, it had its defenders, in a very important sphere of U.S. policy. The attack on combines and cartels so vigorously waged by the department of justice in the 1940s embodied a faith in free competition and a dislike of concentrated economic power that was applauded equally by midwestern progressives and urban opponents of capitalism in general. The spirit of 1890 was obviously very much alive; but it was somewhat hard to reconcile with the increasing reliance on state control, state subsidies, state benefits and state enterprise that neo-liberalism took over from the New Deal. The dilemma was aptly illustrated by Thurman Arnold, former attorney general of

the United States, in a statement published in *The New Republic* of July 22, 1946. Arnold denounced "those so-called liberals whose principal social value is security for the underdog, rather than opportunity for the individual. For example, one of the most popular liberal causes is strong labor organizations. Many liberals would fight for every strong labor organization until it became a force which restricted production, throttled new enterprise, prevented individual collective bargaining by local units and destroyed democracy in labor. At that point, they would seek to curb it by strong government action. The pro-underdog liberals rely on super-organizations of labor and government, under the delusion that dictatorial power will be used reasonably if it is preached at and cajoled."

Here the essential question is raised: how far is liberalism, in any legitimate sense of the word, compatible with the increasing aggrandizement of the state for even the best of purposes? Not at all, was the answer given by a small but powerful group of writers who saw freedom itself imperilled by the growing statism of the modern world. Prominent in this group was F. A. Hayek of London university, whose book *The Road to Serfdom* (1944) produced a very sharp debate. Hayek's defense of the free competitive economic system owed much to the work of his former colleague in the University of Vienna, Professor R. von Mises, whose *Bureaucracy* (1945) gave a broad general backing to the thesis. Their case was supported by other economists, including Henry Hazlitt and Professor Lionel Robbins, who, while not as inflexible as the two first-named, argued the superiority of a voluntary to a controlled economic order. The argument asserted that once the principle of free competitive pricing is abandoned, all decisions as to the distribution and production of goods and services become arbitrary; i.e., dependent on the *a priori* opinions of some person or group who must necessarily enforce their own ideas because there are no longer any objective criteria. There is no denying the faults and follies of free enterprise guided by the quest for profits; but it is submitted that even if government were all-wise and perfectly disinterested, the dethronement of the "consumer as king" would entail a loss of freedom for which nothing could compensate, and nothing could disguise.

Here we have a distinct echo of Herbert Spencer's attack on the type of radical who "seems under the impression that so long as he has a good end in view he is warranted in exercising over men all the coercion he is able." And it is interesting to recall Spencer's forecast: "The function of Liberalism in the past was that of putting a limit to the powers of kings. The function of true liberalism in the future will be that of putting a limit to the powers of Parliaments." (From *The Man Versus the State* by Herbert Spencer. Published by The Caxton Printers, Ltd., Caldwell, Idaho. Used by special permission of the copyright owners.)

The challenge thus thrown to the neo-liberals was also related to the controversy about deficit financing as preached and practiced by the followers of Professors John Keynes and A. H. Hansen. The contention that public debt is essentially different from private debt, and may properly be manipulated with the cardinal aim of controlling the economic life of the nation, tended, whatever its merits, to strengthen the cause of the statists. On the opposition side were ranged such veteran financial authorities as J. T. Flynn, H. H. Moulton, and Garet Garrett; but they had to cope not only with the technical arguments advanced, but with the fact that deficit financing was one of the tools

relied on by the advocates of the "full employment policy." In this policy it is the duty of government to ensure that at all times anyone who wants a remunerative job can find one (there was a curious lack of reference to France in 1848) and if necessary to provide the job itself. This policy in turn reinforced the demand for a "planned economy"; and the appeal of the planned economy resided not only in the promise of full employment, but in the very reasonable contention that government control could provide, or command, a more desirable assortment of goods and services than the voluntary system. What such planning would mean was clearly indicated by Max Lerner, in his book cited above, in terms that Sir William Beveridge would have entirely endorsed: "Democratic planning may be defined as the technical coordination, by disinterested experts, of consumption, production, investment, trade, and income distribution in accordance with social objectives set by bodies representative of the majority." One may ask what happens to the minority, and how large or small it is supposed to be; one may make mental reservations about the supply of "disinterested experts"; one may speculate as to what will happen when the opinions of the experts as to what is feasible conflict with the demands of the majority for what it deems desirable—such as simultaneously more benefits and lower taxes: the fact remains that this ideal is especially attractive to a pure democracy in which most people imagine that it is only a minority that will be marshalled and mulcted; and the decisive question for liberals is simply whether the price is too high. The issue is confounded by the insistence of both proponents and opponents on calling themselves liberals.

British Liberalism.—The issue came to a head in the British Liberal party's campaign of 1945. At its Feb. conference the party had officially adopted—not without strong dissent from such older liberals as F. W. Hirst—the so-called second Beveridge Report (*Full Employment in a Free Society*); thus categorically reversing the opposition to a "planned national economy" officially expressed as recently as 1942. In Sir William Beveridge's ambitious project for the welfare state, the full employment thesis was unreservedly adopted and it was declared that "the State cannot undertake responsibility for full employment without full powers." All major economic decisions are assigned to the government, including the level of prices and wages, the quantity of savings and the employment of private capital. It becomes the primary business of the state at all times to ensure "adequate total outlay," and "under the conditions envisaged in this Report, probably not more than 25 per cent of the total national investment will be accounted for by private manufacturing industry." The future of free initiative, and the opportunity for venture capital to create, own or manage new facilities, are left on the knees of the gods (or the experts); for while Sir William pays perfunctory homage to the customary political liberties, his list "does not include liberty of a private citizen to own means of production and to employ other citizens in operating them at a wage. Whether private ownership of means of production to be operated by others is a good economic device or not, it must be judged as a device." (Material in quotation marks is reprinted from *Full Employment in a Free Society* by William H. Beveridge, by permission of the publishers, W. W. Norton & Company, Inc.; copyright 1945.) In return for this wholesale surrender of economic liberty the electorate was promised full employment and "cradle-to-grave" security;

but whether the program could pass muster as liberalism was open to question. Apparently the voters thought not, to judge from the disastrous defeat of the Liberal party in the July 1945 elections. It would appear that people who really desired this degree of "planning" and state dependence logically voted for the Socialists, while those who did not were thrown into the Conservative camp; the Conservatives had in fact embodied a large measure of liberal economic policy in their revival of tory democracy. It would also appear, from a comparison of the voting returns with the membership of the new house of commons, that the country as a whole was not nearly so collectivist as the leaders of the Liberal party in 1945 had assumed. The party polled, on the Beveridge platform, a mere 10% of the popular vote; it is a safe guess that it would have done at least as well, and probably better, on a platform more consonant with strictly liberal principles. Once again, the false assumption that the only practical alternatives are statism and *laissez-faire* amounted to a betrayal of liberalism.

Liberalism and Foreign Policy.—With the liberal distrust of the state so largely undermined, in both theory and practice, on the domestic front, developments on the international front during and after World War II gave even less encouragement to short-run optimism. It could hardly be denied that the doctrines of free trade and nonintervention are cardinal to the liberal tradition; but in this sphere also "neo-liberalism" showed itself willing to make fateful concessions.

The wave of economic nationalism launched in the 1920s, heightened by the U.S. tariff of 1930, overwhelmed the last vestiges of British free trade in 1932. The policy of bilateral agreements won the support of many British liberals as the second-best, but only practicable, alternative; and the consolidation of the sterling area had its merits as an alternative to isolation. In the United States the Hull policy of reciprocal trade agreements embodying the most-favoured nation clause was both too little and too late to stem the restriction of free economic intercourse; and through the 1940s Britain waited in vain for a general reduction of tariff barriers on the part of the world's great creditor nation. Since national states superseded private persons as the principal bargaining agents, considerations of national power and interest increasingly controlled the course of events; in a changing world these had never led to stable or harmonious combinations, nor was there any reason to suppose that they would. During and for some time after the period of military hostilities, the use of unrestrained economic coercion against both neutral states and private firms operating in neutral countries left little vestige of either public or private international law as such law had previously been understood. The struggle of the rival power systems dominated all important decisions, and the assumption of the San Francisco charter that justice and the will of the big powers would coincide merely raised the question as to how justice would fare when the big powers failed to agree.

Law as the will of the stronger had never been a liberal conception, because it lacks inherent universality. There are times and occasions when it acquires circumstantial justification, on the assumption that any order is better than none; but from the practical as well as the ideal standpoint all order must be judged according to whether it releases and fosters, or thwarts and threatens, free human potentiality. In the endless task of adjusting rival group interests, a looser system may therefore be preferable to a tighter one. The Franco-U.S. tendency to extend quasi-legal procedures over the sphere of political and diplo-

matic operations is of doubtful validity, and the opening it affords to endless coercion, while attractive to academic minds, is in fact no short cut to harmony. Law for the liberal must always rest on truths that are self-evident; *i.e.*, such as to win the voluntary assent of all enlightened men. That is the basis of both the Roman *jus gentium* and the mediaeval *jus naturale*; and the process of enlightenment, which is long and difficult, is of more promise than the process of coercion, which always looks quick and easy to the possessors of the latest lethal apparatus.

Nationalism and the nation-state were liberal causes a hundred years before, when they meant actual liberation from external coercion. They lingered as such in the mind of Woodrow Wilson, under very different circumstances. The negative case survived in a few instances; but J. Pilsudski was no Giuseppe Mazzini, and Eduard Beneš no Cobden. With the extension of technical and cultural intercourse, "the national community," says A. J. Toynbee (*A Study of History*, vol. 5, Oxford University Press) "is the social prison-house in which our modern western souls are incarcerated." The nation-state, following the precedent of other declining institutions, now tended to ossify, acting far more in a restrictive than in an emancipatory sense. The history of the decade 1937-46 gives no evidence whatever that highly centralized or collectivized states were more altruistic in their outlook than any other kind. Leagues of nation-states are likely to fail as leagues of city-states failed, and for the same reason. Liberals must therefore be sceptical of every policy that tends to increase the dependence of the masses, economically or emotionally, on a type of social organization that is clearly confronted by the writing on the wall.

It is not to the state as such, but to its increasingly monistic tendency, that true liberalism stands opposed. A healthy community informed by a common ethos develops many types of social organization and purpose. Among these the state may usefully serve a tutelary as well as a normative function, not only ensuring minimum standards of justice and decency, but demonstrating what can be done by disinterested organization in both economic and cultural spheres where other means fail. So held Adam Smith; and the rule is especially relevant where popular culture is exclusively controlled by profiteers; but only within such limits as exclude general coercion. To this British liberalism had for many years subscribed; and the varied types of public corporation successfully devised and operated in Britain may in time form the basis of that functional internationalism which is the only alternative to Armageddon. It is significant that not only in economic affairs, but in the arts and sciences, many of the world's ablest men were being confronted, and exasperated, by the obstacles placed in the way of a working world community by the fears and ambitions of the militant local units. On this front history continually repeats itself, offering the same ineluctable choice between emancipation and extinction.

In a direct democracy there is always the risk that such terms as peace, law, freedom, justice, masquerading as ends, may be in fact mere words, and being abstract may be invoked to justify means that run counter to whatever substance there is in them, since direct democracy favours passion and self-interest rather than thought. Liberals themselves are in constant danger of being seduced by abstractions. It is the paramount duty of modern liberalism to devise and propagate, in concrete form, types of supernational co-operation through which the powers and aspirations of modern man may be fulfilled in wider life rather than indiscriminate death. The task is urgent. (See

also DEMOCRACY; EDUCATION; PHILOSOPHY; RELIGION; SOCIALISM.)

BIBLIOGRAPHY.—In addition to the works mentioned in the text, the following shed useful light on various phases of modern liberalism: Sir H. Slessor, *History of the Liberal Party* (1944); F. W. Hirst, *Principles of Property* (1945); B. Wootton, *Freedom under Planning* (1945); A. J. Nock, *Our Enemy the State* (1946); R. Niebuhr, *The Children of Light and the Children of Darkness* (1944); E. Brunner, *Justice and the Social Order* (1946). (W. A. OR.)

Liberal Party, Great Britain

In the general election of 1935, British Liberalism suffered yet another in its long series of reverses.

The Liberal parliamentary party (as distinct from the Liberal Nationals who supported and were represented in the Baldwin and Chamberlain governments) were reduced to only 18 members in the house of commons. The weakness of the party machine was such that Liberal candidates had made their appearance in barely a quarter of the constituencies. It was abundantly clear that a national organization which could rely neither upon the support of the trade unions nor, to any appreciable extent, upon the assistance of the wealthy and leisured classes was grievously handicapped. Moreover, the process of newspaper amalgamation in the interwar years, which had resulted in the disappearance of many provincial newspapers of Liberal views, had made it increasingly difficult for the Liberals to propagate their views or even remind the electors of their existence.

Nevertheless, from 1935 until the fall of the Chamberlain government in 1940, the Liberal party succeeded in playing a part out of all proportion to its apparent strength and influence. This was due not to any revival of Liberal sentiment among the electors but to the performance of its parliamentary representatives. The Liberal leader, Sir Archibald Sinclair, had entered politics in the early 1920s under the aegis of Winston Churchill and had always remained in fairly close touch with his former chief. Under his guidance, the Liberal opposition became increasingly associated with Churchill's resistance to the Chamberlain policy of appeasement. They also adopted a very similar attitude toward rearmament. On a series of occasions between 1936 and 1938, they initiated debates on issues of national defense and particularly on the need for more rapid expansion of the R.A.F. The most important of these occasions was on Nov. 17, 1938, when, in an amendment to the address, they called for the immediate setting up of a ministry of supply. In the face of a hostile majority they met with little or no success. They could, however, claim that their attitude was abundantly justified by events.

At the outbreak of World War II, Sir Archibald Sinclair was invited to join the government. With the full approval of his followers, he refused. Liberals, both inside and outside parliament, were distrustful of Neville Chamberlain and doubted his capacity to prosecute the war. Sir Archibald Sinclair was the first political leader publicly to attack the manner in which the Norwegian campaign had been conducted. His speech was the prelude to the debate in the house of commons a week later which brought about Chamberlain's resignation.

In the new administration formed by Churchill, the Liberal party was represented. Sir Archibald Sinclair became secretary of state for air, while three of his followers received junior appointments. During the next five years the Liberal party became almost completely dormant.

The rank and file were often impatient at the party truce which prevented them from putting forward Liberal candidates at by-elections, and they were occasionally critical of the government's plans for postwar reconstruction. But on all matters affecting the prosecution of the war they gave consistent support to the prime minister. The only outstanding event in the party's history during this period was the adherence of Sir William Beveridge and his return to the house of commons as a Liberal member in 1944.

The collapse of Germany was followed within a few days by the end of the coalition. A general election followed for which the Liberals were ill-prepared, and they were able to contest less than half the constituencies. The result was disastrous. Not only were the Liberal members in the house of commons reduced to 12, but nearly all the leaders, including Sir Archibald Sinclair and Sir William Beveridge, were defeated at the polls. The party's 2,250,000 votes should have entitled it to substantial representation in the new parliament, but the prevailing electoral system of single-member constituencies almost invariably resulted in minority parties being considerably under-represented.

It was generally assumed in both the Conservative and Labour camps that this débâcle marked the end of Liberalism as an organized force in British politics. But the Liberals themselves, and especially the younger members of the party, stubbornly refused to accept the verdict as final. With an optimism which was remarkable in the circumstances, they set about the reorganization of their party machine and the rebuilding of their movement.

(D. M. F.)

Liberia

A Negro republic lying on the west coast of Africa at the lower curve of the continental bulge, Liberia borders the narrowest part of the South Atlantic bottleneck and is the closest area of Africa to the continent of South America. Its area is about 43,000 sq.mi. Because of the inaccessibility of the vast, unmapped hinterland provinces, no complete and accurate census had ever been made. However, the population was variously estimated at from 1,500,000 to 2,000,000 in 1946—all Negro. About 12,000 were Afro-American (called Americo-Liberians) and comprised the aristocracy and ruling class. The remaining large majority was made up of many indigenous tribes. Except for the coastline (350 mi.) and the short boundary of Sierra Leone on the northwest, Liberia is surrounded by French territory: French West Africa on the north and east, and Ivory Coast on the southeast. It is at Liberia's southern tip that the west African coast turns sharply eastward along the Gulf of Guinea. During the decade 1937-46, the presidents were Edwin J. Barclay (Jan. 1936-Jan. 1944) and William V. S. Tubman (after Jan. 1944). The chief city and port of entry is Monrovia, the capital (pop. 10,000), situated about midway on the coastline. The towns next in size and importance, with populations of only a few hundred, are, likewise, on the coast and ports of entry. The most important of these are Robertsport, Marshall which serves primarily the U.S.-owned rubber plantations a few miles inland, Grand Bassa (also called Buchanan) and Cape Palmas. Possibly only one inland town is of size and importance worth mentioning. It is Kakata, 50 mi. from Monrovia on the Sanoquelli road. Its population is unknown since it is the stopping place of so many transients. For many

years it marked the end of the road and so became the convergence for hinterland traffic (foot) headed for the markets of Monrovia. Situated on the Du river, used by the Firestone Plantations company for shipping latex down to the coast, Kakata became a busy and thriving trading center for native, European and Syrian merchants. The coastline being flat and sandy, Liberia was deprived of a single good natural harbour. Each of the ports mentioned had only an anchorage, with the exception of Monrovia, where the U.S. government at the end of the decade was dredging the shallow though ideally shaped harbour to provide for alongside docking of the European and American ships regularly stopping there.

* * *

As THE DECADE 1937-46 opened, Liberia was emerging from the struggles and stagnant isolation of its first 90 years as a nation. Credentials had been presented to President Barclay by an economic adviser, a medical adviser (both Polish), and administrative, educational, and military advisers, all from the United States. The two Polish officials retired in 1937. A resident Hungarian physician succeeded to the medical advisership, and the functions of the economic adviser were absorbed by the U.S. administrators. In all departments some improvements were noted, but the national phobia of being made into a "pseudo-European state," voiced in official speeches and supported by the press, thwarted real progress and was gradually making futile or ineffective the efforts of all advisers except, perhaps, those of the military expert. (The U.S. financial adviser and his assistants were inviolate, being permanent and not a part of any short-term scheme of assistance.) The stalemated situation came to a sharp turning point in June 1942 with the arrival on Liberian soil of several thousands of U.S. Negro troops. They were the announcement to a world at war of a defense agreement between the United States and Liberia which had been signed in March of that year. This task force built roads and constructed airports and other installations for the use of the bomber ferry command feeding planes to North Africa, the near east, Russia, India and China. It was also important that the United States' largest source of raw rubber be protected.

The importance of Liberia's strategic location brought about a new program of assistance and development toward which the U.S. government agreed to advance \$12,500,000 for the construction at Monrovia of a port and port works which would aid in Liberia's advancement as well as provide an important U.S. naval base on the west African coast. The agreement for the port was contracted between the two governments on Dec. 31, 1943. At the request of the Liberian government, the services of several technical experts were loaned during 1945 to investigate iron deposits near Monrovia, to assist in the development of agriculture, to plan a program of public health and sanitation and to study the country's natural resources. The possibility of preparing a general plan of economic development was contingent on the result of these findings. Grants by the United States government in the realm of cultural relations were made to the Booker T. Washington institute and aid was given to training nurses for the public health mission.

The need for a military adviser had been accentuated by circumstances surrounding the quelling of a four-year revolt by the native King Nimleh in 1937 when he was captured in Oct. of that year. In that same month the American Advisory Committee on Education in Liberia (made up of representatives from each of the philan-

Liberia: Statistical Data

thropic groups aiding Liberia) requested that the department of state in Washington investigate European propaganda against Liberia and the unrest stemming from the earlier suggestion that Liberia be mandated to Germany. In Nov. President Barclay, in the opening session of the legislature, stated that the native uprising headed by King Nimleh had been instigated by European powers. In Dec. 1937 Great Britain accorded full recognition to the Liberian republic. The enlarged army, the new airports and the naval base all promised greater efficiency in Liberia's defense. With the construction of the modern harbour at Monrovia well under way, 100,000 ac. of rubber plantations producing for export, a more closely coordinated plan of assistance functioning, new roads in use and intercounty air mail and passenger service, Liberia in the short decade of 1937 to 1946 strode with seven-league boots across many times that number of years in progress to a state of development which augured well a still greater place of importance.

Libraries

The decade 1937-46 was one of the most significant in the history of United States libraries. It is a truism to say that World War II marked the end of an era and the beginning of a period of change. The library, no less than other educational and social institutions, was affected in many ways.

Two developments were especially noteworthy. (1) There was a greater co-operative effort in meeting common problems; previously there had been much discussion of co-operation but considerable reluctance to act except in limited fields. (2) There was a tremendous demand for books and information in spite of the withdrawal of many persons from civilian pursuits during the war years. Books were required to win the war. Thousands in the armed forces, through camp libraries for training and recreation, became aware of the value of books. This introduction to modern library service, added to the large enrolment of veterans in schools and colleges, had begun to make itself

felt by 1946. The increased use of libraries was bound to affect their growth and development.

It was encouraging to note the comparatively rapid recovery of libraries from the effects of reduced appropriations and increased use during the depression years. To what extent this recovery was owing to the prospect of war and preparations for national defense it would be difficult to say. By 1937 salaries, which had been cut in many libraries during the years from 1930 to 1935, had been restored, and in some cases increased, but in general appropriations for tax-supported libraries did not increase in 1937, 1938 and 1939 to the extent hoped for in view of the improved economic outlook. The diminishing returns from invested funds was a matter of growing concern to libraries supported in whole or in part by income from endowments. Reduced appropriations and diminished income forced retrenchment on many libraries; this meant depleted book stocks, curtailed service, and in some cases reduced salaries and unemployment. Although most of the 1938 graduates of library training schools had obtained positions by the end of the year, it was estimated in 1939 that 4% of the active librarians (12,124) were unemployed.

The forced economies of the depression years led to a fresh examination of the techniques employed with the result that many routine processes were simplified. Renewed attention was given to various co-operative efforts. The change in many chief librarianships, however, was the chief cause of the numerous surveys of particular libraries made by outside experts. These critical studies of organization and practice were on the whole beneficial. Archibald MacLeish, during his term as librarian of congress, accomplished the difficult task of a thorough reorganization of the national library.

Salaries for most professional librarians had always been distressingly low, having regard to the ability and preparation expected. From 1943 to 1946, however, it was encouraging to note that better salary schedules (in addition to cost-of-living bonuses) were reported by many tax-supported libraries. The proposed new classification and salary plans for the Library of Congress were heartening, but the plight of libraries not maintained by public funds was serious. It should be remarked, however, that such salary increases as were provided did little more than offset rising prices.

By 1942 the most serious problem was the increasing difficulty of filling staff vacancies. Men, from trained specialist to janitor, were serving in the armed forces, and both men and women left library positions for work in

industry or in government service. Staff losses in all grades were so serious that during the war years many libraries were forced to curtail activities and shorten hours. Losses were greater at the clerical than at the professional level. The situation at the end of 1946 was still critical. Inadequate salaries were largely responsible, although another factor in the shortage of trained librarians was the smaller enrolments from 1941 to 1945 in library schools. In 1946 there were perhaps 3,500 fewer trained people than there would have been had the enrolments each year merely maintained the point reached in 1940. This was closely connected with the entire question of recruitment and training, a matter that was frequently discussed by librarians during these years.

On Jan. 5, 1937, the 50th anniversary of the establishment of the first training school for librarians was commemorated. This was a School of Library Economy opened in 1887 by Melvil Dewey, then librarian of Columbia college, New York city. The 1936-37 report of the board of education for librarianship (American Library association) listed 26 schools of various types accredited by the board as meeting its standards; all were connected with teaching institutions. A total of 18,911 persons had been graduated since 1887 from all library training schools, including those no longer in existence.

In 1936-37 the total enrolment was 1,345, and the number of graduates 900. The number of students rose steadily, and reached its peak in 1940 with 2,159 in 30 accredited schools. From 1941 to 1944 the enrolment declined more rapidly than it had increased from 1937 to 1940. In 1944 there were 1,062 students registered in 34 schools. In 1945 the number had risen to 1,348—three more than were listed in 1937. In 1946 the enrolment in 36 accredited schools was 1,547. It was obvious that a shortage of trained personnel would be felt for a long time.

The growth of libraries after 1910 far outstripped progress in methods of training librarians. During the decade 1937-46 the difficulty of finding men of exceptional ability, technical competence, and experience for the chief librarianships of large libraries was evidence that a satisfactory method of selecting and training library administrators had not yet been devised, although the teaching of technical subjects had been greatly improved. Too many top positions were perforce filled by the appointment of men who, though able, lacked practical experience in the management of large libraries. The scholarship funds provided by individual schools, and the appropriations for the United States and Canada made by the Carnegie corporation from 1929 to 1942 for grants-in-aid for advanced study and research, while helpful, were not the answer to the question of how to attract superior ability. J. L. Wheeler's excellent report, *Progress & Problems in Education for Librarianship* (1946), prepared for the Carnegie corporation, summarized much of the discussion about training. Recruiting and revision of curricula were two problems that received special attention. The series of library institutes organized in 1936 and thereafter by the University of Chicago graduate library school for librarians in service proved helpful, and the published addresses were valuable contributions to professional literature.

The Carnegie corporation continued in other ways to aid education for librarianship. In 1937-38 a grant of \$250,000 was made to Columbia university to be used in

Valuable U.S. documents, were returned to public view in the Library of Congress on Oct. 1, 1944, for the first time since Dec. 1941, when they were removed from the capital for safekeeping. Here marines are shown guarding Thomas Jefferson's first draft of the Declaration of Independence

part (\$150,000) for the endowment of a professorship (the Melvil Dewey Professorship of Library Service) and in part for maintenance. In 1939, the corporation also made endowment grants to the library schools of Pratt Institute and the University of Denver, Colo.

Libraries in Wartime.—During 1940 and 1941, libraries gave much attention to the part they could take in the preparations for U.S. national defense, and also to the effect of the emergency upon their normal service. A survey of the resources of research libraries in the fields of science, technology and economics, the provision by public libraries of technical books to meet the demands of workers in defense industries, the establishment of information centres for civilian defense, co-operation with the libraries being organized in camps and elsewhere for the army and navy, were some of the special activities in which librarians were engaged. From Pearl Harbor to V-J day, U.S. libraries large and small did all in their power to further the prosecution of World War II by supplying books and information required by the armed forces, by government, by industry, and, not least, by civilians. That books and libraries were essential in total global war admitted of no argument.

The army library service, maintained on a reduced scale since 1919 at government expense, was rapidly expanded, and became a branch of the war department's special service division. Post, camp and hospital libraries, supervised and largely staffed by professionally trained librarians, were established. Travelling libraries, especially for overseas use, were formed. The navy's library organization in the charge of an experienced librarian was under the direction of the bureau of navigation. In addition to millions of books purchased with government funds (from 1940 to 1946 more than 14,000,000 books were distributed to army libraries in the United States), and to millions more supplied by the National Council on Books in Wartime for transport and overseas use, more than 10,000,000 volumes were distributed through the "Victory Book campaigns" to the armed forces and the merchant marine. The Victory Book campaigns of 1942 and 1943 were sponsored by the American Library association, the American Red Cross and the United Service organizations.

One of the remarkable publishing achievements of the war was the issue of the "armed services editions," or, "council books." These compact, paper-covered reprints of late fiction and nonfiction, popular classics and other books of general interest, were designed for overseas use. Forty titles were published each month. In 1945, at the peak, 130,000 sets, or more than 5,000,000 volumes were issued monthly.

As soon as war was declared by the United States, many libraries removed valuable books and records to places of comparative safety in view of possible bombing. The microfilming of important card catalogues was considered by some libraries. The National Resources Planning board issued (1942) a manual, *Protection of Cultural Resources against the Hazards of War*.

Wartime demands gave a new impetus to the use of microfilm in copying materials to be sent to all parts of the world. The use of "V-mail" letters to the armed forces familiarized the general public with the advantages and possibilities of microfilm. By 1944 the importance of microfilm for the reproduction and preservation of research material was generally recognized. Fremont Rider in *The Scholar and the Future of the Research Library*, proposed microprint for reproducing books on the backs of catalogue cards. Whether or not his argument was accepted, it was not improbable that certain classes of little-

used research material might some day be reproduced by microprint. Costs of preparation and storage would, obviously, be materially reduced.

After the outbreak of World War II, efforts to obtain European books and periodicals, particularly from Germany, were unceasing. Finally it was arranged that, until normal commercial channels were reopened, the Library of Congress, with the help and approval of the state department, would, on behalf of U.S. research libraries, purchase books published from 1939 to 1945, mainly in Germany, France and Italy, and would allocate the materials so secured with the aid of a joint committee representing the groups interested, the expenses to be shared by the participating libraries. A purchasing mission sailed for Germany in Dec. 1945, and by the middle of 1946 the distribution of books was begun.

The publication of the second edition of the *Union List of Serials in Libraries of the United States and Canada* (1943, *Supplement*, 1945), and the second "census" of *Incunabula in American Libraries*, edited by Margaret B. Stillwell, in 1940, were events of importance. Both were co-operative undertakings. Another notable accomplishment was the reprinting by photo offset process of the *Library of Congress Catalog of Printed Cards*, 1942-46, in 167 volumes. This was initiated and carried through by the Association of Research Libraries.

Benefactions.—Of the many gifts made to libraries during the decade the following merit special attention. In 1940 Dr. Albert A. Berg of New York presented a valuable collection of English and American literature to the New York public library in memory of his brother, Dr. Henry W. Berg. To the original gift was later added the fine collection of books and manuscripts purchased by Berg from the estate of W. T. H. Howe. In 1941 the Berg collection was further enriched by the library gathered by Owen D. Young, presented jointly by Young and Berg. In 1943 Lessing J. Rosenwald presented his magnificent collection of manuscripts and early printed books to the Library of Congress. The George Arents collection of books relating to tobacco was deposited in the New York public library by Arents in 1944. This remarkable collection of more than 4,000 pieces included rare Americana and Elizabethan literature containing references to tobacco.

Late in 1946 the Linda Hall library was opened in Kansas City, Mo., in the remodelled Hall residence. This special scientific and technical library was established as a memorial to his wife by Herbert F. Hall (died 1941) who left a trust fund of \$6,000,000 for this purpose. The collections (more than 62,000 volumes) of the American Academy of Arts and Sciences of Boston, Mass., established in 1780, were purchased as the nucleus of the new library.

The Carnegie corporation and the Rockefeller foundation continued generous aid to many library activities that could not otherwise have been undertaken. Of special importance were the grants made by the Rockefeller foundation to the American Library association for the purchase of U.S. books and periodicals for distribution to libraries in war areas.

Library Buildings.—From 1937 to 1941 many new library buildings were opened. Because of the almost complete stoppage of construction after 1941, except that required for war purposes, there was little building from 1942 to 1946. In anticipation of an extensive program of public works many libraries made detailed plans for new building, or additions to existing structures after the war, but

little was done in 1946 owing largely to the continuing shortage of materials.

It was instructive to note that the majority of buildings completed were for college and university libraries, most of them, however, for small colleges in every section of the United States except New England. The years from 1937 to 1939 were the most "active"; in 1938, for example, new buildings, to mention only a few, were completed or dedicated at Albion college, Albion, Mich.; Franklin and Marshall, Lancaster, Pa.; St. Bonaventure, St. Bonaventure, N.Y.; Salem, Winston-Salem, N.C.; Willamette, Salem, Ore. Among the new university library buildings opened between 1937 and 1941 were those of the University of Oregon at Eugene, the University of Virginia at Charlottesville (cost \$950,000), the University of Alabama at Tuscaloosa (cost \$600,000) and the Howard-Tilton Memorial library at Tulane university in New Orleans, La. (cost \$500,000). The dedication late in 1941 of the Joint University Library in Nashville, Tenn., marked a significant development in library co-operation. The new library, jointly owned and directed, served the George Peabody College for Teachers, Scaritt college and Vanderbilt university.

The reason for the remarkable number of college library buildings constructed during these years were: (1) old and inadequate existing buildings; (2) increased enrollments; (3) changed methods of teaching; and (4) the stimulus of grants made by the Carnegie corporation from 1929 to 1938 to many institutions for the purchase of books. The influence of this last factor in strengthening and improving small college libraries was considerable.

The larger university and research libraries in the United States had doubled in size every 20 years. Growth of collections outstripped construction of buildings. Even farsighted librarians planning buildings erected after 1900 failed to foresee the geometrical rate of increase, and there were few buildings more than ten years old that were not overcrowded. Because of the high costs of construction and administration it was not practicable to build new libraries every generation.

One solution suggested was a storage library for little-used books. Harvard, the Boston public library and other libraries in the Boston, Mass., region organized the New England Deposit library, a nonprofit corporation, and a suitable building with a reading room was constructed in 1941 at Allston, Mass., on land given by Harvard. Maintenance charges and construction costs were to be met by income from the rental of space to the participating libraries. The Iowa State college, Ames, also in 1941, constructed a steel storage building (cost about \$20,000; capacity 150,000 volumes) to house seldom-used books. The other plans made by Metcalf to relieve the overcrowding of the Widener library were significant. The Houghton library, the gift of Arthur A. Houghton, Jr., of Corning, N.Y., a graduate of Harvard and a collector of distinction, was opened early in 1942. This small but charming structure, adjoining the Widener building, was planned for the safe storage, convenient consultation, and attractive display of Harvard's rare books and manuscripts. In 1945 Harvard announced the gift of \$1,500,000 from Thomas W. Lamont of the class of 1892 for the construction of an undergraduate library to be erected not far from the Widener and Houghton libraries.

Late in 1945 ground was broken for the new Princeton university library, to be named the Harvey S. Firestone Memorial library in recognition of the gift of \$1,000,000

to the building fund from the Firestone family. The new building was expected to cost \$3,500,000 with space for 2,000,000 books. Plans were also being made for new buildings at the University of Pennsylvania, Philadelphia, and at the Massachusetts Institute of Technology, Cambridge.

Few public library buildings were constructed between 1937 and 1941, and none from 1942 to 1946. The Rundel Memorial building of the Rochester (N.Y.) public library was opened in Oct. 1936. The cost was approximately \$3,000,000, of which \$1,000,000 came from the bequest of Morton W. Rundel. It was similar in plan to the Enoch Pratt free library, Baltimore, Md., opened in 1933. The Rochester library is mentioned here because it was really the first to adopt the simple, practical, almost revolutionary plan designed by Joseph L. Wheeler for the Enoch Pratt, a plan that had influenced much building. The fine Ingersoll Memorial building, (cost \$2,000,000), the central library for the Brooklyn, N.Y., public library, was occupied in 1939, an uncompleted wing of which had been begun more than 20 years earlier. The Fort Worth (Texas) public library (cost \$400,000; capacity 180,000 volumes) was also opened in 1939. The same year saw the completion of the main building of the Toledo (Ohio) public library (cost \$2,000,000).

In Washington D.C. the Library of Congress annex was occupied in 1939. With an estimated capacity of 10,000,000 volumes, it added 249 miles of shelving and 20 acres of floor space to the national library, overcrowded for many years. The Franklin D. Roosevelt library at Hyde Park, N.Y., was dedicated by the president on June 30, 1941. Organized primarily to house the official and private papers of President Roosevelt, it was built on land given by the president and his mother. The cost of the building was \$350,000, contributed by citizens of the entire nation. The library was under the administration of the archivist of the United States.

Size and Growth of Collections.—In 1937 there were 14 libraries containing more than 1,000,000 volumes each. Excluding the Library of Congress and the New York public library, the latter consisting of an endowed reference or research library and a tax-supported but quite separate circulation department, the remaining 12 were equally divided between university and public libraries. Of the university libraries two, Illinois and California, were state-supported; the remaining four were those of Harvard, Yale, Columbia and the University of Chicago. Cleveland possessed the largest public library, followed by Chicago, Ill., Boston, Mass., Los Angeles, Calif., Cincinnati, Ohio, and Brooklyn, N.Y.

In 1946 there were 22 libraries that possessed 1,000,000 or more volumes each. Accurate and comparable figures for 1946 were not available, and in the absence of the tables usually prepared by the American Library association but discontinued in 1945, the statistics were taken from the *American Library Directory*, 1945. Excluding again the Library of Congress, the New York public library, and also the Army Medical library in Washington D.C., credited with possessing more than 1,000,000 volumes, the remaining 19 included 11 university and 8 public libraries. The five university libraries that had passed the 1,000,000 mark since 1937 were the state universities of Minnesota and Michigan, Cornell, Princeton and the University of Pennsylvania. The Detroit public library and

New York public library steps where daily rallies between Jan. 19 to 31, 1942, yielded about 600,000 books for donation to the U.S. armed services

the Carnegie library of Pittsburgh, Pa., were the only two public libraries that had "graduated" into the "million-volume" group within the decade. Two other libraries (the New York state library at Albany and the St. Louis, Mo., public library) might be classed as runners-up, since their holdings were rapidly approaching the million-volume figure. Of these 22 libraries, 8 possessed more than 1,000,000 but less than 1,250,000 volumes, 3 from 1,250,000 to 1,500,000, 5 more than 1,500,000 but less than 2,000,000 volumes. The public libraries of Chicago and Cleveland possessed more than 2,000,000 books but less than 2,500,000. Yale counted 3,365,400 volumes. Harvard (all libraries), and the New York public library (both reference and circulation departments) each possessed more than 4,500,000 volumes. The Library of Congress, as the national library, properly topped the list with a recorded total of 7,281,681 volumes.

These 22 libraries contained roughly some 46,000,000 volumes. Because of duplication of many books it would be difficult to hazard a guess as to the number of separate titles represented. In any case the total was impressive evidence of the growing resources for study and research in large U.S. libraries. In general the university and reference libraries increased at a more rapid rate than the public libraries, not only in the number of volumes, but also in the number of different titles acquired. Public libraries continued to buy many copies of new and standard books, and to discard many volumes that had become worn out, out-of-date and no longer useful. The net increase each year was likely to be smaller than in university libraries.

Librarians.—No decade within memory witnessed more changes in the librarianships of the major U.S. libraries. Herbert Putnam, librarian of congress since March 13, 1899, retired Aug. 1, 1939, becoming librarian emeritus. During the 40 years of his librarianship he had made the Library of Congress in all but name the national library. On June 6, 1939, President Roosevelt nominated Archibald MacLeish to be librarian of congress. MacLeish, trained in the law, was best known as a poet and the winner of the 1932 Pulitzer prize for poetry. He resigned upon his appointment as assistant secretary of state in charge of public and cultural relations, and was succeeded by Luther H. Evans, who had been chief assistant librarian since Nov. 1, 1940.

Harry Miller Lydenberg retired from the directorship of the New York public library Oct. 1, 1941, and was succeeded by Franklin F. Hopper, chief of the circulation department of the library since 1919. Lydenberg had been a member of the staff of the library since 1896, and director since 1935. *Bookmen's Holiday* (1943), a volume of essays and studies in his honour, was the tribute of some of his friends to his distinguished service to scholarship and to librarianship. Hopper retired Oct. 1, 1946, and was succeeded by Ralph A. Beals, director of the University of Chicago libraries since 1942, and dean of the university's graduate library school since 1945.

Keyes D. Metcalf, chief of the reference department of the New York public library since 1928, was appointed director of the Harvard university library Sept. 1, 1937. He was president of the American Library association in 1942-43. Andrew C. Keogh retired from the librarianship of Yale university in 1938 after 40 years of service, and was succeeded by Bernhard Knollenberg on April 9. Knollenberg resigned in Jan. 1945, and James T. Babb, assistant librarian from 1938, and later acting librarian, was appointed in his place.

Charles C. Williamson, director of libraries and dean of the school of library service of Columbia university, retired June 30, 1943. His great work at Columbia was the organization in 1926 of the school of library service, formed by the merger of the New York state library school at Albany and the library school of the New York public library, the co-ordination of the Columbia libraries, and the planning of the new library building, now named the Nicholas Murray Butler library, the gift of Edward S. Harkness, which was opened in 1934. Williamson was succeeded by Carl M. White, director of the library and the library school of the University of Illinois. At Princeton in 1939 Julian P. Boyd, formerly librarian of the Pennsylvania Historical society, was named in succession to James T. Gerould, retired. M. Llewellyn Raney, director of the University of Chicago libraries since 1927, retired Oct. 1, 1942, and Ralph A. Beals was appointed to the directorship. Four years later (1946) Beals resigned to become director of the New York public library.

On July 20, 1941, William Warner Bishop, librarian of the University of Michigan, retired from the position that he had filled with great distinction since 1915. Dr. Warner G. Rice, professor of English in the university, was appointed director. Bishop was president of the International Federation of Library Associations from 1931 to 1936. The publication of *William Warner Bishop: a Tribute, 1941*, a volume of essays in his honour, attested the affection and respect of friends at home and abroad.

Frank K. Walter, librarian of the University of Minnesota since 1921, retired June 30, 1943, and was succeeded by E. W. McDiarmid, associate professor in the University of Illinois library school. Walter died Oct. 28, 1945. Carl M. White succeeded Phineas L. Windsor, who retired Sept. 1, 1940, after 30 years as librarian of the University of Illinois and director of its library school. Upon White's resignation in 1943, Robert B. Downs, director of libraries of New York university, was appointed librarian. Dr. Otto Kinkeldey, distinguished musicologist and librarian, retired from Cornell university in 1946, and was succeeded by Dr. Stephen A. McCarthy from the Columbia university library.

Donald Coney, librarian of the University of Texas, was appointed to the librarianship of the University of California (Berkeley) on Aug. 1, 1935, in succession to Harold L. Leupp, retired. In 1941, Dr. Charles W. David was appointed director of libraries of the University of Pennsylvania, a position created to co-ordinate the work of the general library of the university, the departmental libraries and the Philadelphia Bibliographical centre.

James I. Wyer, director of the New York state library (Albany) for 30 years, retired in 1938. Robert W. G. Vail, librarian of the American Antiquarian society at Worcester, Mass., since 1930, was appointed to the directorship Jan. 15, 1940. Vail resigned in 1944 upon his appointment (Sept. 1) as director of the New York Historical society (New York city). Dr. Charles F. Gosnell became director of the state library Sept. 1, 1945.

Linda A. Eastman, after 45 years of service in the Cleveland public library, retired from the librarianship in 1938, and was succeeded by Charles E. Rush, who resigned early in 1941. Clarence S. Metcalf, business manager of the library since 1924, was made librarian Nov. 28, 1941. Chalmers Hadley, librarian of the Cincinnati, O., public library since 1924, became librarian emeritus late in 1945, and was succeeded by Carl Vitz, librarian of the Minneapolis, Minn., public library and president of the American Library association in 1944-45. On July 1, 1941, Adam Strohn, librarian of the Detroit, Mich., public library since

Seaman's library aboard a floating repair shop servicing B-29s based in the Marianas during 1945. The shelves were slanted to conform to the shape of the ship's hull

1913, retired. His successor was Ralph A. Ulveling, the associate librarian, who served as president of the American Library association in 1945-46. Arthur E. Bostwick, for 28 years the distinguished librarian of the St. Louis, Mo., public library, resigned March 1, 1938, to become associate librarian. Charles H. Compton, assistant librarian since 1921, was appointed librarian. Bostwick died Feb. 13, 1942. Matthew Dudgeon retired from the librarianship of the Milwaukee, Wis., public library March 1, 1941, after more than 20 years of service. Wyllis E. Wright, appointed librarian of the reorganized Army Medical library, Washington, D.C., July 1, 1945, resigned late in 1946 to become librarian of Williams college, Williamstown, Mass.

Louis R. Wilson retired from the deanship of the University of Chicago graduate library school in Sept. 1942. Joseph L. Wheeler, librarian of the Enoch Pratt free library, Baltimore, Md., since 1926, retired March 31, 1945. The design of the Enoch Pratt library had marked influence on the planning of later public library buildings. Dr. Harrison W. Craver, for many years director of the Engineering Societies library, New York city, retired in 1946. He organized the technology department of the Carnegie library of Pittsburgh in 1900, and was a pioneer in this specialized field of librarianship. He was president of the American Library association in 1937-38.

Great Britain.—During the period 1937 to 1940 there was much activity in library building, largely because of the great expansion of library services of all kinds. More than 220 new or extended central and branch public libraries were opened, the largest being the new central libraries at Bolton, Huddersfield, St. Marylebone and Southampton. In addition to these, the National library of Wales was opened by the king and the new library of the University college, Swansea, by the duke of Kent, in 1937. The same year saw the opening of the Arts Library building of the Victoria university of Manchester, the opening, after reconstruction, of the North library of the British museum, and the laying of the foundation stone of the Roborough library of the University College of the South-West, Exeter, which was eventually opened in 1940. The Harold Cohen library at the University of Liverpool was opened by Lord Baldwin in 1938, and during this year the library of the University of London was transferred from South Kensington to the great new building near the British museum.

After World War II, during which all library building was suspended, the New Bodleian library upon which work had begun in 1930, was formally opened by the king in Oct. 1946.

The establishment of a regional system for the south-west of England was the culminating move in the formation of a great national system of library co-operation, with a common centre in the national central library. England and Wales were then covered by a series of eight regional systems and the London borough libraries inter-lending system. In 1938 a bureau of American bibliography, equipped with a complete set of the Library of Congress cards, was established at the national central library.

Progress was made by public libraries, despite the difficulties and shortages of six years of war. The demand by borrowers was such that total issues of about 230,000,000 from all public libraries in Great Britain in 1938 had risen to more than 300,000,000 in 1946. During World War II the people of Great Britain read more than ever before, but the resources of the libraries were severely taxed. A large proportion of trained personnel was called for national service, the output of new books was much less than in normal times and, more disastrously, many libraries were destroyed or badly damaged by German bombing: 156 libraries sustained complete loss or severe damage and another 280 were less badly damaged. Altogether nearly 1,000,000 books were destroyed in these incidents.

Among those which suffered complete loss of buildings or very serious damage were University college, London, Birkbeck college, the national central library, the London library, the public libraries of Clydebank, Coventry, Exeter, Hampstead, Liverpool, Lowestoft, Plymouth and certain sections of the British museum.

The need for the reconstruction of these libraries and those destroyed on the continent was early recognized and in 1942 the National Book Recovery campaign was launched, which, together with direct donations, was eventually responsible for the recovery for libraries of approximately 1,000,000 books. An Inter-Allied Book centre for the sorting, allocation and dispatch of the recovered books was opened in 1944 and closed at the end of 1946, its great and arduous task completed.

In the first years of World War II, properly organized libraries were not established for the forces but millions of books and periodicals were provided through the services libraries for the men and women of the navy, army and air force. Later many command and unit libraries were set up in Great Britain and the theatres of war. Furthermore, most public libraries provided library service for military camps and isolated units stationed within their area.

Lie, Trygve

Lie (1896–), Norwegian statesman, was born July 16, 1896, in Oslo, the son of a carpenter. A member of the Norwegian Labour party, he studied at the Oslo University Law school and upon graduation in 1919 became secretary general of the party. In 1926, he was appointed to membership in the party's national council as legal adviser; his function was to mediate labour-management controversies. In 1935, he was named justice minister in the cabinet of Premier Nygaardsvold; four years later, he was shifted to the post of minister of commerce.

In the late spring of 1940, after it was apparent that the Germans were going to succeed in crushing Norwegian resistance, Lie fled to England; there he became minister of shipping and supply in the Norwegian government-in-exile and later foreign minister. Politically, Lie refrained from joining either of the great Allied power blocs in the process of formation while World War II was still underway, but he managed to maintain the respect of both the Anglo-U.S. and soviet groups. He headed the Norwegian delegation to the U.N. conference at San Francisco (April-June 1945) and to the U.N. conference in London that opened in Jan. 1946.

Nominated for secretary general of the U.N. security council, he was elected Feb. 1, by a 46 to 3 vote in the assembly. Lie stirred up controversy regarding procedure within the security council itself when on April 16, 1946, he said he questioned the legality of the council's decision to retain the Iranian case on its agenda after both parties to the dispute (the U.S.S.R. and Iran) had asked for its dismissal. A dispute arose as to whether Lie had the authority to intervene in the council's discussions. Subsequently his right to address the council was upheld and the security council empowered him to intervene in any debate before the organization.

An independent, sovereign principality northeast of Switzerland, Liechtenstein lies on the upper Rhine between the former Austrian province of Vorarlberg and the Swiss cantons of St. Gallen and Graubünden. Area, 65 sq.mi.; pop. (census of Dec. 1941) 11,102. Chief town, Vaduz (capital, pop. 2,020). Franz Joseph II (b. 1906) was given ruling authority by his 84-year-old great-uncle Franz I (ruled 1929-38) on March 30, 1938, and after the latter's death was crowned prince on May 29, 1939. The monarchy is hereditary in the male line. The constitution adopted in Oct. 1929 provided for a diet of 15 members elected for 4 years by direct vote on the basis of universal suffrage and proportional representation. Language, German; religion, mainly Roman Catholic; products, corn, wine, fruit, wood and marble; industries, cotton textiles, leather goods and pottery; cattle raising, favoured by the fine Alpine pastures, is highly developed. Postal, telephone and telegraph systems are administered by Switzerland. There is no army, and the taxes are very slight; about a third of the revenue is contributed by the prince; another third comes from the sale of postage stamps to stamp collectors; and there is a considerable revenue from large international corporations which set up their headquarters in the country, pay nominal fees for the privilege and escape the taxes in their own country. A private patriotic association circulated a petition in 1939 to ascertain the wishes of the country as to joining Germany or continuing the economic ties with Switzerland; 95% of the registered voters rejected union with Germany and demanded continued independence. Thanks partly to Swiss protection, Liechtenstein remained neutral during World War II. (S. B. F.)

Lilienthal, David Eli

Lilienthal (1899-), U.S. lawyer and public official, was born July 8, 1899, at Morton, Ill. From 1923 to 1926 he was associated in law with Donald R. Richberg, former administrator of the National Recovery act. Later he was engaged in telephone rates litigation for the city of Chicago. In 1931, as a member of the Wisconsin Public Service commission, he was a spearhead in Gov. Philip La Follette's fight against state power companies. Appointed a director of the Tennessee Valley authority in 1933, Lilienthal was a storm centre of the quarrel in the directorate during 1938. Lilienthal and Harcourt A. Morgan in that year became involved in a bitter dispute with the third director, Arthur E. Morgan. The latter eventually was dismissed by President Roosevelt, who appointed Harcourt Morgan to the chairmanship. Lilienthal later was made chairman (Sept. 1941) and was reappointed to this position in May 1945. He resigned on Oct. 28, 1946, after his nomination to the chairmanship of the U.S. Atomic Energy commission.

Lima Conference, 1938

Lime

Demand for lime during World War II brought a 60% increase in production in the United States. Work first for the defense program and later for the war program culminated in a peak demand of 6,596,615 short tons in 1941 as compared with 4,124,165 tons in 1937 and 3,346,954 tons in 1938. Expansion was most marked in chemical and refractory lime, with a smaller increase in building lime, and a decrease in agricultural lime. By 1942 the bulk of the war construction work was finished and the consumption in building was cut almost in half, diverting more lime to industrial uses, which continued to expand up to 1943 and 1944, declining in 1945.

Salient Statistics of the U.S. Lime Industry

	(Thousands of short tons)				
	1937	1939	1941	1943	1945
Production	4,124.2	4,254.3	6,079.4	6,596.6	5,920.6
Quicklime	2,822.9	2,936.3	4,489.2	5,283.2	4,565.6
Hydrated lime	1,301.3	1,318.0	1,590.2	1,313.4	1,355.0
Uses:					
Agricultural	406.5	362.3	382.7	454.1	373.4
Building	948.6	1,000.5	1,065.6	558.0	549.5
Chemical	2,151.4	2,219.9	3,561.2	4,307.8	3,810.3
Refractory	617.7	671.6	1,069.9	1,276.7	1,187.3

Demand for building lime was still low in 1945-46 as the postwar building program had not yet made much progress. Lime for agricultural use averaged below the prewar level as increased demand for liming material was concentrated on limestone rather than lime.

Lindbergh, Charles A.

Lindbergh (1902-), U.S. aviator, was born Feb. 4, 1902, in Detroit, Mich. He returned to the United States from England in 1939 to resume his work for the U.S. air

corps. Meanwhile he publicly advocated strict U.S. neutrality in World War II. In April 1941 he joined the America First committee, an organization advocating U.S. non-intervention in European affairs. Later that month he resigned his commission in the air corps after he had been rebuked by President Roosevelt for his political activities. As part of the anti-war campaign sponsored by the America First committee, Lindbergh charged that the British, the Jews and the Roosevelt administration were trying to involve the country in the war. After the Pearl Harbor incident Lindbergh urged vigorous retaliation against the Japanese. Following U.S. entrance into the war, he engaged in research for the war department in a civilian capacity and worked for aircraft and bomber plants.

Linen and Flax

The world's largest producing areas of flax fibre during the decade 1937-46 were the countries of eastern Europe, particularly the U.S.S.R. It was from this area that the linen-manufacturing countries secured their major supplies; and consequently, the cutting off of these countries from 1939 to 1945 was a severe blow, although large-scale programs of flax cultivation in previously low or non-producing areas like Northern Ireland, Australia, Egypt, South Africa, Canada and the United States partially offset the loss. Experiences during World War I had prompted Great Britain, especially, to lay plans for cultivation of flax in the event of national need, for flax was an essential in war for many products, including strong webbing, tapes, threads, cords and duck.

Approximately 5,000,000 ac. of flax were planted each year in the 1937-46 period with a production of nearly 2,000,000,000 lb. of fibre. Flax-fibre acreages throughout the world during the periods 1935-39 (prewar) and 1940-44 (during the war period) are given in the table.

Flax-fibre Acreages of the World
(in thousands of acres)

	1935-39	1940-44
World Estimate	6,397	5,260

Italy	10	15
Egypt	3	7

In addition to the countries listed, flax was cultivated during the war in Latin America and in the United States. In Latin America, Peru was the largest producer; commercial production started there in 1939. In 1942 production reached 7,900,000 lb. compared with 3,600,000 lb. for the next largest producer, Argentina. By 1945 Peru was

producing only 2,900,000 lb. and despite large-scale efforts by the government through the ministry of agriculture to encourage production by government allowances, government grading, etc., it was not expected that production would again reach the wartime levels. During the war, however, Peruvian flax was an aid to the U.S., which bought the entire crop under a series of contracts begun in 1941. In the U.S., flax was produced primarily in Oregon and Minnesota; while quantities were relatively small, it was reported in 1946 that the U.S. industry had achieved a firm commercial status and would continue to produce for the peacetime market.

Wartime Effects on Linen Fabrics.—While Irish linen remained the common standard of reference in thinking of the flax and linen industry, Northern Ireland shared top-production honours with Belgium and Czechoslovakia before the outbreak of World War II, with Poland and Russia following. In March 1939 Czechoslovakia's production was diverted entirely to Germany. In Sept. 1939, Poland was removed from the market, and Polish flax shipped to Northern Ireland for manufacture into linen fabrics disappeared. The invasion of Belgium in 1940 cut off a major source of linen materials and also of the best grade of flax.

Northern Ireland's factories assumed the burden of producing linen fabrics for the western world, but governmental controls on civilian fabrics were reported as eliminating almost all of them. The factories even resorted to manufacture of rayon fabrics to supplement their short supply of flax for civilian purposes. Among the linen fabrics used by the British government was a "blitz" cloth, used to cover damaged buildings. It was a light-weight duck coated with cement or used as woven. In all, the government appropriated half of the industry's production.

United States linen fabrics were first introduced in March 1944, when samples of a dress linen, woven entirely from U.S.-grown flax on cotton looms, were shown in a 36-in. width in vat-dyed colours. By 1946 screen-printed U.S. linen fabrics were being shown throughout the country by large department stores. The flax fibre came from Oregon and Minnesota, and the yarn was woven in Rhode Island on machinery especially imported from Belfast, Northern Ireland or built in the U.S. Accelerated methods of retting the flax and other improvements in mechanized handling of the yarns encouraged U.S. mills to believe that U.S. linen would be able to compete with the European products when they were restored to normal conditions.

In the meantime, the Irish linen industry was making extensive plans to retain its leadership in manufacture. Plans for an international promotion campaign were launched in March 1945 in Belfast, following several preliminary discussions as to the best ways of restoring the industry in the postwar period. The Irish Linen guild proposed an annual fund of £150,000 (\$600,000) in which Irish producers, their U.S. customers and flax growers would participate. The general plan was similar to one followed in 1926, although hope was expressed that the results would not be similar; producers in Belgium and Czechoslovakia reaped the benefit of the increased demand since they were able to sell at much lower prices because of their lower costs.

Labour difficulties were a continued problem to the linen mills. The relatively low wages paid and the unpleasant working conditions brought about a shortage of operatives. It was pointed out that three to seven years were required for training a spinning operative, and spinners were inclined to prefer working on rayon staple yarns because of

their greater cleanliness. The spinning of flax yarns required working barefoot in a humid room. The same fears were raised as to continuation of the U.S. linen industry since wages were still higher and operatives more difficult to please. In the U.S. it was hoped that the increased mechanization of the processing would offset the wage disadvantages.

Reports indicated that the Soviet Union, largest flax producer in the world, might emerge as a manufacturer of linens as well as an exporter of flax to linen-producing countries. There were definite indications, however, that Russian flax would continue to be shipped to linen-weaving countries, and one report stated that some flax and tow were being shipped to the U.S. Shipments of Russian flax were received in Great Britain in 1945, and it was said to be up to prewar quality.

The future of linen fabrics, both for household and garment use, was obscure. Use of rayon staple which could be made to simulate the appearance of the linen weave without its high cost but achieving new effects in colour and appearance, had made inroads on the household linen business during 1936-40; and it was expected that this trend would continue. This was especially noticeable in Northern Ireland. Disadvantages of linen garment fabrics, such as tendency to crease and limitation of colours available, were offset by new finishes such as the Tebilized crease-resistant finish, originated in Great Britain, and the use of new dyestuffs which gave satisfactory results in high fashion colours. Prevalence in the U.S. of sportswear types of fabrics was considered an added opportunity for linens.

After World War II had ended, a mission of U.S. textile men visited Germany and learned of several new methods of utilizing unretted flax. The fibre took the place of cotton and augmented the limited supply of rayon staple. After being harvested by mowing machines, the flax plant was deseeded and prepared for spinning entirely by large machines. It was blended with rayon staple and called Flockenbast. The final cost was greater than for 100% rayon or cotton fabrics. The high wet strength of the flax offset the low wet strength of the rayon, and the fabric had desirable characteristics of linen, including good absorption and quick drying properties. Two methods of treating the flax straw were used; one with alkali or caustic soda and the other the Korte process, using an alkaline treatment combined with chlorination. The more expensive chlorinating process gave a better separation of the fibres, a cleaner yarn and a softer and finer yarn, suitable for fine handkerchiefs and shirt fabrics. The fabric dyed and printed satisfactorily.

Subsidizing of Flax Production.—A world-wide subsidy program for flax production marked the years immediately before and during World War II. Need for flax by the Allies outweighed any consideration of cost, but there was also a reluctance to sow the flaxseed because of its tendency to take a great deal of the richness from the soil and because of the amount of hand manipulation required. Remembering unfortunate experiences during World War I, when war on the European continent cut off flax supplies, Great Britain, particularly, had granted subsidies in 1920-21 amounting to \$104,000 a year and again in 1921-22 for \$27,000. In April 1938 the Flax Development committee was set up by the government of Northern Ireland. Spinners, farmers, industrial research workers, mill owners and accountants in the flax-fibre and linen industry were among the ten members. The government gave \$668,000 during the first 3 years of the committee's existence with the provision that 10% of that amount would be provided by agricultural and linen trade groups interested

in the work. To provide a more secure basis of future operation than perpetual subsidy, the committee devoted its funds to research in more successful cultivation.

By early 1942 four 4-tank retteries had been constructed, and more direct means of securing the flax straw were devised. The mill owner bought the straw from the flax farmer, sometimes even collecting it from the farm. Prices were guaranteed. Just prior to 1939 flax sold at from 13 cents to 19 cents per pound. In 1939 prices were fixed by the British ministry of supply in association with the ministry of agriculture in Ireland at 14.4-23.8 cents per pound. In 1940 the range was increased to 25.2-32.4 cents per pound. By 1942 the range was 38.2-45.4 cents per pound. In 1943 and 1944, however, the price dropped to 36-43.2 cents per pound but an additional payment of \$40.35 was made to the grower for each acre harvested to the satisfaction of the ministry. Scutching mills were also given a subsidy to cover the entire cost of renovating or building the mills—one half as a grant and the other half as a loan. For 1945 the acreage bounty was lowered from \$40.35 to \$20.16 and in 1946 was discontinued entirely.

Schools for scutchers were established as early as 1940 by the ministry of agriculture. A subsidy of \$40.35 was allowed for each trainee, \$8.07 of which went to the mill owner and the balance proportioned between the instructor and the trainee. Group fire insurance, government-financed seed, manure, retting tanks, scutching mills and pulling machines were provided. This program was also followed in Scotland and England, where flax cultivation had reached a low figure of a few hundred acres in 1931, and only an experimental plot of 3 ac. at Sandringham was reported in England.

In 1939 the British government set a goal of 18,000 ac. for Scotland and England. By 1940 all production was under control of the Scottish Flax Company, Ltd., at Blairgowrie, or with the British government at the University of Reading. In 1941-42, the Flax Production scheme was adopted. Results of prewar experiments at Sandringham and the Norfolk Research station were used as a basis for setting up processing factories. The processors acted as agents of the ministry and contracted with farmers to grow the straw. Output of processed fibre became the property of the ministry. Prices were fixed and kept as near as possible to actual costs. Mechanization was financed by the government. Minimum wage rates were made effective Jan. 16, 1942, in order to encourage workers to remain in the industry.

The trend in 1945, however, was to do away with these special subsidies. In addition to the elimination of the acreage bounty in Ireland, previously mentioned, no further help was given to the Scottish industry. In England, however, the Flax Production scheme was continued, and the government guaranteed a market for an annual minimum acreage through the 1948 harvest. For the 1945-46 season, the acreage was 25,000.

In Eire, the Flax Act of 1936 guaranteed a bounty of \$49.71 an acre. No bounty was paid after 1940, because of high prices, which ranged from 18 to 25.2 cents per pound for the 1941 crop. In 1942 prices were raised and guaranteed in a range of 30.9 cents to 38 cents per pound for dam-retted flax. Prices were raised again the following year, from 35.9 cents to 43.1 cents per pound. Additional bounties were given for erection of a dam and a contribution to the new Flax Development board. In 1945 prices were 36-43.2 cents per pound. The Flax Development board was established in 1943 by the department of agri-

culture to train new workers, make grants toward the cost of erecting new scutching mills, provide turbine scutching units and construct or renovate flax dams. The 1946 contracts guaranteed 28.8–36 cents per pound for the dam-retted and hand-scutched flax and 31–38.2 cents per pound for the turbine-scutched.

Canadian flax acreage in 1937 was about 5,000 ac. Between 1936 and 1939 the government encouraged the adoption of modern milling and labour-saving machinery to reduce the cost of production and thus encourage greater acreage, particularly in Quebec, where production was concentrated. When World War II began, the Special Products board increased acreage rapidly so that by 1942 the total was 47,000. The following two years showed a decline, so that 1945 saw only 21,000 ac. in flax. Prices were set each year; a fibre flax administrator controlled an export program whereby, in Sept. 1941, 50% of the crop was ordered shipped to the United Kingdom. The remaining 50% was to be divided between the U.S. and Canada. In Aug. 1942 all flax of spinnable quality was sold to the Special Products board which then resold it, except for essential Canadian requirements, at the same price to both the British and U.S. governments on a 50–50 basis of quality. Prices in the 1942–43 crop year ranged from 33.6 cents to 40.9 cents per pound for scutched flax. During the following year, the price of top grade flax was increased to 55 cents per pound and continued at that rate through 1946. Canadian prices were less than U.S. prices but it was explained that Canadian flax was dew retted, whereas United States flax was water retted. Further aid was given through interest-free loans for the construction of scutching plants and essential machinery. In the latter case, a rebate of one-third of the price was also given if machinery was purchased between Jan. 1, 1940, and March 31, 1945. No further export contracts were made with the British following the close of the 1945–46 flax crop, and guaranteed sales and prices also terminated.

Bounty payments had been a custom in Australia from March 1, 1930, to Feb. 28, 1935, but nothing was done to encourage flax production between 1935 and 1940. The United Kingdom's importunities for increased production in wartime resulted in a guaranteed price to growers. Flax mills were constructed for processing the straw and were owned and controlled by the commonwealth government.

In Australia, mechanization of flax pulling reduced the cost of production appreciably. During the period 1940–43, inclusive, however, the maximum prices, including bonus, rose from \$19.37 a long ton (2,240 lb.) to \$32.28. The estimated average cost per acre of growing and delivering the crop to the mill was \$17.43. Total acreage planted rose from about 2,000 ac. in the 1939–40 season to about 57,000 ac. from 1942 to 1946.

New Zealand's first flax crop was planted in 1939 under a wartime agreement with the British government. Cost of production was guaranteed, and a minimum fibre price up to \$110.30 per ton of 2,240 lb. and \$15.32 per acre. Losses were met by the government as a war expense.

A grant was given British East Africa following a study made in 1938 as to flax-growing possibilities. There had been a substantial cultivation during World War I, but with dropping prices production fell to almost nothing. Wheat had taken the place of flax, and the Kenya Flax board, operating 12 processing plants in 1943, paid flax prices comparable to wheat prices. Acreage, which had been practically nil between 1920 and 1939, rose to 16,000 in 1943 but once wartime government purchases ceased,

acreage returned to wheat; no help was given after 1945.

Belgian interest in flax cultivation was so extensive before World War II that no incentives apparently had to be offered; but in the Netherlands, prior to 1940, those who grew flax on land allotted to them by the Provincial Agricultural Emergency organization were given a bounty of \$13.63 an acre under a law passed in 1934. Processors were paid \$34.09 an acre. Following World War II government authorities opened the Institute for Research in Netherlands Flax Cultivation for the purpose of continuing the program interrupted by German occupation.

In France a law passed in 1931 permitted bounty payments on stripped flax in the straw, of French origin, and retted on French territory. Total payments allotted were up to \$2,352,000 a year. A premium of 3.7 cents per pound was allowed during 1937–38 on the basis of the price of Russian flax on the exchange, unless the exchange price exceeded 12.9 cents per pound. These premiums continued throughout the war.

Because of eastern Europe's substantial lead over all other sections of the world in production of flax, the Russian program of encouraging the industry was on a much wider scale. Prior to 1941 a contract system for flax production between the government and the collective farms set prices, delivery quotas and acreage. Tax benefits were given for producing the quota, but failure to meet the quota meant only loss of income. Incentive payments were offered for exceeding quotas; the amount varied with the district. Where the quota was high, the supplementary price was a higher percentage of the regular price. For example, 50% of the contract price was given on a quota of 89–134 lb. per acre; 200% if the quota was 368 lb. an acre. In 1941 a procurement plan was adopted. Payments were made to the collective farm in rubles, and the price depended upon type and quality over a range of 32 grades of flax. In addition to cash payments, the farm received special allotments of fats and oils for each quintal (220.46 lb.) of flax. In 1945 a new decree provided bonuses to farm members as individuals, paid by the collective farm. Each member was paid outright extra grain and 1 ruble in cash for each 10 kg. (21.4 cents for each 2.5 lb.) of flax sorted, dried and delivered to the factory. An additional 2.2 lb. of grain and 18.9 cents in cash were paid for each 100 kg. (220.5 lb.) of flax delivered. Flax workers of each farm were given 40% of the farm's incentive payments for excess quantities delivered as their special share of the income. Wartime losses and destruction took 50% of prewar productive capacity, but an official five-year plan called for a crop of about 1,764,000,000 lb. of fibre in 1950.

Egypt, where flax and linen had been found in the ancient tombs, was another country that preferred wheat instead of flax as a crop. With the opening of World War II, however, the Egyptian ministry of agriculture arranged with the British government to purchase the entire 1940–41 crop at a price comparable with that of wheat and barley. This arrangement continued until the close of 1944, when wheat prices were raised without a comparable change in flax. Production declined from 30,000 ac. to 7,000 ac. the following year.

Subsequently, acreage was about equal to normal small prewar plantings.

Linlithgow, Victor Alexander John Hope

The 2nd Marquess of Linlithgow (1887–), was educated at Eton and succeeded to the marquise in 1908. After serving in the British army, he was civil lord of the admiralty from 1922 to 1924 and chairman of the Royal commission on Indian agriculture from 1926 to 1928. In 1933 he was appointed chairman of the joint select committee on Indian constitutional reform; he helped formulate and enact the Government of India bill in 1935. Linlithgow succeeded Lord Willingdon as viceroy of India in April 1936. With the outbreak of World War II in Europe, Linlithgow declared the government of India at war with Germany, an act which enraged the Indian nationalists who maintained that such an important decision should not have been made without first consulting the people. When the All-India congress called for nonco-operation in the war effort, Linlithgow countered by suspending the Indian constitution. He responded to the civil disobedience campaign of 1943 by imprisoning the leaders of the Congress party, including Gandhi. On Oct. 20, 1943, Linlithgow was succeeded as viceroy by Field Marshal Wavell.

Lin Sen

Lin Sen (1864–1943), president of China, was born at Foochow, Fukien, in 1864. He was educated by U.S. missionaries and at a private college. He lived in San Francisco for several years and while in the United States became a member of the Kuomintang, then a secret society. Returning to China shortly after the revolution of 1912, he won a seat in the senate of the first parliament—a post he held until 1923. He became a member of the central executive committee of the Kuomintang in 1924, was named to the state council of the national government in 1928, and was vice-president of the legislative Yuan, 1928–31. He succeeded to the presidency of that body in March 1931. Lin Sen became president of the national government in 1932, when a candidate was sought whose position in Kuomintang circles would qualify him to unify dissenting factions of the Nanking government and the Canton group. He successfully bridged the political gap and was revered by the Chinese people as an elder statesman. Despite his high office, he withdrew from the limelight and led a life completely devoid of ostentation. His position as president was a nominal one, for Chiang Kai-shek, who relinquished the presidency in late 1931, still controlled the real reins of government. Lin Sen died in Chungking, Aug. 1, 1943.

Liquors, Alcoholic

In Dec. 1933, 14 years of prohibition came to an end in the United States—an interregnum which had a great and decisive influence on the following decade. During prohibition, the production of all alcoholic beverages was at first stopped completely, and sales were permitted for medicinal purposes only. The existing inventories were gradually reduced and by 1928 had reached such a low level that production of limited quantities for medicinal purposes only was authorized under special government

permits. Since four years are generally considered the normal minimum time required for the maturing of most alcoholic beverages, it was not until late in 1937, or rather early in 1938, that the revival of production which began in Dec. 1933 could make itself fully felt.

Therefore, a consideration of the 1937–46 period should include to some extent the status of production and inventories existing in 1933.

The most important alcoholic liquors are whisky, gin, brandy, rum and liqueurs. Whisky is distilled from a fermented mash of grains. In U.S. whiskies, either corn or rye grain predominates. Scotch whisky is made from barley malt which has acquired during its preparation the “smoky” aroma which is its outstanding characteristic.

Gin or geneva had its origin in the Netherlands. English gin, which was at first a copy of the Dutch product but was later made under a modified method, dominated not only the British but also the general world market. London Dry Gin is by far the most popular variety. However, the production and consumption of gin in the United States in normal times is much greater than in England.

Brandy, or specifically “grape” brandy, was recognized for a long time as almost an exclusive product of France, although some other countries such as Spain, Greece and Portugal also produced brandies. In particular, the product originating from the Charente district and which alone is entitled to the designation “cognac” (named after the capital) was considered as a standard for this type of beverage. The production of brandy in the United States was almost entirely confined to the state of California. Before prohibition this product was of minor interest, but brandy as an industry of California later gained steadily in importance until the product had reached a very high quality and reputation.

Next to whisky, rum was for many years the favourite alcoholic beverage in Anglo-Saxon countries. It gradually receded in interest and consumption, however, until it followed gin and brandy in importance. It is a product derived from the distillation of juices obtained from sugar cane or cane products, such as molasses. Originally, it was produced in the West Indies, especially Jamaica, Puerto Rico and the Virgin Islands. Later the production was also taken up on the mainland in the United States, where large-quantity production was reached.

Whisky is by far the predominating alcoholic beverage in the United States. It is produced and consumed in a great many varieties. Bourbon obtained from a mash with a minimum of 51% corn (but usually 60%–80% of this grain) is the most popular. Rye whisky (with not less than 51% of rye grain in the mash) is second in importance and popularity. Other varieties are corn and malt whisky.

Kentucky was traditionally known as the producer of the finest quality of whisky. Gradually much of the production shifted to other states, and differences in quality and reputation were gradually narrowed. Approximate distribution of the product by the various states is as follows: Kentucky 53%; Illinois 17%; Indiana 12%; Pennsylvania 7%; Maryland 6%; other states 5%.

Whisky becomes taxable to the United States government as soon as it comes into existence. The necessity of storing large quantities for many years would make immediate payment economically impossible. For this reason, the United States government permits the delay of tax payment without interest for a period of eight years. This gives the distiller ample time to mature inventories, and in the meantime the distilled spirits are stored in bonded

warehouses under government supervision and cannot be removed except upon tax payment.

Whiskies are bottled either straight or blended with grain neutral spirits which are matured separately by storage in warehouses, either in new or reused barrels. The size and composition of the whisky inventory both influence bottling operations and sales.

When the 18th amendment was repealed in Dec. 1933, inventories of aging whisky were negligible because none had been produced during the 14 years of prohibition other than an inconsequential amount for medicinal purposes. Distillers therefore were faced with the problem of producing much more than current requirements in order to build up inventories for aging and future use. (Normally, whisky is not placed in consumption channels until several years after it has been produced. In large measure, the whisky consumed in 1937 was taken from stock laid away for aging in 1934.) Thus, during the first four years after repeal, the production of whisky exceeded the amount withdrawn from government-bonded warehouses for use by 65,000,000 tax gal. in 1934, 110,000,000 gal. in 1935, 152,000,000 gal. in 1936 and 61,000,000 gal. in 1937, the excess of production in those years representing amounts earmarked for aging.

Production of all distilled spirits showed similar sharp increases, rising from 131,000,000 tax gal. in 1934 to a peak of 293,000,000 tax gal. in 1936 and falling off somewhat to 218,000,000 tax gal. in 1937.

Inventories in United States government warehouses of all spirits rose from 98,000,000 tax gal. at the end of Dec. 1934 to 474,000,000 tax gal. on Dec. 31, 1937 (before computation of losses resulting from evaporation and leakage), whisky comprising approximately 95% of the total.

During this period, foreign producers of beverage spirits were establishing markets in the United States. In reflection of a desire on the part of some consumers for Scotch and Canadian whisky, rum and other foreign specialties, imports of all distilled spirits during 1937 and 1938 were double the 1934 and 1935 amounts (from 7,200,000 proof gallons in each year in 1934 and 1935 to 15,200,000 and 17,100,000 proof gallons in 1937 and 1938, respectively). Whisky imported mainly from Canada and the United Kingdom comprised from 78% to 88% of total imports in the first 4 postrepeal years. By and large, imports had never comprised a significant part of the total distilled spirits consumed in the United States, although during this early period of reconstruction they were helpful in augmenting the supplies of domestic products available for consumption.

The 21st amendment to the constitution, while retaining federal control over manufacture, sale and distribution, vested full rights in the individual states concerning manufacture, sale and distribution within their territory. Some of these states did not vote to adopt a legal sale status until some years after repeal. Thus, although consumption of both domestic and imported beverage spirits rose from 58,000,000 wine gal. in 1934 to 135,000,000 in 1937, this was largely because of the increase in the number of states which permitted the sale of alcoholic beverages (from 28 states at the end of 1934 to 43 states at the end of 1937). In 1946, 3 of the 48 states were still legally "dry"—Kansas, Mississippi and Oklahoma.

During this "reconstruction" period the federal government increased the federal excise tax on distilled spirits from the base of \$1.10 per gallon at the beginning of 1934 to \$2.00 by the end of 1937. The government collected

\$68,400,000 in direct distilled spirits taxes in 1934, \$165,600,000 in 1935, \$222,400,000 in 1936 and \$274,000,000 in 1937. In addition, customs duties, licence fees and other revenues from all alcoholic beverages brought the federal government total up to \$417,000,000, \$497,000,000, \$612,000,000 and \$633,000,000 in each of the first 4 years after repeal. Collections of state and local governments rose from \$126,000,000 in 1934 to \$339,000,000 in 1937 on all alcoholic beverages. The money received by the states and their local governments from this source represented a substantial part of their total revenues.

By the end of 1937 distillers had achieved their objective in establishing an inventory of "normal" size which would permit regularly spaced withdrawals adequate for current consumption and regular replacement of such withdrawals by current production.

In 1938, following the industry's achievement of a satisfactory inventory level, production of beverage spirits dropped to 158,000,000 tax gal., a decrease of nearly 28% from the year before. That year saw a minor business recession, and withdrawals showed a decline of 5,000,000 tax gal. from the level of 1937 in reflection of the slackening of consumption generally occurring during periods of declining national income. At the end of the fiscal year 1938, per capita consumption of all distilled spirits had fallen to 1.00 wine gallons from 1.03 wine gallons the year before.

From 1939 to 1941, U.S. national income rose steadily, and the broadening demand for distilled spirits caused an increase in production to 145,000,000 tax gal. in the latter year. The increase was largely the result of factors brought about by the imminence of U.S. entry into World War II. Early in 1941 a few distillers had voluntarily converted their facilities to the production of alcohol needed

Jacketed cooling pipes at a U.S. distillery manufacturing ethyl alcohol. By order of the War Production board, 80 U.S. plants stopped all manufacture of whisky Oct. 8, 1942, to make alcohol for war uses

for ordnance and similar uses and in increasing numbers followed suit in the months immediately before Pearl Harbor.

With the stabilization of the U.S. industry in 1937, the need for supplementary supplies from abroad had decreased, and in 1938 and 1939 imports of all distilled spirits had dropped to 12,000,000 proof gal. in each of these years. Although imports for consumption rose moderately in 1940 and 1941, this was largely because of the increasing amounts of spirits which were brought in from the Caribbean area as World War II cut off European sources of supply.

Scotch whisky shipments remained at a level of about 7,500,000 proof gal. for the 3 years from 1939 through 1941, while Canadian whisky remained at about the 2,000,000-gal. figure during that period.

Per capita consumption, as shown in Table I, increased moderately (from the 1939 level) in 1940 and 1941 to 1.02 and 1.04 wine gallons respectively, reflecting a concomitant rise in all consumer expenditures as recovery from the business recession of 1938 progressed.

Table I.—Distilled Spirits—Apparent Average Annual Per Capita Consumption in the Continental United States (tax gallons)

Fiscal Year	Domestic	Imported	Total
1934*	.30	.03	.33
1935	.67	.03	.70
1936	.73	.08	.81
1937	.90	.13	1.03
1938	.89	.11	1.00
1939	.84	.09	.93
1940	.93	.09	1.02

Source: Computed from official statistics of the U.S. Dept. of Commerce and the Bureau of Internal Revenue.

During the 4 years from 1938 through 1941, there were 3 increases in the federal excise tax rate on distilled spirits—from \$2 per gallon to \$4 per gallon, a 100% increase. During that time internal revenue collections rose from \$565,000,000 in 1938 to \$927,000,000 in 1941.

Five months after Pearl Harbor the Japanese had seized 90% of the world natural rubber-producing areas. The only way to overcome this critical loss was by production of synthetic rubber. One of the basic components of synthetic rubber is butadiene, which may be produced from alcohol.

To insure and safeguard the available sources of supply, the War Production board by mid-Feb. 1942 placed all beverage-distilling plants capable of producing high-proof (190-proof) alcohol on a war production basis. The other distillers produced beverage spirits and high wines (alcohol of 120–160 proof) for conversion into 190-proof war alcohol alternately until Oct. 8, 1942, when the WPB ordered the remainder of such producers to effect complete conversion to war alcohol production.

The year 1942 marked a new postrepeal high in distilled spirits consumption, yet production of domestic whisky and gin fell 43% below the 1941 level.

The first signs of the 1943–44 whisky shortage began to become evident.

During 1942 beverage-distilling plants accounted for more than 40% of total alcohol production. In 1943, when the German U-boat menace was at its height, disrupting the shipment of molasses from which 70%–85% of all industrial alcohol was produced in the prewar years, beverage distillers had converted and enlarged their productive facilities to such an extent as to produce 50.7% of all war alcohol output for the period. From Pearl Harbor

until V-J day, the beverage-distilling industry produced approximately 750,000,000 gal. of war alcohol, according to estimates by the WPB, approximately 50% of the grand total.

Table II.—War and U.S. Industrial Alcohol Requirements (in millions of 190-proof gallons)

	Calendar Years		Change from Previous Year		Change from Previous Year		Change from Previous Year	
	1942	1943		1944		1945		
Synthetic rubber	126.0	...	345.0	+173.8%	335.0	-	2.9%
Direct military and lend-lease. . .	71.2	102.9	+44.5%	78.6	-23.6%	89.0	+	13.2%
Indirect military and civilian . .	128.0	147.9	+15.5%	160.3	+ 8.4%	160.0
Antifreeze. . .	30.0	50.8	+69.3%	30.0	-40.9%	20.0	-	33.3%
Total. . .	229.2	427.6	+86.6%	613.9	+43.6%	604.0	-	1.6%

Source: Compiled by Licensed Beverage Industries, Inc., from data of the War Production Board.

In addition to the production of war alcohol for synthetic rubber, smokeless powder, pharmaceuticals, etc., the beverage-distilling industry continuously manufactured high-protein animal food as a by-product of the distilling process from the grain recovered from the distilling mash. During the distilling process, only the starch is removed from the grain and food values of the recovered feed are considerably increased. During 1945, 609,000 tons of these high-protein feed grains were recovered by beverage distillers for use as livestock, dairy cattle, and poultry feed.

Parenthetically, it is of interest to note that as a result of research and development of certain phases in its own field there resulted another wartime contribution of the beverage-distilling industry in the development of techniques of manufacturing penicillin and other antibiotics. Further progress was also made in the industry's research laboratories on the perfection of techniques of using the by-products of alcohol plants for the making of essential animal food ingredients, corn oil, plastics, dry ice and other chemicals useful for various industrial processes.

From Oct. 8, 1942, until July 1944 U.S. distilleries produced no whisky, gin or neutral spirits for beverage purposes, although quantities were steadily withdrawn for consumption from prewar stocks on hand. During the latter part of June 1944 the WPB announced that because current stocks of war alcohol were adequate for immediate needs, beverage distillers could produce beverage spirits during the one-month period beginning Aug. 1, 1944, the first time since complete industry conversion to war work that distillers had been granted a "furlough."

During that 1-month period, 53,825,134 tax gal. of whisky, gin and neutral spirits were produced, of which 14,100,000 comprised whisky. Output, however, was limited because of a severe drought in Kentucky and a War Food administration ban on the use of corn, a basic ingredient in the manufacture of bourbon. Consequently, no bourbon was made during that period.

In Jan. 1945 the industry was again granted a one-month furlough for beverage production. Improved water supply and limited use of corn brought production for the month to 63,591,261 tax gal. Again in July 1945, because of suspension of shipment of lend-lease alcohol to Russia, collapse of Germany and, again, favourable position of government stock piles of alcohol, registered beverage distillers were allowed to produce beverage spirits during that month.

WPB control over beverage-distilling plants was relinquished on Aug. 31, 1945, but because of the world shortage in all foods the department of agriculture continued

to restrict the amounts and types of grain to be used for beverage purposes. Although distillers were able to make 101,600,000 tax gal. of whisky in 1945 (against a 1-month production total of only 14,100,000 gal. in 1944), inventories were still much less than prewar normal level and distillers were unable to add to inventories in any important degree.

At the end of 1945 net whisky inventories were 270,000,000 gal., as compared with a prewar normal of about 425,000,000 gal. net.

Whisky withdrawals during 1945 were 5½% less than the 1944 volume, largely because of the uncertain production prospects. However, because of the availability of neutral spirits for blending purposes, distillers were able to increase the amount of total bottled whisky to 150,000,000 wine gal. from the 120,000,000-gal. level of 1944.

The impact of the war years adversely affected U.S. import relationships also, since the principal foreign whisky exporters (Great Britain and Canada) were compelled to convert plant facilities for war requirements and to curtail shipments. This was particularly true in the United Kingdom, where distillation of beverage spirits was suspended for a five-year period from 1940 through 1944. Scotch whisky, normally the largest item in distilled spirits imported into the United States, suffered a sharp decline as a direct result of cessation of production by the grain distillers in Scotland in 1939; distillation of malt whisky had stopped by the end of Feb. 1940 (see below).

Although WPB control over the beverage-distilling industry facilities was relinquished on Aug. 31, 1944, the department of agriculture, because of reported world grain shortages, made only monthly allocations of grain for beverage use which sharply restricted production—6 days during September, 7½ days each during October and November and 10 days during Dec. 1945 and Jan. 1946. Beginning in Feb. 1946, however, the allocation trend was again reversed and the department of agriculture reduced the grain allocations to the industry in successive months, finally to a three-day-a-month basis in June and July.

At the end of the war, as previously noted, inventories of aging whisky were still abnormally low and, in a broad sense, distillers found themselves in much the same position as they were at the end of prohibition. The absence of beverage production during the war had depleted inventories and dislocated aging schedules. Inasmuch as it

normally takes four years to mature whisky, if the industry were permitted to resume full-scale, regular production in 1946, it would not be until 1950 that normal inventories and supply conditions could be established.

Continuing grain shortages indicated that the same distortions in domestic supplies and importations which existed during the war years might continue for some time. With the reopening of certain other sources of supply (notably France) as a result of the end of the war, various brandies and liqueurs again appeared on the U.S. market. However, since the volume of all imported spirits generally consumed in the United States had never bulked very large, these new influences probably would not markedly add to current supplies.

The wartime disruption of the U.S. and foreign distilling industries caused a decline in per capita consumption figures from 1.13 wine gallons in 1942 to 1.11 and 1.03 gallons in 1943 and 1944, respectively.

In Nov. 1942, the excise tax rate on distilled spirits was increased to \$6 a tax gallon and again, in April 1944, the rate was increased to \$9 a gallon, 718% more than the rate in effect when prohibition ended in Dec. 1933. These unprecedentedly high rates resulted in new peak revenue collections for the federal government to \$1,200,000,000 in 1942, \$1,500,000,000 in 1943, \$2,100,000,000 in 1944 and \$2,400,000,000 in 1945. (A. J. LI.)

U.S. Liquor Control.—During the decade 1937-46 the progress of liquor control in the United States was marked by four important developments: (1) increase in revenues from alcoholic beverages by taxation; (2) enlargement of the scope and detail of control; (3) greater recognition of the social implications incident to the trade in liquor, with heightened vigour in the attempt to eliminate abuses and (4) effort, along scientific lines, to understand the causes of alcoholism and excessive drinking, and to provide for the care and cure of alcoholics. The methods of control fell into three categories: Increase in taxes and licence fees; federal, state and local control and self regulation by the industry. The abuses which led to the extension of control may be summarized as follows:

Drunkenness and excessive drinking. In 1946 there were estimated to be in the United States 50,000,000 moderate drinkers; approximately 2,000,000 excessive drinkers and about 600,000 alcoholics.

Sales to minors. This was mainly an administrative problem since such sales were forbidden in every political subdivision under local or state control.

Antisocial conditions in taverns. This involved the tavern as a place of unwholesome atmosphere, sometimes demoralizing, especially to young men and women, and a gathering spot for the outlawed and rejected of society—hoodlums, prostitutes, petty thieves, bootleggers and so forth.

There were other abuses of almost equal magnitude, among which were bootlegging, dilution, subsidization by supplier of retailer and illegal labelling.

An outstanding development which many students of the problem viewed with alarm, was the concentration of the industry, particularly marked in the case of the distillers and less so in the brewing and wine industry. Four big distillers dominated distilling, having absorbed 35 smaller concerns during the decade. Only five large independents were left, and about 100 smaller concerns were operating. Such a concentration, it was feared, might easily pose new and difficult problems of control. However, the producers showed a marked willingness to cooperate with law-enforcing authorities and also exhibited an awareness of their social responsibilities. This was also true of the large brewers and vintners.

The number of breweries decreased during the decade

from more than 1,200 to 466. In 1946, only 7 produced more than 1,000,000 bbl. annually apiece.

The distillers entered extensively into the wine field, and by 1946 controlled about 20% of the production and storage, almost entirely in California, which produced 90% of the nation's wine.

Centralization of the industry was accompanied by tremendous technological improvement and increase in facilities for production. The four largest distillers alone could produce all the distilled spirits the country could consume. By-products became highly important both in the distilling and brewing industries. The federal government in its program of grain restriction during 1945 and 1946 allowed only those plants with the necessary equipment and ability to process the by-products effectively to share in the grain allocation.

After repeal, federal excise tax rates increased as shown in Table IV.

Table IV.—U.S. Federal Tax Rates
(per gallon)

Year	Distilled Spirits*	Malt Beverages	Wine 14%–21%
1933	\$2.10	19 cents	20 cents
1934 (Jan.)	2.00	16	No change
1936	No change	No change	10 cents
1938 (July)	2.25	No change	15 "
1940 (July)*	3.00	19 cents	18 "
1941 (Oct.)	4.00	No change	30 "
1942 (Nov.)	6.00	23 cents	40 "
1944 (Apr.)	9.00	26 "	60 "
1945	No change	No change	No change
1946	No change	No change	No change

*From July 1940 to Oct. 1941 brandy was \$2.75, not \$3.00. Otherwise rates are the same.

State taxes did not show a similar increase. In 1946 they ranged from 50 cents a gallon in the District of Columbia to \$2.72 in South Carolina. The average was about \$1. The rate in 1946 was \$1.50 in New York, \$1.28 in Texas, \$1 in Illinois, 80 cents in California and \$2.08 in Indiana.

Licence fees showed great variation, with the trend steadily upward in amount. There were local licence fees, state licence fees, sometimes one or the other and frequently both.

Federal revenues represented five-sixths of the total, the state revenues almost one-sixth. Local revenues were less than 10% of state revenues. In estimating the state revenues, sales taxes, levied in some states on all articles sold to the public, were not included.

In addition to these revenues there were import duties. In time of domestic shortages, as in 1943 and 1944, these approached the \$100,000,000 mark.

The enormous increase in taxes is shown in Table V. It was, of course, absorbed in its entirety by the consuming public. In a number of states liquor taxes were allocated

Table V.—Federal, State and Local Government Revenues from Alcoholic Beverages
(Calendar Year 1934 Through First Quarter 1946)

Calendar Year	State and Local Government	Total Federal*	Grand Total Federal, State and Local
1934	\$ 125,795,703†	\$ 416,566,163	\$ 542,361,866
1935	177,311,209†	496,937,877	674,249,086

to particular purposes, such as road building, care of state institutions, etc. Federal liquor taxes were not allocated to specific purposes. A movement sprang up to allocate a portion of the tax revenue to the establishment of clinical facilities for alcoholics, to study and research.

Establishment of the Office of Price Administration in 1941 was the most important single piece of control legislation, federal, state or local, since repeal. It was a boon, financially to the industry. OPA set ceiling prices upon all alcoholic beverages; in some cases this was a flat price; in others it was based upon percentage mark-ups; the latter system was much the more commonly used. Roughly there was flat pricing for the distillers, based upon the age of the whisky and the proof; the distributors' mark-up over cost was 15% and the retailers' mark-up 33½%, with variations in the case of cordials, wine and beer.

The fixed margins of profit given the distributors and retailers were greatly in excess of those of peacetime. Between 1942 and 1946, the economic position of the distributor, as well as that of the distiller, was strengthened to a remarkable degree. The retailers likewise enjoyed great prosperity as evidenced by a large increase in the number of retail licencees, for both taverns and package stores.

The individual states took little part in OPA. They left it to the federal agency to dictate the policy, lay down the rules and take charge of the administration.

While OPA stabilized the entire industry, it also gave rise to a tremendous black market, which flourished in spite of vigorous governmental attempts to curb it. Instead of illicit stills, bathtub gin, bootleg liquor either fraudulently labelled or not at all, violations consisted of payments of more than ceiling prices. This was generally in cash, under the counter, not reported in income tax returns.

The trend during the decade 1937–46 was away from local and toward state control. This was continuous, but not rapid, with many exceptions and reversals. Cities as a rule considered local control of liquor a part of their home-rule program and were loath to give up power to a centralized authority. Most students agree that state governing bodies are less subject to political pressure than are local authorities; hence, enforcement is stricter and more equitable. On the other hand, the local authority has a substantial police force, frequently greater in number than the agents of the state authority; the same holds true in unincorporated areas where the sheriff and his deputies are the chief enforcing authorities. Co-operation between the different bodies was often half-hearted and casual.

The tendency toward centralization of control authority in the state was exemplified by the laws of California and New York, generally credited as being the best systems. In New York the state issued all liquor licences, including retail. The local political unity could make recommendations, but the final decision rested with the state body. Retail licences for sale by the drink were issued only for premises where meals were regularly served by the licensee. This tieup of the sale of liquor by the drink with the restaurant business worked well. In California the state authority had sweeping powers. The result was a more satisfactory control system.

In most of the states the authority was divided during the decade between state and local bodies, as in Illinois. In Wisconsin, with some exceptions, the local authority issued the licences.

Division of control had many objections. Each body was jealous of the other. Instead of supplementing they tended to neutralize each other.

A great residue of sentiment against the sale of liquor remained after repeal. In one group were the drys who thought repeal was a disaster and who directed their efforts toward the drying up of specific areas. In another were those who believed the sale of liquor should not involve private profit. Three states—Mississippi, Kansas and Oklahoma—decided to remain dry except for beer. Liquor was, however, sold in those three states through the working of the Federal Liquor Dealers Tax Stamp system.

Following were the principal methods by which, during the ten years 1937-46, the individual states attempted to control the distribution and sale of liquor.

Monopoly System.—Seventeen states between 1933 and 1938 adopted the so-called monopoly system and still retained it in 1946. They were: Alabama, Idaho, Iowa, Maine, Michigan, Montana, New Hampshire, North Carolina, Ohio, Oregon, Pennsylvania, Utah, Vermont, Virginia, Washington, West Virginia and Wyoming. Although bills for the adoption of this system were introduced in practically every one of the licence states during the decade 1937-46, no state adopted it during that period.

The monopoly system had many variations. In nine states—Alabama, Idaho, Iowa, North Carolina, Oklahoma, Utah, Virginia, Washington and West Virginia—on-premise sale by the drink was forbidden. In all of them except one the sale of liquor by the package or bottle was carried on solely in state stores or agencies. In some, state stores and private licencees existed side by side. Thus Michigan, a monopoly state, operated its own liquor stores and had agencies; in addition it issued licences to retail outlets selling beer and to still others selling beer and wine. Only in rare cases did the monopoly system extend to beer and wine. In Oregon the monopoly was for wholesaling only. In most of the states, warehouses for storage were owned by the states which were the only wholesalers; where dual systems existed, both the state stores and the private licencees bought only from the state wholesale agency. Other variations existed. Ohio, for example, issued permits allowing unlicensed persons to buy supplies from without the state.

In all cases the system proved enormously profitable. Its advocates claimed that state store ownership eliminated sales to minors and greatly reduced drunkenness. State control, it was argued, had given the retail liquor business a respectability which it lacked elsewhere.

Against the system, it was argued that the state authority devoted its attention to profit rather than control, to the neglect of the latter; the state stores provided a pool of employees who might quickly be involved in the political machinery and become party workers for the party in power. The jobs might become political plums and increase the patronage by which the "ins" could entrench themselves. In answer, the proponents said civil service obviated the situation complained of. The most frequent argument, however, was that the monopoly system was an infringement upon free enterprise and represented an encroachment by the state into a field as alien to it as the grocery or drugstore business. It was also claimed that under the licence system more labour was employed and more money earned, the circulation of which did the state more good than the revenue derived from state stores.

Local Option.—Local option is the system by which a political subdivision can forbid the sale of alcoholic liquor

One of the distilleries which operated seven full days per week to supply an annual average of 250,000,000 gallons of ethyl alcohol used during World War II for smokeless gunpowder, synthetic rubber, antifreeze for military vehicles and other war materials

or particular kinds of alcoholic liquor (beer is often excepted; beer and wine less frequently so; packaged liquor in many instances) within its own boundaries. All of the states, except Arizona, California, Indiana, Iowa, Idaho, Kansas, Nevada, North Dakota, Oklahoma, South Carolina, Utah and Wyoming, allowed some form of local option election in 1946. Twelve other states either would not permit a vote on beer, or exempted it from vote, up to a certain percentage of alcoholic content.

As of July 1, 1946, out of 18,391 elections since repeal, the drys had won in 11,243, about 61%. In the decade 1937-46, and particularly in the last five years of that period, the pace slowed down, although after the end of World War II it showed signs of acceleration.

Between 1940 and 1946, out of 7,591 elections, the drys won 4,293, about 58%. The average number of contests per year was about 1,250. During the 6 years ending with 1939, out of 10,800 contests, they won 6,950 or 64%. The average number of contests per year was 1,800. The movement had its greatest force in the years immediately following repeal. About 18% of the entire population of the United States lived in dry areas in 1946.

Local option had little success in the large cities. In Chicago, out of more than 3,000 precincts, 128 were dry in 1946. Gains were chiefly in the south and in rural areas. In 1945 Nebraska rejected prohibition in a state-wide election. In Kentucky, where one-half of the nation's whisky was made and stored, 80% of the counties were dry.

The argument against local option was that the automobile had made it easy for the drinker to buy outside the limits of the local option area. It was also argued that it stimulated bootlegging. On the other hand, when an election had been won by the dry side with a substantial

majority, so that the system had the weight of preponderant public opinion behind it, drunkenness and other attendant evils showed a perceptible tendency to decline.

Greater Care in Licensing.—Much of the abuse at the retail level was the result of the lack of discrimination in the issuance of licences. The ten-year trend was to give the licensing body more discretion in the granting and denial of licences. Investigation before licence issuance became more detailed and thorough. In spite of this the infiltration of undesirable elements who later did much to augment the problems of enforcement was not prevented. The applicant for licence was not always the actual operator, a fact not discovered until after the issuance of the licence.

On- and Off-Premise Sales.—A distinction made shortly after repeal and prevailing in a majority of states in 1946 was that between licences permitting the on-premise sale of liquor by the drink and the off-premise sale of packaged liquor. Under this system a tavern could not sell by the bottle, nor could a package store sell by the drink. The contention was that this classification simplified control. The brewers had long advocated a low-fee licence which would permit off-premise sale by the bottle in groceries, delicatessens, parking stations and other retail outlets. Many states were cold to this proposal. In the ten years 1937–46 the tendency was toward refinement of classification, with differences in fees but without enlargement of the total number of licencees. In five of the licensed states—Arkansas, Georgia, South Carolina, Tennessee and Texas—on-premise sales by the drink were not allowed.

Licence Limitation.—Legal limitation of the number of retail licences in a political subdivision gained in popularity as a control device during the decade. Often this was by fixed number; more frequently it was based on proportion to population, such as 1 to 1,000. Some cities placed minimum limits in linear feet between taverns. Most communities kept taverns out of residential districts. In some cities, the municipality was divided into zones, with different limitations in the various zones.

It was contended that lessening the number of licensed establishments increased the value of the licence; the holder became unwilling to jeopardize it by any action which would violate the law or result in unfavourable public reaction. Its advocates claimed that it promoted sobriety.

Opponents argued that it amounted to a subsidy to those already in business and was an unfair bar to newcomers desiring to enter the field. Where there was vigorous competition, in the absence of limitation, the financially weak operator might be driven to antisocial practices in an effort to stay in business. A practical difficulty was reduction in number after limitation was established. If a man died, his widow generally wished to carry on; insolvencies were extremely rare; revocations were infrequent.

State Fair Trade Practice Systems.—Fair trade practice systems gained greatly in popular acceptance during the ten-year period 1937–46. This was a plan to prevent discrimination, as to prices, discount and services, among the units at each of the different levels of the industry. Prices and other relevant information were required to be posted each month with the control authority, a copy displayed on the premises of the individual or firm and the price lists made available to all. Penalties were imposed for selling at other than the posted prices. Most of the systems provided that the price of every item sold or offered for sale should be posted.

In its most effective form, the system applied to the pro-

ducer (to post his prices to the distributor), the distributor (to post prices to the retailer) and the retailer (to post his prices to the consumer).

After the beginning of World War II there was little price competition. Most observers agreed, however, that the period of stiff competition would again set in. When and if this happened, fair trade practice systems would be extremely valuable in avoiding price wars and ruinous competition, both inimical to moderation.

Some producers developed fair trade practice systems of their own, legal under state statutes; in their contracts with their retailer customers, minimum prices were named at which the producers' merchandise could be sold.

Labelling.—A comprehensive system of federal labelling of all alcoholic beverages was developed during the decade 1937–46. Many states adopted the federal regulations *in toto*, and some added supplementary regulations of their own. Still others departed from the federal rules as well as making additions. This resulted in a great deal of confusion, because of the rapid and easy movement of alcoholic merchandise from one state to another.

Uniformity of labelling among the various states, although it found many advocates, did not make much headway. Special situations existed in particular states; it was difficult for the federal government to take cognizance of these in adopting a general code.

Trade Barriers.—Ports of entry, preferential fees and taxes favouring industries within the states and other trade barriers diminished greatly during the ten years. Those remaining were weakening under the barrage of argument against them.

By the 21st amendment to the federal constitution, states were given exclusive jurisdiction over matters involving alcoholic beverages within their own borders. The meaning of this was the subject of numerous and often conflicting decisions by the courts. The significance of the phrase "the police power of the states" was herein involved. During the decade 1937–46 the federal authority steadily extended its scope, until it seemed firmly established that federal control extended over liquor in interstate commerce. Its authority in intrastate matters constituted highly controversial ground.

The Federal Tax unit, successor to the Federal Alcohol administration, both under the secretary of the treasury, department of internal revenue, laid down nation-wide rules for labelling, advertising, signs, subsidization and so on. Many states passed their own laws covering the same fields. These were by no means always identical.

During World War II little opposition manifested itself to the extension of federal control, but the volume of protest grew greatly in the postwar period. However, the states did not meet what many of them considered the threat of federal control, in defiance of the 21st amendment, in any organized fashion. Where the states did not specifically pass statutes and the control bodies did not pass regulations, the federal rules applied.

In the fields of licensing and policing, state and local autonomy were preserved. A large factor in determining the future direction of control would be the efficiency, or lack of it, with which the states were able to regulate abuses in the industry itself. It was proposed that the federal government issue licences. Under OPA, while individual licences were not issued, the enabling act by its terms constituted a federal licensing system covering all persons in the liquor field.

The government issued basic permits to all distributors

which in effect were licences. It also issued, purely as a revenue measure, retail and wholesale liquor occupational tax stamps. These stated clearly that they were not licences, but in practice they were used as such by persons unwilling or unable to secure local or state licences. This grew to be a real evil, especially flagrant in the three dry (except for beer) states. The number of these stamps sold far exceeded the number of licences issued.

Charles J. Fleck, chairman of the Illinois Liquor Control commission, led a movement to change the law so as to forbid the issuance of these stamps to persons not possessing local and state permits or licences.

No discussion of liquor control would be complete without mention of self control by the industry, begun shortly after repeal and developed by organizations in all branches of the liquor business during the decade 1937-46.

In the so-called Nebraska plan, the brewers set up a threefold system. First was an attempt at persuasion to bring the antisocial tavern keeper into line. The brewers employed field representatives for that purpose; if this did not work, complaint was made to the law-enforcing authorities; if this did not bring the desired results, supplies were to be cut off. In practice the third and final step was never taken. The difficulty was that the retailer would always find someone, or so it was feared, who would sell to him.

Each state and each locality had its own tavern and package-store organization; there were also national associations. These organizations, whose members constituted the great law-abiding majority, lost no opportunity to proclaim their devotion to the principles of moderation and law enforcement.

The wholesalers had similar organizations. Allied Liquor enterprises did excellent work, both in the matter of education and the promotion of law enforcement. The Conference of Alcoholic Beverage Industries, composed of almost all the leading distillers, ran numerous advertisements in the general and liquor press urging no sale to minors, obedience to rule on closing hours, doing away with antisocial conditions and participation in community activities. The Distilled Spirits institute, also an organization of distillers, represented the industry at Washington, D.C., and published factual matter of great interest and value. During 1946 Allied Liquor enterprises and C.A.B.I. combined into a new organization, Licensed Beverage Industries, Inc.

The brewers and beer distributors in some instances showed great awareness of the social implications of their business by adopting a policy of shutting off sales of merchandise to taverns about which complaints had been received and verified. This probably was the most hopeful tendency in liquor control during the decade.

The prevalent thinking of the decade in the United States was that the sale of alcoholic beverages should not be prohibited unless it was found impossible to control their sale effectively. All efforts at self regulation had the necessity for effective control clearly in mind. The low position of the tavern business in the social scale was involved; the attempt was made to improve this position and offset the disapproval of a large and vociferous group by increasing the tavern's respectability.

If public opinion within the industry could be mobilized so as to make it difficult or impossible for the anti-social operator to get merchandise, many students of control were optimistic as to the resultant rise in public esteem.

New concepts of alcoholism, slowly developing during

the decade 1937-46, affected both the philosophy and methodology of liquor control. State authorities became generally aware of the alcoholic as a sick man; this recognition was largely the result of the educational influence of physicians and psychiatrists, who were mainly instrumental in the establishment of clinics in major U.S. cities, conducted under medical auspices. New Jersey appropriated \$500,000 in 1945 for the creation of institutional facilities and for research. The movement to devote a fraction of states' revenue from taxation of alcoholic beverages to the cure and care of the alcoholic was well under way.

Among important developments were establishment of the Yale school for the study of alcoholism. This school had a tremendous influence upon the habits of thinking of church and similar groups. It had been customary to approach the problem from an emotional standpoint, reflected to a large measure in the textbooks used in the public schools. The Yale lectures, published in a volume entitled *Alcohol, Science and Society*, substituted the approach of reason and impartial scientific analysis for the partisan approach previously in vogue.

Two principal schools of thought concerned themselves with the matter of method of treatment for the alcoholic. Alcoholics Anonymous emphasized the religious motif. The members of this organization sought to effect cures by association with alcoholics, who did not resent their injunctions because the members themselves were reformed alcoholics. Alcoholics Anonymous emphasized reliance on the divine, self-surrender on the basis of faith and trust.

The therapeutic school, on the other hand, divorced the cure from religious association. It combined medical treatment, including long periods of rest, sometimes shock treatment, with an effort to discover and remove the causes of the psychosis. (M. L.B.)

Great Britain, Commonwealth and Europe.—The earlier part of the decade 1937-46 was in the main uneventful in relation to the alcoholic liquors which were so commonplace a feature of everyday life. One or two interesting features were worthy of note; viz., in the United Kingdom the consumption of spirits per head of the population in the years 1937-46 was only one-quarter of what it used to be 4 decades earlier: it fell from 0.87 gal. in 1908-09 to 0.22 in 1938-39. The corresponding figures for the consumption of wines varied in a different manner and might almost be regarded as an index of national prosperity; in the year ending March 31, 1927, 18,720,581 gal. were consumed, in the year ending March 31, 1933, 12,583,153 and in the year ending March 31, 1937, 16,337,783.

With the coming of 1940, as was to be expected, vast changes occurred. Moselles and hocks disappeared from the markets. As shipping, railway and road transport were required for the movement of troops, munitions of war and vital goods, wines and spirits were not carried to their usual markets. Scottish distilleries were not allowed to have grain, and production of whisky ceased. As European countries were overrun by the Germans, they too were unable to continue to supply their types of liquors. But Spain and the south of France still harvested grapes and recorded vintages; their wines, however, did not become available to their former consumers.

It was then that one heard of "hooch"—drink containing methyl alcohol—and of the casualties ensuing from its abuse. After the liberation of North Africa, prominence was given to the fact that Algeria could produce good wine, a fact which had been assiduously suppressed by vested interests in the vineyards of France; this Algerian wine was quietly disposed of by running it through patent stills to produce plain spirit or industrial alcohol. It was

about this time, too, that many people could not obtain cognac for invalid relatives; but a few of the more fortunate were able to acquire a small quantity of South African or Australian brandy and realized that the vinous distillates from the commonwealth were not to be despised.

The connoisseur's palate could not generally attain that satisfaction to which it was accustomed in prewar days since imports and exports were controlled in a manner that ignored the niceties of vintage variations; sherry was sherry without qualification, and it was "pipe-lined" to its destination with no regard to subtle variants; the same treatment was accorded to other wines.

For hock and moselle vintages, 1937 was the best year since 1934; but the yield was small and by 1946 nothing was known of 1940 to 1945 vintages. In 1938, 1943, 1944 and 1945, claret was of good quality though the yields were small. Burgundy was at its best in 1937, 1940, 1943, 1944, 1945, but only in 1940 was the quantity abundant; 1945 was a *grand vin* year for champagne, and in 1937 there was a moderate yield of good wines; but neither could surpass the 1934 vintage. Port vintages were at their best in 1935, 1938, 1940 and 1942 with small yields. Quantities of sherry produced were also generally small; but qualities were notably good in 1937, 1938 and especially in 1945. The three best years for brandy were 1937, 1943 and 1945 though the last year was a rather short one; the record year 1875 still remained unsurpassed, and there still existed specimens of some of the brandy vintages of 1878, 1884, 1899, 1906, 1911, 1914, 1919, 1922, 1926 and 1928, but they were not ordinarily obtainable.

South Africa and Australia continued to progress as wine-producing regions, thanks in no small measure to "imperial preference" duties in the United Kingdom. The quality of their wines and spirits steadily improved, and the demand for them was notably increasing; an important factor in this development was a consistently high standard of vintage; climatic conditions are less erratic than those obtained in various European continental regions. Lisbon

The capital of Portugal covers an area of c 22.6 sq.mi. The resident population was 594,390 in 1930, and 709,179 in 1940. This increase rendered necessary the promotion of developments by both the government and by the municipality. The number of blocks of flats and buildings was 43,630 in 1940; of these, 2,630 privately-owned blocks of flats were built during the decade. The housing shortage was being felt in Lisbon as in all large cities, and the influx of population from outside as well as the increase in the resident population brought about the emergence of improvised dwellings and slums on the outskirts of the town. The state for some years had been undertaking the construction of many residential quarters for the poorest classes and of temporary houses to replace these slums and provide housing in good healthful conditions. In the residential quarters, 2,540 structures had been built up to 1942, while of the temporary houses 1,500 had been put up. Lisbon municipality in 1946 had under urban develop-

ment in the northern part of the city an area of about 495 ac. allowing for the accommodation of 50,000 persons in 15,000 comfortable, hygienic and inexpensive dwellings. They were not to be houses for the poorest classes, but low-rented houses for the middle classes. Side by side with this social work, Lisbon had been provided in the years 1928-46 with fine large buildings for housing the public services, for improving communications and for sporting events. Schools, buildings for post and telegraph offices, the mint, the national institute of statistics, the higher technical institute, the River station, may be mentioned, as also the national stadium with seating accommodation for 60,000. Reference should also be made to the restoration of structures of a monumental character such as the national museum of ancient art, the national assembly (palace of S. Bento), and the castle of St. George, the city's historic fortress.

Hospitals received careful attention from the government, many improvements having been introduced into those already existing, and new ones having been built, among them the medical faculty hospital for 1,500 beds, nearing completion in 1946, the cancer hospital, the school of nursing, etc. In 1926, the number of cases treated in Lisbon's hospitals was 40,487; in 1943 this figure had risen to 141,179.

Another task completed in Lisbon in the decade was the park of the Serra de Monsanto, a hill rising to the east of the city and connected to the centre of Lisbon by a bridge across the valley of Alcantara. The area planted and sown already covered over 2,000 ac. Work was also under way in 1946 for the new park in the centre of the city—the Edward VII of England park—which was planned to have an area of about 95 ac. Part of it was already a fine garden which included the famous *Estufa Fria* (cool green-house). Also notable were the improvements to the water supply, the sewage system, the markets, and a number of important urban developments which had been completed or were in the course of completion in the Portuguese capital: Empire square facing the church of Jeronimos, the 28 de Maio park (formerly the *Campo Grande*) and the immediate neighbourhood of the palace of S. Bento. (P. C. Ms.)

List, Siegmund W. W.

List (1880–), German army officer, was born in Oberkirchberg, Bavaria. He attended the military academy in Munich, graduating in 1898, and was commissioned a lieutenant in the Bavarian army in 1900. During World War I he was a captain on the Bavarian general staff. In 1930 he was made commander of the infantry school at Dresden, and in 1934 Adolf Hitler appointed him commander of the 4th army district of Dresden. After the Austrian *anschluss* in 1938, he was put in charge of the Austrian army. He was the general in command of the armies of occupation of Czechoslovakia in Oct. 1938, and was named governor of Moravia in 1939. He played an important part in the conquest of Poland in Sept. 1939 and was made a field marshal by Hitler after the campaign in France, during which he was commander of the 12th army. Marshal List was in command of German armies on the Moscow front during the Russo-German campaign of 1941. In early battles his forces pressed beyond Mzhaisk in the drive on the soviet capital, but powerful Russian counterdrives compelled him to retreat in the winter of 1941. In Sept. 1942 List succeeded Von Bock as commander of German armies in the central sector. In May 1945, List was captured by U.S. 7th army troops.

Literary Prizes

Some of the more important literary awards made during the decade 1937-46 were as follows:

United States

1937.—ACADEMY OF AMERICAN POETS (\$5,000): Edwin Markham. AMERICAN HISTORICAL ASSOCIATION. GEORGE LOUIS BEER PRIZE (\$240): Charles Wesley Porter, *The Career of Theophile Declasse*. JEAN JULES JUSSERAND MEDAL: Samuel E. Morison, *Tercentennial History of Harvard*. JUSTIN WINSOR PRIZE: Carl Bridenbaugh, *Cities in the Wilderness*. COMMONWEALTH CLUB OF CALIFORNIA awards to California authors. Gold medals: John Steinbeck, *In Dubious Battle* and Herbert E. Bolton, *Rim of Christendom*. Silver medals: Hartley B. Alexander, *God and Man's Destiny*, Julia C. Altrochi, *Snow-covered Wagons*, and George Ripley Stewart, *Ordeal by Hunger*. JULIA ELLSWORTH FORD CONTEST for *Children's Literature*. First prize (\$2,000): Benson Wheeler and Claire Lee Purdy, *My Brother was Mozart*. Second prize (\$1,000): James Hull, *Stage-struck Seal*. GUGGENHEIM FELLOWSHIPS: Dorothy Bethurum, Louise Bogan, Sterling A. Brown, Harold L. Cook, Donald Culross Peattie, Frederic Prokosch, Sonia Raiziss, Jesse Hilton Stuart. HARPER PRIZE NOVEL: Frederic Prokosch, *Seven Who Fled*. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS (\$1,000 in addition to royalties and advances): Dorothy Baker and David Cornel De Jong. LITTLE, BROWN & CO. CENTENARY PRIZE: Odell Shepard, *Pedlar's Progress*. LITTLE, BROWN & CO. NOVELETTE PRIZE (\$2,500): Wallace Stegner, *Remembering Laughter*, MEGRUE PRIZE (\$500, Dramatists' Guild, New York): Arthur Kober, *Having Wonderful Time*. NATIONAL BOOK AWARDS FOR 1936 (American Booksellers Association): Margaret Mitchell, *Gone with the Wind*; Victor G. Heiser, *An American Doctor's Odyssey*; Van Wyck Brooks, *The Flowering of New England*; Della T. Lutes, *The Country Kitchen*; Norah Loftis, *I met a Gypsy*. NATIONAL INSTITUTE OF ARTS AND LETTERS. Gold medal: Charles McLean Andrews. NEW ENGLAND POETRY SOCIETY PRIZE: John Hall Wheelock, *Poems, 1911-36*. JOHN NEWBERY MEDAL (most distinguished children's book): Ruth Sawyer, *Roller Skates*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), Stephen Vincent Benet, *The Devil and Daniel Webster*; second prize (\$200), Ellick Moll, *To Those who Wait*; third prize (\$100), Robert M. Coates, *The Fury*. POETRY (magazine) PRIZES: W. H. Auden, Louise Bogan, Thomas H. Ferril, Franklin Folsom, William Pillin, Roger Roughton, Stephen Stepanchev. PULITZER PRIZES (\$1,000 in each class): novel, Margaret Mitchell, *Gone with the Wind*; play, Moss Hart and George S. Kaufman, *You Can't Take it with You*; history, Van Wyck Brooks, *The Flowering of New England*; biography, Allan Nevins, *Hamilton Fish*; poetry, Robert Frost, *A Further Range*. THEODORE ROOSEVELT MEMORIAL AWARD (\$2,500, Doubleday, Doran): Dean Alfange, *The Supreme Court and the National Will*. EDWIN WOLF NOVEL PRIZE (\$2,500, Jewish Publication Society of America): Beatrice Bisno, *Tomorrow's Bread*.

1938.—JOHN ANISFIELD PRIZE (\$1,000): Elin L. Anderson, *We Americans*. BOHNENBERGER MEMORIAL AWARD (Florida Library Association): Margaret Mitchell, *Gone with the Wind*. DODD, MEAD, AND REDBOOK (\$10,000): Elizabeth Seifert, *Young Doctor Galahad*. JULIA ELLSWORTH FORD FOUNDATION CHILDREN'S BOOK CONTEST (\$3,000): Phyllis Crawford, *Hello, the Boat*. GUGGENHEIM FELLOWSHIPS: Arthur Arent, Josef Berger, Richard Palmer Blackmer, Oscar Brynes, Mrs. Mary Colum, August William Derleth, Clifford Shirley Dowdey, Jr., Joseph Leon Edel, Rolfe Humphries, William Alexander Jackson, Carlyle Ferren MacIntyre, Lewis Mumford, Katherine Anne Porter, Allen Walker Read, Frederick Millet Salter. HARPER'S MAGAZINE CONTEST ON *The American Way* (\$1,000): David Cushman Coyle, *The American Way*. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS (\$1,000 in addition to royalties and advances): Maurine Whipple. LIMITED EDITIONS CLUB GOLD MEDAL: Van Wyck Brooks, *The Flowering of New England*. LOUBAT PRIZES (Columbia University): First Prize (\$1,000): Samuel Eliot Morison, *Tercentennial History of Harvard*. Second prize (\$400): Samuel Kirkland Lothrop, *Cocle: an Archaeological Study of Central Panama*. NATIONAL BOOK AWARDS FOR 1937 (American Booksellers Association): A. J. Cronin, *The Citadel*; Eve Curie, *Madame Curie*; Lawrence Watkin, *On Borrowed Time*; Carl Crow, *400,000,000 Customers*. JOHN NEWBERY MEDAL (most

distinguished children's book, American Library Association): Kate Seredy, *The White Stag*. CARDINAL NEWMAN AWARD (Newman Foundation): Thomas Mann. NEW YORK HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL CONTEST (\$250 each): J. R. R. Tolkien, *The Hobbit*; John R. Tunis, *Iron Duke*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), Albert Maltz, *The Happiest Man on Earth*; second prize (\$200), Richard Wright, *Fire and Cloud*; third prize (\$100), John Steinbeck, *The Promise*. POETRY (magazine) PRIZES: Anne Channing, Hilda Doolittle, H. H. Lewis, Willard Mass, D. S. Savage, Dylan Thomas, Belle Turnbull. PULITZER PRIZES (\$1,000 in each class): fiction, John P. Marquand, *The Late George Apley*; drama, Thornton Wilder, *Our Town*; history, Paul A. Buck, *The Road to Reunion*; biography, Odell Shepard, *Pedlar's Progress*, and Marquis James, *The Border Captain*, and *Portrait of a President*; poetry, Marya Zaturenska, *Cold Morning Sky*. SHELLEY MEMORIAL AWARD (Poetry Society of America): Lincoln Fittell. STORY MAGAZINE CONTEST for men and women on the Federal Writers Project (\$500): Richard Wright, *Uncle Tom's Children*. WILLIAMS AND WILKINS' SCIENCE CONTEST (\$1,000): Margaret Shea Gilbert, *Biography of the Unborn*. YALE SERIES OF YOUNGER POETS: Joy Davidman, *Letter to a Comrade*.

1939.—ALL-NATIONS PRIZE NOVEL COMPETITION, AMERICAN SECTION (\$1,000): John Selby, *Sam*. ATLANTIC NON-FICTION PRIZE (\$5,000): Agnes Keith, *Land Below the Wind*. COMMONWEALTH CLUB OF CALIFORNIA AWARDS TO CALIFORNIA AUTHORS, Gold medals: George R. Stewart, *East of the Giants* and Herbert Ingram Priestley, *France Overseas*. Silver medals: Oscar Lewis, *Big Four*, Edward Alexander Powell, *Gone Are the Days*, and Dana Lamb (joint author with June Cleveland), *Enchanted Vagabonds*. DUKE UNIVERSITY PRESS PRIZE (\$1,500): Clement Eaton, *Freedom of Thought in the Old South*. JULIA ELLSWORTH FORD FOUNDATION CHILDREN'S BOOK CONTEST (\$2,000): Elinore Blaisdell, *Falcon*, *Fly Back*. FRIENDS OF AMERICAN WRITERS' PRIZE TO A MIDWESTERN AUTHOR (\$1,000): Herbert Krause, *Wind Without Rain*. GUGGENHEIM FELLOWSHIPS (c. \$2,500 each): Oscar Fritiof Ander, Herschel Brickell, Oscar Brynes, William S. Clark, Robert Donaldson Darrell, John Dos Passos, Elmer Ellis, Kenneth Fearing, Wallace K. Ferguson, Ernest C. Mossner, Herbert J. Muller, Charles John Olson, Gaines Post, Fannie Elizabeth Ratchford, Harold A. Sinclair, Robert Penn Warren, Arthur M. Wilson, Edmund Wilson, Howard Wolf, Richard Wright, Carl Zigrosser. HARPER NOVEL PRIZE (\$7,500): Vardis Fisher, *Children of God*. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS (\$1,000 in addition to royalties and advances): Mary King, Helen Todd. NATIONAL BOOK AWARDS FOR 1938 (American Booksellers Association): David Fairchild, *The World Was My Garden*; Margaret Halsey, *With Malice Toward Some*; Daphne du Maurier, *Rebecca*; Anne Morrow Lindbergh, *Listen! the Wind*. JOHN NEWBERY MEDAL (most distinguished children's book, American Library Association): Elizabeth Enright, *Thimble Summer*. NEW YORK HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL CONTEST (\$250 each): Alice M. Coats, *The Story of Horace*, and Phil Stong, *The Hired Man's Elephant*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), William Faulkner, *Barn Burning*; second prize (\$200), James Still, *Bat Flight*; third prize (\$100), David Cornel De Jong, *Calves*. POETRY (magazine) PRIZES (\$100 each): Maxwell Bodenheim, John Malcolm Brinnin, Malcolm Cowley, E. E. Cummings, H. B. Mallalieu, Stephen Spender. PULITZER PRIZES (\$1,000 in each class): fiction, Marjorie Kinnan Rawlings, *The Yearling*; drama, Robert Sherwood, *Abe Lincoln in Illinois*; history, Frank Luther Mott, *A History of American Magazines*; biography, Carl Van Doren, *Benjamin Franklin*; poetry, John Gould Fletcher, *Collected Poems*. MARY ROBERTS RINEHART MYSTERY NOVEL PRIZE CONTEST (\$1,000): Clarissa Fairchild Cushman, *I Wanted to Murder*. JAMES TERRY WHITE MEDAL (American Library Association): Louis Round Wilson, *A Geography of Reading*. JOHN ANISFIELD AWARD (\$1,000): Charles S. Johnson, *The Negro College Graduate*. DODD, MEAD DETECTIVE STORY (\$10,000): Hugh Pentecost, *Cancelled in Red*. HOPWOOD PRIZES (University of Michigan): poetry, John Anthony Ciardi, *Homeward to America*; fiction, Iola Fuller, *The Loon Feather*. SOUTHERN AUTHORS' AWARD: Ben Lucian Berman, *Blow For a Landing*.

1940.—AMERICAN CIVIL LIBERTIES UNION (\$50 each in addition to royalties): Philo Higley, *First Freedom*; Noel Houston, *According to Law*. AMERICAN HISTORICAL ASSOCIATION PRIZES: GEORGE LOUIS BEER PRIZE (\$240), Richard Heathcote Heindel, *American Impact on Great Britain, 1898-1914*; HERBERT BAXTER ADAMS PRIZE (\$200), John Shelton Curtiss, *Church and State in Russia*; JOHN H. DUNNING PRIZE (\$100), Richard William Leopold, *Robert Dale Owen*. AMERICAN TRACT SOCIETY PRIZE BOOKS: First prize (\$1,000), Samuel Marinus Zwemer, *The Glory of the Manger*; second prize (\$500), Clarence E. N.

Macartney, *Christian Faith and the Spirit of the Age*; third prize (\$250), Wick Broomal, *The Holy Spirit*. JOHN ANISFIELD AWARD (\$1,000): E. Franklin Frazier, *The Negro Family in the United States*. ATLANTIC NOVEL PRIZE (\$10,000): Nina Fedorova (Mrs. Antonia Riasanovsky), *The Family*. CARL M. BOHNERBERGER MEMORIAL MEDAL (Southeastern Library association), Harry Lee, *Fox in the Cloak*. BROSS FIFTIETH ANNIVERSARY PRIZE (\$15,000, Bross fund, Lake Forest university): Harris Franklin Rall, *Christianity*. COMMONWEALTH CLUB OF CALIFORNIA AWARDS TO CALIFORNIA AUTHORS: Gold medals: John Steinbeck, *Grapes of Wrath*, and Franklin Walker, *San Francisco's Literary Frontier*. Silver medals: Agnes Newton Keith, *Land Below the Wind*; Robin Lampson, *Death Loses a Pair of Wings*; Donald Culross Peattie, *Flowering Earth*; Mary Virginia Provines, *Bright Heritage*; William Saroyan, *The Time of Your Life*. DIAL PRESS AWARD FOR TEACHERS (\$1,000): Sophia Belzer Engstrand, *Miss Munday*. DOCK STREET THEATRE'S (Charleston, S.C.) NATIONAL PLAYWRITING AWARD (c. \$200): Albert Carriere, *Danbury Fair*. DODD, MEAD-REDBOOK PRIZE NOVEL (\$10,000): Harlow Estes, *Hildreth*. DODD, MEAD RED BADGE DETECTIVE STORY: David Keith, *A Matter of Iodine*. JULIA ELLSWORTH FORD FOUNDATION CHILDREN'S BOOK CONTEST (\$2,000): Lucy Embury, *The Listening Man*. FRIENDS OF AMERICAN WRITERS' MIDWESTERN PRIZE (\$1,000): Elgin Earl Grosedclose, *Ararat*. GUGGENHEIM FELLOWSHIPS (c. \$2,400 each): Herman J. Broch, Ward Allison Dorrance, John Dos Passos, Lloyd Frankenberg, Lewis Galantieri, Alfred Kazin, Edwin M. Lanham, Andrew Nelson Lytle, Delmore Schwartz, Christine Weston, Howard Wolf. SIDNEY HOWARD AWARD (Playwrights' company): Robert Ardrey. HOWELLS MEDAL FOR FICTION (American Academy of Arts and Letters): Ellen Glasgow. ALFRED A. KNOPF FELLOWSHIPS (\$1,200 each): Wallace M. Kelly, Wheaton J. Lane, Henry Ladd Smith. LEAGUE OF AMERICAN WRITERS FELLOWSHIPS TO EXILED WRITERS (\$100 each): Oskar Maria Graf, Will Schaber, Bodo Uhse. ROI COOPER MEGRUE PRIZE (\$500, Dramatists' guild): Howard Lindsay and Russel Crouse, *Clarence Day's Life with Father Made into a Play*. NATIONAL BOOK AWARDS FOR 1939 (American Booksellers association): Elgin Earl Grosedclose, *Ararat*; Antoine de Saint Exupéry, *Wind, Sand and Stars*; Dalton Trumbo, *Johnny Got His Gun*; John Steinbeck, *Grapes of Wrath*. NATIONAL INSTITUTE OF ARTS AND LETTERS GOLD MEDAL: Robert Emmet Sherwood. NATIONAL POETRY CENTER MEDAL OF HONOR: Jessie Belle Rittenhouse, *Moving Tide*. JOHN NEWBERRY MEDAL (most distinguished children's book, American Library association): James Daugherty, *Daniel Boone*. NEW YORK DRAMA CRITICS' AWARD: William Saroyan, *The Time of Your Life*. NEW YORK HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL CONTEST (\$250 each): Lucy Herndon Crockett, *That Mario*, and James Douglas Adams, *Cap'n Ezra, Privateer*. O. HENRY MEMORIAL AWARDS (best short stories): first prize (\$300), Stephen Vincent Benét, *Freedom's a Hard-bought Thing*; second prize (\$200), Roderick Lull, *Don't Get Me Wrong*; third prize (\$100), Edward Havill, *The Kill*. PARENTS' MAGAZINE MEDAL: Mrs. Sidonie Matsner Gruenberg, *We, the Parents*. POETRY (magazine) PRIZES (\$100 each): Jeannette Sewell Davis, Kenneth Fearing, Robinson Jeffers, Louis MacNeill, Muriel Rukeyser, David Wolff. POETRY SOCIETY OF AMERICA: medal, Padraic Colum; first prize (\$100), Helen Morrow, *Marcus Aurelius in Bohemia*; second prize (\$50), Harold Vinal, *Impossible Rendezvous*. PULITZER PRIZES (\$1,000 in each class): fiction, John Steinbeck, *Grapes of Wrath*; drama, William Saroyan, *The Time of Your Life*; history, Carl Sandburg, *Abraham Lincoln: the War Years*; biography, Ray Stannard Baker, *Woodrow Wilson: Life and Letters*, vols. vii and viii; poetry, Mark van Doren, *Collected Poems*. SOCIETY FOR THE LIBRARIES AT NEW YORK UNIVERSITY GOLD MEDAL: Katherine Anne Porter, *Pale Horse, Pale Rider*. SOUTHERN AUTHOR'S AWARD (\$100, Southern Women's National Democratic organization): Hamilton Basso, *Days Before Lent*. TEXAS INSTITUTE OF LETTERS SILVER MEDAL: Dora Neill Raymond, *Captain Lee Hall of Texas*. YALE SERIES OF YOUNGER POETS: Norman Rosten, *Return Again, Traveler*. YOUNG PEOPLE'S CHOICE AWARD (Pacific Northwest Library association): Dell J. McCormick, *Paul Bunyan Swings his Axe*.

1941.—AMES PRIZE (Harvard Law school): Professor James C. Bonbright of Columbia university and Professor Isaiah L. Sharfman of the University of Michigan for distinguished writing in the legal field. JOHN ANISFIELD AWARD (\$1,000 for the outstanding book on race relations): (*Saturday Review of Literature*) Louis Adamic, *From Many Lands* (Harper). ATLANTIC MONTHLY PRESS NON-FICTION PRIZE (\$3,000 and royalties): Edith M. Almedingen for her autobiography *Tomorrow Will Come*. ATLANTIC MONTHLY SHORT STORY PRIZE (\$1,000 for the best short story by writers in their 20s): John D. Weaver, *Clouds of Glory*. GEORGE LOUIS BEER PRIZE (American Historical association) (\$240): Richard H. Heindel, *The American Impact on*

Great Britain, 1898-1914. BROSS PRIZE (Lake Forest college, Ill.) (\$15,000): Harris Franklin Rall, *Christianity: An Inquiry into Its Nature and Truth*. CATHOLIC LITERARY AWARD (Gallery of Living Catholic Authors, Webster Groves, Mo.) (an honorary scroll): Eric Gill, *Autobiography*. CHICAGO FOUNDATION FOR LITERATURE: Professor Percy Holmes Boynton of the University of Chicago for distinguished service to literature. COMMONWEALTH CLUB OF CALIFORNIA.—GOLD MEDAL GENERAL LITERATURE PRIZE: Stewart Edward White, *Wild Geese Calling*. GOLD MEDAL SCHOLARSHIP PRIZE: Carl Thurston, *The Structure of Art*. SILVER MEDALS: Kenneth Rexroth, *In What Hour*; Doris Gates, *Blue Willow*; Harold Lamb, *The March of the Barbarians*; William Saroyan, *My Name is Aram*; Thomas A. Bailey, *A Diplomatic History of the American People*. DODD, MEAD PRIZES, THE INTER-COLLEGIATE LITERARY FELLOWSHIP: Maureen Daly, *Seventeenth Summer*; RED BADGE DETECTIVE PRIZE, Susannah Shane, *Lady in Lilac*; Eleanore Kelly Sellars, *Murder à la Mode*. WESTERN STORY NOVEL PRIZE: Peter Dawson, *The Crimson Horseshoe*. FRIENDS OF AMERICAN WRITERS AWARD (\$1,000 to promote high standards and ideals in American writing): Marcus Goodrich, *Delilah*. GREYSTONE BOOKMAN'S PRIZE: Albert Idell, *Pug*. HARPER NOVEL PRIZE (\$10,000): Judith Kelly, *Marriage Is a Private Affair*. O. HENRY MEMORIAL AWARDS: first prize (\$300), Kay Boyle, *Defeat*; second prize (\$200), Eudora Welty, *A Worn Path*; third prize (\$100), Hallie Southgate Abbott, *Eighteenth Summer*; a special prize (\$100) for first published short story, Andy Logan, *The Visit*. AVERY AND JULE HOPWOOD AWARDS (University of Michigan): Beatrice Borst, *Nearer the Earth*. HOUGHTON MIFFLIN LIFE IN AMERICA AWARDS: Agnes Morley Cleveland, *No Life For a Lady*; and Donald Culross Peattie, *The Road of a Naturalist*. THOMAS JEFFERSON SOUTHERN AWARDS: Elizabeth Lee Wheaton, *Mr. George's Joint*; silver medal to Eloise Liddon, *Some Lose Their Way*. ALFRED A. KNOPF LITERARY FELLOWSHIPS: Berenice D. Thorpe, W. E. Binkley, Mitchell V. Charnley. LATIN AMERICAN PRIZE (\$2,500): Ciro Alegria, *Broad and Alien is the World*. LIMITED EDITIONS CLUB GOLD MEDAL: Ernest Hemingway, *For Whom the Bell Tolls*. NATIONAL BOOK AWARDS (American Booksellers Association): Richard Llewellyn, *How Green Was My Valley*, Hans Zinsser, *As I Remember Him*, Perry Burgess, *Who Walk Alone*. NEW YORK DRAMA CRITICS' AWARD: Lillian Hellman, *Watch On the Rhine*, Emlyn Williams, *The Corn Is Green*. NEW YORK UNIVERSITY SOCIETY FOR LIBRARIES GOLD MEDAL: Perry Burgess, *Who Walk Alone*. PARENTS' MAGAZINE MEDALS: Florence Powdermaker and Louise Ireland Grimes, *Children In The Family*; Lois Hayden Meek, *Your Child's Development and Guidance, Told in Pictures*. PULITZER PRIZES: novel, no award; drama, Robert E. Sherwood, *There Shall Be No Night*; history, Marcus Lee Hansen, *The Atlantic Migration*; biography, Ola Elizabeth Winslow, *Jonathan Edwards*; poetry, Leonard Bacon, *Sunderland Capture*. POETRY (magazine) AWARDS (\$100 each): Archibald MacLeish, Paul Engle, Stanley J. Kunitz, Karl J. Shapiro, A. J. M. Smith, Frederic Prokosch. REYNAL AND HITCHCOCK NON-FICTION PRIZE (\$2,500): W. T. Stace, *The Destiny of Western Man*. MARY ROBERTS RINEHART MYSTERY NOVEL PRIZE: A. R. Hilliard, *Justice Be Damned*. SATURDAY REVIEW OF LITERATURE AWARD FOR DISTINGUISHED SERVICE TO AMERICAN LETTERS: Ellen Glasgow. CONSTANCE LINDSAY SKINNER MEDAL (Women's National Book association): Blair Niles. TEXAS INSTITUTE OF LETTERS BOOK AWARD: George Sessions Perry, *Hold Autumn in Your Hand*. YALE SERIES OF YOUNGER POETS: Jeremy Ingalls, *The Metaphysical Sword*. THE CALDECOTT MEDAL FOR THE MOST DISTINGUISHED AMERICAN PICTURE BOOK FOR CHILDREN: Robert Lawson, *They Were Strong and Good*. Auden, *Look Stranger*; 1940, Michael Thwaites, *Milton Blind*. **CARNEGIE MEDAL:** 1937, Eve Garnett, *The Family from One End Street*; 1938, Noel Streatfield, *The Circus is Coming*; 1939, Eleanor Dooley, *Radium Woman*; 1940, Kitty Barne, *Visitors from London*; 1941, M. Treadgold, *We Couldn't Leave Dinah*; 1942, "B.B." (D. J. Watkins-Pitchford), *The Little Grey Men*; 1943, no award; 1944, Eric Linklater, *The Wind on the Moon*; at the end of 1946 no further awards had been announced. **JOHN LLEWELYN RHYS MEMORIAL PRIZE** (£25): 1941, Michael Richey, *Sunk by a Mine*; 1942, Morwenna Donnelly, *Beauty for Ashes*; 1943, Alun Lewis, *The Last Inspection*; 1944, James Aldridge, *The Sea Eagle*; 1945, Oriol Malet, *My Bird Sings*. **NEWDIGATE PRIZE:** 1937, M. Stanley-Wrench, *Man in the Moon*; 1938, Michael Thwaites, *Milton Blind*; 1939, K. S. Kitchin, *Dr. Newman Revisits Oxford*; no further awards had been announced at the end of 1946. **BRAZIL PRIZE** (£50): Robert Conquest, *For the Death of a Poet*. **WILLIAM HEINEMANN BEQUEST AWARD** (£200): 1945, Norman Nicholson, *Five Rivers*.

France

GRAND PRIX DE LITTÉRATURE (10,000 francs): 1938, Tristan Derème; 1939, Jacques Boulenger; 1940, Edmond Pilon; 1941, Gabriel Faure; 1942, Jean Schlumberger; 1943, Jean Prévost; 1944, André Billy; 1945, Jean Paulhan; 1946, Daniel-Rops. **PRIX DU ROMAN** (5,000 francs): 1937, G. de Pourtales, *la pêche miraculeuse*; 1938, Jean de la Varende, *Le Centaure de Dieu*; 1939, Antoine de Saint Exupéry, *Terre des hommes*; 1940, Edouard Peisson, for his collected works; 1941, Robert Bourget-Pailleron,

for his collected works; 1942, Jean Blanzat, *L'orage du matin*; 1943, J. H. Louwyck, *Danse pour ton ombre*; 1944, Pierre Lagarde, *Valmaurie*; 1945, Marc Blancpain, *Le Solitaire*; 1946, Jean Orieux, *Fontagne*. PRIX LOUIS BARTHOU: 1940, Victor Giraud; 1941, Henri Malo; 1942, Paul Valéry; 1943, Louis Gillet; 1944, René Grousset; 1945, Mme. Paul Hazard; 1946, Henri de Montfort. PRIX GONCOURT (value 5,000 francs): 1937, Charles Plisnier, *Faux passeports*; 1938, Henri Troyat, *L'araignée*; 1939, Philippe Hériat, *Les enfants gâtés*; 1940, reserved for a returning prisoner of war; 1941, Henri Pourrat, *Vent de mars*; 1942, Marc Bernard, *Pareils à des enfants*; 1943, Marius Grout, *Passage de l'homme*; 1944, Elsa Triolet, *Le premier accroc coûte 200 francs*; 1945, Jean-Louis Bory, *Mon village à l'heure allemande*; 1946, Francis Ambrière, *Les grandes vacances* (M. Ambrière is a returned prisoner of war and this prize was awarded for 1940); 1946, Jean-Jacques Croutier, *Histoire d'un fait divers*. PRIX FEMINA (5,000 francs): 1937, Raymonde Vincent, *Campagne*; 1938, Felix de Chazournes, *Caroline ou le Départ pour les îles*; 1939, Paul Vialar, *La rose de la mer*; 1940 to 1943, prize suspended; 1944-1945, anthology in six volumes, *Sous l'oppression*; 1945, Anne-Marie Monnet, *Le Chemin du soleil*. PRIX THÉOPHRASTE-RENAUDOT: 1937, Jean Rogissart, *Mervale*; 1938, P. J. Launay, *Léonie la bienheureuse*; 1939, Jean Malaquais, *Les javanais*; 1940, no award; 1941, Paul Mousset, *Quand le temps travaillait pour nous*; 1942, Roger Gaillard, *Les liens de chaîne*; 1943, Dr. Soubiran, *J'étais médecin avec les chars*; 1944, Roger Peyrefitte, *Amitiés particulières*; 1945, Henri Bosco, *Le mas théotime*; 1946, David Rousset, *L'univers Concentrationnaire*. PRIX INTERALLIE (honorary award, suspended from 1940 to 1944); 1937, Romain Roussel, *La vallée sans printemps*; 1938, P. Nizan, *La conspiration*; 1939, R. de Lafforest, *Les figurants de la mort*; 1945, Roger Vaillant, *Drôle de jeu*. PRIX DES CRITIQUES: 1945, Romain Gary, *Education Européenne*; 1946, Agnes Chabrier, *Vie des morts*.

U.S.S.R.

The principal literary awards are the STALIN PRIZES inaugurated in 1941, and administered by the Stalin Prize committee. Two first prizes of 100,000 roubles and two second prizes of 50,000 roubles are given for outstanding works in prose, poetry, drama, and literary criticism. First prizes: Ilya Erenburg, *The Fall of Paris* (novel); V. Yan (Yanchevetsky), *Genghiz Khan* (novel); Nikolai Tikhonov, *Kirov is with us* (poem) and other verses; Konstantin Simonov, *The Man from Our Town* (play); Alexander Korneichuk, *In the Ukrainian Steppes* (play); 1942, Alexei Tolstoy, *Road to Calvary* (novel); Wanda Wasilewska, *Rainbow* (novel); Maxim Rylsky, *Song of my Motherland* (poem) and other verses; Alexander Korneichuk, *Front* (play); Leonid Leonov, *Invasion* (play); 1943-1944, Vyacheslav Shishkov, *Emelyan Pugachov* (novel); Alexander Stepanov, *Port Arthur* (novel); Arkadi Kulishov, *Banner of the Brigade* (poem); Alexander Tvardovsky, *Vassili Tyorkin* (poem); Alexei Surkov, for his popular songs and poems; Mikhail Lozinsky for his outstanding translation of Dante's *Divina Commedia*; Alexei Tolstoy, *Ivan the Terrible* (play); 1945, Alexander Fadeyev, *Young Guard* (novel); Aibek, the first Uzbek writer who could claim to have a truly realistic approach to literature, *Navoi* (biographical novel); Boris Lavrenev, *For Those who Are at Sea* (play); and Avetik Saakian (Armenia) and Yakub Kolas (Byelorussia), for their poems. (For prizes in other fields see ART EXHIBITIONS; MATHEMATICS; MINERALOGY; MOTION PICTURES; RED CROSS; SCULPTURE; SOCIETIES AND ASSOCIATIONS; THEATRE; etc.; see also NOBEL PRIZES; PULITZER PRIZES; and the articles on national literature, e.g., FRENCH LITERATURE, SPANISH LITERATURE, etc.)

Lithium Minerals

Commercial demand for lithium is filled by the natural minerals amblygonite, spodumene and lepidolite, and as dilithium sodium phosphate, obtained as a by-product in potash recovery at Searles Lake, Calif. Combined production, ores and compounds, in the United States was as follows, in short tons:

Production, LiO ₂ Content			Production, LiO ₂ Content		
1937	1,357	?			
1938	892	?	1942	5,405	299
1939	1,990	?	1943	8,155	463
1940	1,961	113	1944	13,319	848
1941	3,932	209	1945	3,440	274

With the termination of war contracts, output dropped in 1945 almost to the prewar level, and the industry attempted to develop peacetime uses.

Lépidolite is used directly as a component of certain types of glass, to increase the fluidity, index of refraction and toughness. Spodumene counteracts shrinkage in ceramic bodies, and in glazes gives a lower maturing temperature, thus lessening the strain on furnace refractories. Lithium chloride and fluoride are used in welding rod coatings. A lithium-calcium alloy is effective in removing nitrogen and oxygen from molten copper, and lithium has been used as a constituent of bearing alloys. Lithium salts have been used as a dehydrating agent in air conditioning, and in the production of a noncorrosive atmosphere in furnaces for heating steel. An outstanding war development was the use of lithium hydride as a source of hydrogen for the inflation of the radio antenna balloons that were a part of navy rescue equipment. (G. A. Ro.)

Lithuania

Established as a republic after World War I, Lithuania was the southernmost of the three Baltic states on the eastern shore of the Baltic sea. Bounded on the north by Latvia, on the northeast tip by the U.S.S.R., on the east and southeast by Poland and on the south and southwest by East Prussia, its area (including Klaipeda [Memel] but excluding Vilnius [Wilno]) was 21,489 sq.mi. Total population (census 1938) 2,549,668; 1941 estimate, 2,879,070 (including Vilnius, but excluding Klaipeda). The chief towns: Kaunas (capital, 1938) 220,000 (1941 est.) 120,000; Klaipeda (1938) 50,000; Panevezys (1938) 28,000 (1941 est.) 25,000; Siauliai (1938) 30,000 (1941 est.) 27,000.

A new constitution was promulgated on May 12, 1938. Its main features were: (1) The president of the republic to be elected for a term of seven, in place of the previous term of three, years; (2) the president to appoint or to dismiss the prime minister and state comptroller; (3) when the seimas (parliament) was not in session the president could enact laws, which, however, were to be approved or annulled when the seimas was again in session; (4) the president could dissolve the seimas before its term of five years had expired. President: Antanas Smetona (Dec. 17, 1926-June 15, 1940). Prime ministers: Juozas Tubelis (June 13, 1934-Dec. 4, 1938); Vladislovas Mironas (Dec. 5, 1938-Nov. 20, 1939); Antanas Merkys (Nov. 21, 1939-June 15, 1940); Justinas Paleckis (after June 18, 1940).

Territorial Grab-bag.—Until 1938 no official relations existed between Lithuania and Poland, the government of Kaunas refusing to recognize the Polish-Lithuanian fron-

tier fixed as final by Great Britain, France, Italy and Japan on March 15, 1923. Lithuania continued to claim Vilnius as its historic capital, although out of its total population of 195,100 (Polish census of 1931) 128,600 (66%) were Poles, 54,600 (28%) Jews, 7,400 Russians and about 2,000 Lithuanians. On March 18, 1939, Poland sent an ultimatum to Lithuania demanding the immediate opening of the frontier—that is, the recognition of it—and the establishment of normal diplomatic relations between the two countries. Lithuania agreed.

Within a year Lithuania was presented with another ultimatum which this time meant the loss of its only port and of the lower reaches of its single notable river—Nemunas (Niemen). On March 21, 1939, Germany sent an ultimatum to Lithuania asking for the immediate return of Klaipeda (Memel), and the Lithuanian government had to restore to the third reich a territory of 1,099 sq.mi. with a population of 152,660 (off. est. Jan. 1, 1938). This territory, detached from Germany by the treaty of Versailles, had been given to Lithuania by Great Britain, France, Italy and Japan on May 8, 1924.

Although the signing of the German-soviet nonaggression pact of Aug. 23, 1939, was made known to the world, all the contents were not disclosed. A secret additional protocol clause stated:

In the event of a territorial and political transformation of the areas belonging to the Baltic states (Finland, Estonia, Latvia and Lithuania), the northern frontier of Lithuania will automatically be established as the boundary of the spheres of interest of Germany and the U.S.S.R., and at the same time both parties will recognize Lithuania's claim to the Vilna territory.

The protocol, like the pact, was signed by Joachim von Ribbentrop and Vyacheslav M. Molotov. Evidently the terms of this protocol were not satisfactory, since in Moscow on Sept. 28, 1939, a further document was signed by the same plenipotentiaries. It was the second secret additional protocol to the German-soviet nonaggression pact. It read:

The secret additional protocol, signed on Aug. 23, 1939, is changed in paragraphs 1 and 2 in such a way that the territory of the Lithuanian state is included into the Soviet union's sphere of influence. . . . At the moment when the soviet government takes steps on Lithuanian territory for the purpose of realizing its interests, the present German-Lithuanian frontier will be rectified in such a way that the Lithuanian territory south and south-west of the line marked on the attached map will fall to the Germans.

On Oct. 10, 1939, a mutual assistance pact was signed in Moscow by Juozas Urbšys, the Lithuanian minister for foreign affairs, in accordance with which Lithuania was compelled to admit soviet garrisons and to grant air bases on Lithuanian territory. The soviet government solemnly reiterated its promise to respect Lithuania's sovereignty and not to interfere in Lithuania's internal affairs. Article VII of this mutual assistance pact read as follows:

Fulfillment of this treaty shall not in any way affect the sovereign rights of the contracting parties, in particular their state organization, economic and social systems, military measures, and generally the principle of nonintervention in internal affairs.

In the peace treaty of Moscow (July 12, 1920) Russia had not only "voluntarily and for ever renounced all sovereign rights possessed by Russia over the Lithuanian people and territory," but also "ceded" to Lithuania the province of Vilnius—an area of about 11,194 sq.mi. with a mainly Polish population of 1,275,000. On Oct. 10, 1939, however, Russia "ceded" the Vilnius area to Lithuania in

much narrower confines than those of July 12, 1920—an area of about 3,219 sq.mi. with a population of 489,000 (69% of which was Polish). Foreign Commissar Molotov, speaking in Moscow on Oct. 31, 1939, said: "The U.S.S.R. decided to hand over the city of Vilnius to the Lithuanian republic not because it is inhabited by a Lithuanian majority. No, indeed, Vilnius has a majority of non-Lithuanian population." After the loss of Klaipeda and the gain of Vilnius the total area of Lithuania was 22,958 sq.mi. with population estimated at 2,879,070.

Three Invasions.—On June 15, 1940, the soviet army crossed the Lithuanian frontier and occupied the country. With the Red army came the special soviet emissary, Vladimir G. Dekanozov, one of the deputy commissars for foreign affairs. He directed the change in government. (President Smetona fled the country and went to the U.S., where he died in Cleveland, O., on Jan. 9, 1944.) On June 18, 1940, Justinas Paleckis, an obscure journalist, was chosen as head of the puppet government. The Russians ordered Paleckis to dissolve the seimas and to stage new elections.

Notices appeared on July 7 that an election was to be held on July 14. No party, except the Communist, was allowed to put forward candidates. The newly elected members of the "people's seimas" were convened on July 21. The first and only question on the agenda was a resolution requesting the soviet union to permit Lithuania to become a member of the U.S.S.R. Having passed the resolution, the "people's seimas" dispersed. The soviet union granted the request on Aug. 3, 1940.

In July 1940 the soviet union demanded that every foreign legation and consulate in Lithuania terminate its activities and leave the country not later than Aug. 15, 1940. This was done, although in some cases a further two weeks' grace was given. After that date information about events in Lithuania had not the same accuracy as previously. However, it was certain that during the year of Russian occupation mass arrests and deportations to Siberia numbered many thousands.

The German forces entered Lithuania on the day Germany attacked the U.S.S.R.—June 22, 1941. A general revolt against soviet rule broke out the same day. Lithuania was proclaimed part of the newly formed *Ostland* province of greater Germany. An attempt was made to gain the favour of the Lithuanian people by the Germans' posing as liberators, but German actions proved the contrary. New settlers were brought from Germany. What had previously been passive resistance to the German invaders became active in many parts. The Germans massacred the Jewish population; scarcely 10% was alive when the Russians returned.

At the beginning of July 1944 the soviet army again crossed the eastern boundary of Lithuania and drove the Germans out of the country by the end of the same month. A second period of Russian occupation started. The sovietization of Lithuania, begun under the first Russian occupation, was renewed with increased vigour. While passive resistance was the part played by the Lithuanian people to the first occupation, active resistance in several areas was a feature of the second. Reliable news of conditions in Lithuania was fragmentary, but it was reported that numerous bands of Lithuanian "bandits" were engaging in armed conflict with the Russian troops and the N.K.V.D. That this resistance was continuing in 1946 could be deduced from the *Order of the People's Commissar of the Lithuanian Soviet Socialist Republic* published in Vilnius on Feb. 15, 1946: "Chiefs of districts and communes of the people's commissariat of the interior, the armed forces of

the N.K.V.D. and groups of the people's defenders to clear up all districts of the Lithuanian S.S.R. from the remnants of Lithuanian-German Nationalists." (H. F. AN.)

Little Entente

See CZECHOSLOVAKIA; RUMANIA; YUGOSLAVIA.

Litvinov, Maxim Maximovich

Litvinov (1876–), Russian politician, was born July 17, 1876 in Bialystok, Russia. He joined the Social-Democratic party in 1898. Litvinov supported Lenin in the factional clash of 1904. After the revolution of 1917 he was the party's plenipotentiary in London, where he was imprisoned as a hostage. He took part in conferences at Genoa and The Hague, led soviet delegations at the 1927, 1928 and 1929 sessions of the preliminary disarmament commissions of the League of Nations, and in 1928 signed the Kellogg pact for the U.S.S.R. Made commissar for foreign affairs in 1930, he championed collective security at League of Nations sessions. He was suddenly dropped from his foreign office post and replaced by Molotov on May 3, 1939, in the midst of negotiations with Britain and France for a general mutual assistance pact; the mystery of his removal was solved in Aug. 1939 when Ger-

many concluded a nonaggression pact with the U.S.S.R. Litvinov was expelled from the communist party in Feb. 1941, but returned to favour after the nazis attacked the U.S.S.R. in June 1941, and was appointed soviet ambassador to the U.S. in November of that year. In Aug. 1943 he was replaced as ambassador by Andrei Gromyko. This move, coupled with the removal of Ivan Maisky from his post as ambassador at London, seemed to be an expression of Russian dissatisfaction with Anglo-U.S. failure to open a second military front in Europe. In March 1946 Litvinov was named deputy minister of foreign affairs.

Liverpool

A municipal, county and parliamentary borough and seaport of Lancashire, England, Liverpool is 201 mi. north-west of London by rail. Population 864,000 (1939). Area 42.7 sq.mi.

During the years 1937–46 Liverpool, besides being one of the great British seaports, grew to be an important industrial centre. Before World War II, civic administrators set about attracting industrialists to the area; tracts of land were scheduled for industrial development by the corporation, which also extended loans at a low rate of interest to assist firms in the initial stages. Industrial growth was partly arrested by the outbreak of war in 1939, but most of the factories changed over to wartime production and the erection of a large ordnance factory on the outskirts, subsequently purchased by the corporation for additional industrial expansion, further augmented the city's war effort. With the return of peace, industrial growth continued.

Through its geographical position, Liverpool became the life line of the west during World War II, and its former mercantile prosperity returned with the influx of thousands of vessels of all types. The Mersey Docks and Harbour board, which had formed a Port Emergency committee in 1936, handled the enormous increased traffic smoothly and with expedition. Its strategic importance earmarked the port for attack from the air, and it received the full fury of the luftwaffe, particularly in the eight nights' "May blitz" of 1941, when 3,966 people lost their lives and 3,812 were seriously injured. Great havoc was wrought on the dock estate and immediate environs, and extensive damage was also suffered in the residential area. The port was kept open by the magnificent work of the civil defense, and the 50,000 dock labourers, ship repairers and transport workers who toiled day and night to turn the convoys round in the shortest possible time. More than 143,000,000 tons of shipping and 75,150,100 tons of cargo were dealt with. In addition, 4,700,000 troops passed through the port. A very important part was played by the Mersey tunnel and the airport in supplementing the rapid dispersal of vital war material and supplies. It was from Liverpool that the battle of the Atlantic was fought, and the commander of the northwestern approaches had his headquarters there.

The postwar period saw a transition in handling of cotton, upon which much of the city's commerce was built. The government decided to continue the bulk purchasing which it had operated during the war, and this materially altered some of the long-established merchanting arrangements carried on in Liverpool. The city, however, quickly adjusted itself to the new situation.

Air-raid damage gave the city an opportunity of replanning; the proposed scheme included plans for an inner city ring road, with the idea of introducing the principle of gyratory traffic.

(A. E. SN.)

The world's livestock averaged nearly the same during the decade 1937-46 but varied greatly in different countries. War losses were heavy in Europe and in the western soviet union. The world's total number of cattle as estimated by the U.S. department of agriculture was 709,800,000 head in 1945 compared with an average of 723,000,000 head for the five-year period 1936-40. During this period there were increases of about 17% in North America, a loss of about 12% in Europe, 7% in Asia and 22% in the soviet union. The numbers in South America, Africa and Oceania changed but little. The world's hog total was estimated to have increased from an average of 283,500,000 head in 1936-40 to nearly 280,000,000 head in 1944. The increases in the United States and Canada were large, from about 48,000,000 head in the United States in 1936-40 to the record of 83,853,000 head in 1944, while in Canada hogs increased from 4,078,000 head to 9,473,000 head in 1944. The decline in Europe amounted to a drop from 81,000,000 head in 1936-40 to about 55,000,000 head in 1944. Most of this loss was in Germany, Poland, the Netherlands, France and Southeastern Europe. The United Kingdom cut hog numbers, because of feed shortage, from 4,380,000 head in 1936-40 to 1,866,000 head in 1944. Denmark was able to maintain its hogs almost at the prewar level because the Germans expected to continue to use Danish supplies after their expected victory. Sheep numbers declined in most countries except Australia, New Zealand and North America. In the United States an average of 51,462,000 head was reported for 1936-40, which increased to a peak of 56,735,000 head in 1942 and then began a decline. Canada maintained its sheep numbers at close to the prewar average of 2,651,000 head throughout the decade. Great Britain sharply reduced sheep numbers because of feed shortages from a prewar number of about 26,100,000 head to 20,340,000 head in 1944.

The horse and mule numbers in the world as a whole declined because of war losses and the continued reduction in numbers in the United States with the extension of motor truck and tractor. In Canada, Britain and Europe the same trend toward the horseless age was apparent. No comprehensive or reliable statistics were available on the poultry numbers of the world since the totals fluctuated sharply from year to year in many countries. Domestic fowl is not a commercial industry subject to observation as is that of larger animals marketed in central markets. Competent observers believed, however, that the effects of wartime food shortages led to the raising of more small flocks for home supplies of eggs and meat.

Total animal units on United States farms reached a record high point in 1944 as estimated by the U.S. department of agriculture. Combining all animals on a basis of feed consuming equivalents, the total units on farms in 1937 were 122,401,000; the high record of 1944 was 171,149,000.

The variations and changes in different classes of U.S. livestock were more than ordinarily unusual. Horses and mules continued to decline in numbers. All cattle increased until 1944 and then declined, likewise milk cows, hogs and chickens. Sheep made a slight advance at the outbreak of World War II, then resumed the downward trend and finished the decade with a loss of nearly 12%. Turkeys became steadily more numerous. These changes reflected

the favourable years for feed crops and the sustained or weakened war demand. The declines at the end of the war indicated the farmers' doubt regarding future markets.

The war demand for meat for both U.S. armed forces and civilians was met, and the increased consumption stimulated by full employment was amply supplied. Per capita consumption of meat had dropped to a low point of 115.9 lb. per capita in 1935, the lowest on record, and stood at 125.4 lb. per capita in 1937. By 1944, total consumption had increased to 164.6 lb. per capita. Consumption by civilians alone was only 149.6 lb. in 1944, however, because of the liberal supplies for the armed forces and the reserves taken for lend-lease. The large production of meat animals in the United States was the world's principal source of supply during the war.

Prices of livestock and livestock products in the United States reacted promptly to the outbreak of the war in 1939. The index of prices received by producers for meat animals rose from 112 in 1939 to 209 in 1943, and then declined slightly in 1945 and 1946. Measured in total cash receipts by producers, the livestock sold brought \$2,272,000,000 in 1939 and \$5,677,000,000 in 1944, an increase of more than 100%. This was not due to higher prices alone but also to the increased volume.

Livestock prices as measured by the index of the U.S. department of agriculture stood at 93 as the average of 1930-34 compared with the base of 100, 1909-14. The general price level moved up steadily through the war years to an average of 203 for 1945 and by the middle of 1946 had reached 207. Prices of meat animals advanced from an index of 85 in 1930-34 to a top of 210 in 1945 and 226 by June 1946. The advance varied somewhat between kinds of livestock. Good grade steers sold at Chicago at around \$16 per 100 lb. through most of 1944-46 and feeder steers at Kansas City at around 2 cents per lb. less. Prices of hogs were at the ceiling of \$14.76 and later \$14.85 per 100 lb. through most of 1944, 1945 and 1946. During the July period when O.P.A. was not in action the livestock markets jumped to a new high record for a few weeks. Slaughter lambs ranged from around \$14 per 100 lb. to a top of \$16.82 through 1944-46. While prices of horses and mules declined, the sales of these did not amount to enough to change the general livestock total materially. Prices of poultry advanced from the low index of 95 in 1939 to a top of 196 in 1945.

Dairy cattle, particularly milk cows, showed a similar advance.

38 **Local Government***See MUNICIPAL GOVERNMENT.***Locusts***See ENTOMOLOGY.***Logistics of World War II**

Though some advance preparations in logistics (the science of providing material means and services to support the military effort) had been made in the United States and the United Kingdom prior to World War II, neither nation was adequately prepared logistically when war came.

In Sept. 1939, as the German horde erupted into Poland, the U.S. made small increases in its military establishment. After the fall of France in 1940, further moderate increases were made, but only after extended debate. In March 1941, the U.S. inaugurated its lend-lease program and production was increased to provide munitions to other nations. It was not until the Japanese attack on Pearl Harbor made the position of the U.S. with respect to the war unmistakably clear that political, industrial and labour factions united in determined preparation for war.

Expenditures for rearmament in the United Kingdom in 1938 and 1939 were modest; when France fell in 1940, only about 20% of the nation's economy was applied to military preparations. At that time most of Britain's best military equipment lay captured or destroyed in Belgium and on the beaches of Dunkirk. Stocks of tanks in the United Kingdom numbered 50. Devastating German air attacks on Coventry and other cities signalled that future preparations in the United Kingdom would not proceed unmolested.

The Allied Problem.—The darkest days of the war for the Allies prevailed in early 1942. Axis air power and submarines practically controlled the Mediterranean route to the middle east, necessitating a 12,000-mi. detour of shipping around the Cape of Good Hope to supply British forces fighting desperately to stem the advance of axis forces toward the Suez canal. In the Pacific and far east the Japanese had overrun vast areas and were knocking at the gates of Australia and India. China and the soviet union stood hard pressed and virtually in isolation. Both were in urgent need of logistic assistance. Also, the resources of western Europe, and the sources of tin, rubber, quinine and other materials in the Pacific and far east, essential to Allied preparations, served only to increase the war potential of the axis powers.

The character and magnitude of the logistic tasks confronting the Allies were clearly apparent. Ocean barriers foreshadowed major amphibious operations requiring vast quantities of landing ships and special equipment then practically nonexistent. Such operations required construction of bases in forward areas and the provision of large numbers of auxiliary vessels to support naval forces in protracted operations. Air warfare required huge quantities of planes and bombs and the construction of hundreds of new airfields throughout the world. Ground warfare required the mobilization of the largest forces ever assembled by the United States and the United Kingdom, and the provision of tanks, artillery, motor transportation and supplies in ever-increasing quantities. Widely scattered operations required shipping in quantities not then existing in the entire world. Requirements for petroleum products to operate ships, planes, mechanized units and motor transportation ran to astronomical figures. Materials

to assist China and the soviet union had to be produced, and means had to be devised for their prompt delivery.

The war potential of the Allies was sufficient to meet the demands of these formidable tasks, but time was required for planning, mobilization, the development of facilities and for production. In 1941 and 1942, this time was provided by the heroic defense of Britain by the royal air force, the stubborn soviet resistance, the tenacity of British forces in Egypt, and the victories of U.S. forces in the Coral sea and at Midway.

European Operations.—The initial U.S. and British strategy contemplated the invasion of the continent of Europe in the summer of 1943 from bases in the United Kingdom. To this end, resources were concentrated in Britain as rapidly as they became available, and the preparation of bases to support the invasion was begun. Two events in 1942 were to militate against the timely fulfillment of this plan. First, soviet forces urgently required relief from pressure of German forces and assistance, principally in the form of tanks, planes and trucks. Secondly, the axis advance toward the Suez canal was proceeding with alarming success. Axis victories at Stalingrad and in Egypt and subsequent conquest of the middle east would have been a strategic and logistic disaster for the Allies.

A paucity of equipment, especially landing craft, precluded advancing the date of the cross-channel operation to relieve the situation, and the invasion of North Africa was decided upon as the best within the means available. Accordingly, the cross-channel operation was deferred, and resources of men and materials in Great Britain and in the U.S., destined for that operation, were diverted to the north African operation. Hundreds of U.S. tanks and self-propelled guns were rushed by fast vessels from the United States, around the Cape of Good Hope, to strengthen British forces in Egypt.

To assist the soviets, an overland supply route extending 650 mi. from the Persian gulf to northern Iran, initially established by the British, was taken over by U.S. forces, and deliveries over the route were greatly increased. In July 1944, 334,000 tons of materials were delivered; by summer of 1945, 6,227,000 tons had been transferred to the Russians in northern Iran. In addition, a joint U.S.-British convoy route across the dangerous north Atlantic to northern soviet ports was established, over which several million tons of supplies and equipment were subsequently delivered. In the Pacific, Russian ships carried lend-lease cargoes from the U.S. The eventual assistance given the Russians by the U.S. amounted to about \$11,300,000,000; U.K. assistance to the soviets exceeded \$1,300,000,000.

Two distinct logistic advantages accrued to the Allies from their victories in Africa and the Mediterranean. The short Mediterranean supply route was re-established, and bases were secured for support of future operations against southern France.

From 1942 onward, Allied air bombardment of the continent continued with increasing intensity. Modern air warfare had made possible this attack on German industry and lines of communication behind German forces. Extensive successful attacks reduced resources available to German forces and limited their freedom of movement—precisely the purpose of the Allied bombardment. German divisions in western Europe exceeded those which the Allies could muster in Britain for the cross-channel operation, and, if unimpeded, could assemble at the invasion coast at a more rapid rate than Allied divisions could be put ashore. Therefore, continuing and concentrated attacks were delivered on critical German war industries to

disrupt production and deny replacement equipment and supplies to the German forces, thus reducing their effectiveness. As the invasion date approached, Allied air forces concentrated on the destruction of routes leading to the invasion coast to delay the movement of German forces to that area. The successes achieved during the invasion showed that Allied air power had accomplished its missions well; German logistic capabilities had been dealt mortal blows.

As the Allied air offensive progressed, the concentration of resources and preparation of bases in the United Kingdom to support the cross-channel operation, scheduled for the spring of 1944, were resumed. These preparations presented logistic problems of tremendous magnitude. Over 1,200,000 men, thousands of planes and millions of tons of materials had to be transported from the United States; shelter, training areas, hospital facilities, storage and shop space for these forces and their equipment were required. Several hundred miles of railroad had to be constructed, and more than 20,000 railroad cars and 1,000 locomotives were to be shipped from the United States. More than 100 new airfields had to be constructed and many others expanded and repaired. Storage facilities for millions of barrels of gasoline were required, and an extensive pipe line system developed to deliver gasoline to military installations. Shipments of materials from the U.S. increased monthly, and in the month preceding the invasion amounted to 1,900,000 tons. The United Kingdom was converted virtually into an armed camp.

On June 6, 1944, the assault of the continent, greatest amphibious operation in history, was initiated. Landing ships and craft totalling 3,780, the majority ocean-going types, carried the invasion forces across the channel, accompanied by large U.S. and royal naval covering forces and under an umbrella of aircraft. Two artificial harbours, one encompassing an area of 2 sq.mi., were constructed by sinking ships and caissons towed from Britain. Pipe lines to carry gasoline from Britain were constructed under the channel (operation "Pluto"). A system of supply over the beaches was established upon which the success of the invasion had to depend until adequate ports were captured. Within 90 days more than 2,000,000 Allied troops, and about 3,500,000 tons of materials had been landed over the beaches—an outstanding logistic achievement.

Nevertheless, the need for ports continued urgent. The Germans realized the ultimate dependence of the Allies on ports to support their expanding forces and operations and isolated German garrisons held firmly to coastal ports. The great port of Antwerp, with its facilities intact, finally fell into Allied hands early in Sept. 1944, but it was not until November, after British troops had driven stubborn German forces from the islands guarding the entrance to the port, that it was put into operation. Meanwhile, the invasion of southern France, which had been delayed to permit reuse of landing vessels employed in the cross-channel operation, was successful. By September the ports of Toulon and Marseilles, and the excellent Rhone valley railroad system were in operation. These facilities were ample to supply the southern invasion forces and also to provide important assistance in the supply of central Allied forces until Antwerp was in operation.

The advance of Allied forces across France and the Low Countries proceeded at a more rapid rate than had been anticipated, and units soon outstripped their supply lines. Vital supplies were rushed forward to armoured spearheads in large quantities by transport aircraft and heavy bombers. Special high-speed one-way motor lines were established, of which the "Red Ball" became most

famous, and fuel pipe lines were extended from the coast rapidly to supply advance forces. Prodigious feats of construction and repair of roads, railroads, bridges and airfields were accomplished. More than 4,000,000 Allied troops were being supported in western Europe when Germany collapsed.

Pacific Operations.—Land and air operations in the Pacific, though smaller in magnitude than those undertaken in Europe, were in many respects more complex logistically. Sea and amphibious operations in the vast expanses of the Pacific presented frustrating challenges in matters of supply and transportation.

The principal objective of operations against Japan up to 1944 was to secure bases from which the full power of U.S. military might could be applied against the Japanese homeland after the defeat of Germany. There began in 1942 a series of operations, limited in scope initially by scarcity of resources, but increasing in magnitude in 1943 and 1944 as munitions production in the U.S. assumed enormous proportions, and as resources, additional to those required in Europe, became available. In general, these operations followed a common pattern and posed similar logistic problems. Each was an amphibious operation with landing across open beaches. Then followed the establishment of a supply system over the beaches to support operations for the capture of the objective, and the rapid provision of facilities for supporting land-based aircraft. As early as practicable, airfields were expanded or new ones were built for offensive aircraft; port and naval facilities were constructed; and the area was developed as a base from which to launch and support subsequent air and amphibious operations. As the advance in the Pacific progressed and experience was gained, these tasks were completed with remarkable speed and efficiency. Existing airfields were repaired and put into operation overnight; new airfields sprang up from virgin jungle and on coral atolls in a matter of days.

Amphibious operations required large naval task forces to convoy assault forces, bombard enemy shores, provide carrier air support and protect sea lines of communication. At times, almost constant presence of naval forces was required during the period of the operation. To permit large naval forces to remain in advance areas for protracted periods, large naval bases were established at Espiritu Santo, at Manus and at Guam. Facilities comparable with those of continental U.S. navy yards were installed. Floating drydocks, capable of accommodating the largest vessels, were constructed in the U.S. and towed sectionally to advance bases in the Pacific. Large numbers of auxiliary vessels were added to fleets to provide ready sources of fuel, ammunition, food and other supplies. The logistic structure for support of naval forces in the Pacific was eventually developed to the extent that the greatest naval force ever assembled was able to remain at Okinawa in support of operations ashore continuously for three months.

In the spring of 1945, U.S. forces were in undisputed possession of the Philippines, Okinawa and the Marianas. Behind them stretched numerous large groups of Japanese troops helplessly isolated on Pacific islands; before them lay the Japanese homeland, open to ever-increasing devastation from the air and sea. This situation was brought about largely because, as with Germany, high priority had been given to the destruction of industry and lines of communication. U.S. submarines early began to exact a heavy toll of Japanese shipping. U.S. forces with superior

air and naval power occupied key islands from which they controlled the approaches to strongly held Japanese bases. Deprived of replacements and logistic support, the latter were rendered impotent. Loss of control of the sea deprived Japan of the resources of conquered areas so essential to its industry. This, coupled with destructive air attacks on industrial plants in Japan, prevented the Japanese from replacing, adequately, destroyed shipping, planes and other equipment. Japan's capacity to support a major overseas war began to decline early in 1944; by the summer of 1945 it had been hopelessly crippled, and the Japanese contemplated capitulation. Two atomic bombs hastened the decision.

By that time, extensive preparations were in progress for the invasion of Japan proper. Forces and resources had begun to arrive from Europe in substantial quantities, and shipments from the U.S. increased. The abrupt surrender of Japan posed two perplexing logistic problems. Huge quantities of materials assembled for the invasion on Pacific islands required disposition. Insistent popular demand for the immediate return of troops from overseas created perhaps the greatest transportation problem of the war.

Far Eastern Operations.—The summer of 1943 found China practically isolated from its Allies and desperately in need of munitions, if it were to continue resistance. Small quantities were being flown into China by U.S. aircraft from India, but these were even insufficient to supply U.S. air forces operating in China. Moreover, China's greatest need was for tanks, artillery, trucks and other heavy equipment—items not readily transportable by air. Operations to clear the Japanese out of Burma and to reopen the Burma road from Rangoon into China were highly desirable, but higher priority of European and Pacific operations denied the resources (particularly landing craft) for such a major undertaking. It was decided to conduct operations in north Burma with the limited resources available to drive the Japanese southward and to capture territory over which a new road, several hundred miles long, could be constructed from Assam to join that part of the Burma road which remained in Allied possession. As the advance of British, Chinese and U.S. forces continued slowly southward, under extremely adverse conditions of weather and terrain, engineers followed closely, constructing the road and an accompanying fuel pipe line. The new road was finally completed in Feb. 1945, and during that month 22 convoys comprising 2,170 vehicles travelled the route into China. By the end of August, 123,000 tons of supplies and equipment had been delivered. Shortly after the opening of the road, gasoline flowed into China through a pipe line more than 1,000 miles long.

Supply by air into China continued as construction of the road proceeded. Additional planes and facilities were employed, and a shorter, less hazardous, air route became available as the Allied forces advanced. Deliveries rose from about 2,000 tons in June 1943, to more than 70,000 tons in July 1945. By Aug. 1945, more than 400,000 tons had been delivered to airfields in China, some of which had been constructed of stone broken, carried, and laid by hand, by thousands of Chinese.

The road and air transport projects, while in themselves major logistic accomplishments, necessitated a supporting project of great proportions. Eastern terminals were in Assam and East Bengal, and materials for China and for support of construction and operating forces, in

addition to materials for combat forces, had to be transported to the terminals from Calcutta some 700 mi. away. A rail route was reconstructed and augmented, and U.S. personnel were provided for operation. Two large pipe lines were extended from the Calcutta area to supply the great quantities of gasoline required. A U.S. barge line was inaugurated, and the port of Calcutta was reconstructed and expanded until its rate of discharge exceeded that of any overseas port.

Air supply played a major role in the support of combat operations in Burma. Up to 100,000 troops involved in fighting were at times mainly or entirely dependent on food, equipment and ammunition supplied by air. At critical stages of the operations, large forces were moved to threatened points by air. Two full Chinese divisions, urgently required, were flown from China to Assam, re-equipped, and flown to the battle area all in eight days. Without air transportation and air supply, combat operations could not have been conducted successfully in north Burma.

Production.—The successful Allied prosecution of World War II was due in large part to the application of overwhelming quantities of munitions against the axis. The achievements of industry in the United States and United Kingdom reached incredible heights.

During the five-year period 1940–45, more than 54,000,000 deadweight tons of shipping, excluding vessels of the U.S. navy, were constructed in U.S. yards. In the same period British yards added about 11,000,000 deadweight tons. Allied shipping losses during the war aggregated over 36,000,000 deadweight tons, twice the losses sustained in World War I.

Amphibious operations required the construction in the U.S. of more than 4,000 large ocean-going landing ships and craft, and about 79,000 smaller landing craft. The British produced several thousands of varying types.

During the period July 1940–July 1945, the U.S. produced about 297,000 military aircraft, more than 86,000 tanks, 120,000 armoured vehicles and about 2,500,000 military trucks. In the period Sept. 1939–June 1944, Britain produced more than 102,000 aircraft, 25,000 tanks, 74,000 armoured vehicles and 919,000 military trucks.

The U.S. rendered lend-lease (*q.v.*) to its Allies during the war to the extent of about \$50,700,000,000. Similar British expenditures approximated \$6,500,000,000. (See also STRATEGY OF WORLD WAR II; STRATEGIC BOMBING; TACTICS OF WORLD WAR II; WAR PRODUCTION; WORLD WAR II).

London

London is the largest city in the world, the largest port, the largest industrial town in England and the capital city of an empire. Its vast spread, including the outer districts known as greater London, covered before World War II about 690 sq.mi. with a population which in the first three decades of the century had risen by sharp increases to about 9,000,000.

Anatomically, London consists of the City, the ancient heart of London, the county (comprising the 28 metropolitan boroughs) and greater London, once the metropolitan police area with a radius of 15 mi., now that of the London Passenger Transport board with a radius of 30 mi. Census figures show that the increase of population in recent decades was all in greater London, the county population having fallen slightly from the 4,500,000 reached in 1901, and the City resident population to 10,000.

This growth of greater London was mainly the result of the drift of people and industry to London in the years of depression which were less acutely felt in London than elsewhere. The Commission on the Distribution of Population (the Barlow report, 1937) called this a "problem demanding immediate attention" and recommended that no further industries be allowed to come to London. The Standing Conference on London Regional Planning (1937) noticed the acute transport problem and the traffic congestion produced by this vast population pivoted on a single centre for business, shopping and amusement and pointed out the "vicious circle by which transport facilities only serve to create new suburbs, which again create further demands on transport." The traffic problem was taken up in the Highway Development survey known as the Bressey report (1937), the main recommendations of which (ring roads with radial links, tunnels, widening and reorganization of main arteries and road junctions, great clearances at St. Paul's and other places lending themselves to spectacular treatment and reconsideration of railway bridges and of siting of stations) were a starting point for all subsequent plans for reconstruction.

Prewar London.—The London County council, re-elected in 1937 with an increased Labour majority, embarked upon a three years' plan for large-scale slum clearance, a new Thames tunnel, a new Waterloo bridge and improvement to the western road approaches. Powers were obtained to acquire land for the "green belt" (initiated by the London society in 1931) round the outer suburbs. By 1939, 8,000 people had been rehoused by the council, 26,000 by the boroughs; the fire brigade had new headquarters at Lambeth; John Rennie's Waterloo bridge, after much controversy, had been demolished and reconstruction had begun. The boroughs had built new town halls, at St. Pancras, Wandsworth, Hammersmith and Poplar. The University of London was installed in its new buildings; Church house, destined for an important secular role in the war, was begun. Trolley buses replaced trams over a large part of London's tramway system. All over London modern blocks were replacing old-fashioned property and some famous landmarks disappeared: Irving's theatre, the Lyceum, was closed; Daly's theatre and the old Alhambra in Leicester square gave place to cinemas; Adelphi terrace, a masterpiece of the Adam brothers, was replaced by a huge modern building. The Nash terraces in Regent's park, and the Royal Opera house, Covent garden, scheduled to be rebuilt, owed their lives to the war.

The first days of 1937 were those of a new reign. For the coronation (May 12) of King George VI and Queen Elizabeth, crowds vaster even than those which gathered for the

Jubilee (1935) witnessed a superb pageant of empire with contingents from India, the dominions and the crown colonies. In Westminster abbey the British Broadcasting corporation broadcast the ceremony with the most complicated relay hitherto attempted. During the entire month there was a bus strike, but Londoners were not disconcerted, finding in the greater freedom of the streets an enhancement of the holiday atmosphere.

The threat of war steadily grew. Between the Godesberg and the Munich agreements in 1938 mothers and children were evacuated, Londoners were fitted with gas masks and stoical, if also a trifle dismayed, Londoners watched gangs of navvies hurriedly digging shelter trenches in the parks, working far into the night by the sinister light of flares.

With the Munich agreement emergency measures ceased, to give place to more permanent preparations. A "lord mayor's fund," London's traditional mode of collective sympathy, was opened in aid of the Czechs. Upon the occupation of Prague in March 1939, the inevitable was accepted and volunteers besieged centres for every branch of civil defense. The first "Anderson" shelters to be deliv-

Guards' chapel, London, after being hit by a robot bomb in one of the attacks begun by the Germans in June 1944. The bomb struck during Sunday services, killing many of the guards

ered arrived in Islington in March and there was much discussion of the "Finsbury scheme" for deep shelters which were rejected as too expensive to construct and likely to be dangerous of access.

There were, at the same time, other troubles: fascists clashed with communists despite the prohibition (1937) of unofficial uniforms and of provocative demonstrations, and friends of the Irish republican army (I.R.A.) put explosives in letter boxes and railway luggage offices. Between Jan. and July 1939 there were 57 such outrages.

The summer of 1939 maintained some show of normality; the London County Council celebrated its jubilee, King George and Queen Elizabeth were greeted with enormous enthusiasm on their return to the capital after their transatlantic tour and held their customary summer functions. But the usual summer visits of foreign musicians and opera companies were cancelled at short notice. From Aug. 24, with the signature in Berlin of the Russian-German pact by Vyacheslav M. Molotov and Joachim von Ribbentrop, all hope of peace was a thing of the past. On Sept. 3 Britain was at war.

War.—The prime minister's broadcast on Sept. 3 was followed immediately by London's first siren—a mistake, but a useful exercise. Air attack was expected; gas masks were compulsorily carried and the black-out was imposed. In three days 54,000 mothers with 100,000 small children and 250,000 school children were evacuated in an atmosphere which the children's high spirits turned into a gigantic picnic. Businesses and sections of government departments left London; art treasures had been in process of removal since July. Entertainments and meetings were banned. Windows were stuck with netting and paper strips to prevent splintering; blast screens, shelters and sandbags appeared everywhere; barbed wire crept round government premises; balloons floated overhead, silvery by day, their tackle and impedimenta filling parks and squares; garages and schools became air raid precaution and Red Cross posts or fire stations.

As time passed without air attack, evacuees drifted back; theatres and concerts were resumed up to 10 P.M. (an alteration which outlived the war). The lunch hour concerts at the National gallery became a wartime attraction. By Christmas, since the only casualties to Londoners had been caused by collisions in the black-out with shelters, sandbags, street standards, pillar boxes and one another, a modicum of street lighting was conceded. In Jan. 1940 heavy falls of snow were added to the encumbrances in the streets; in that month the Thames froze, for the first time since 1814.

From the fall of France in June 1940 London, with spirits keyed to action after the long, strange delay, found itself in the front line. Throughout the port, dock hands were eager volunteers and craft were promptly manned for the urgent rescues of the Dunkirk beaches. It was the first time since the 17th century that sprit-sail barges had gone to war. There was fresh evacuation, and emergency defenses against invasion were hastily contrived; concrete blockhouses at strategic points were ingeniously camouflaged so as to be scarcely visible (notably the "bookstall" in Parliament square and in Trafalgar square the "information bureau" at the pedestal of Charles I's statue). Four relief bridges of timber were flung across the Thames. Fixed bayonets greeted visitors to government premises and the BBC.

On June 24 the London sirens sounded their first authentic warning, but there were no bombs. On Aug. 8

the battle of Britain began, its decisive significance scarcely guessed by Londoners as they stood enthralled to watch the frequent dogfights overhead. Aug. 15–18 constituted a climax, with a heavy daylight attack on Croydon and the airfields nearest to London, after which there was a pause. From Aug. 26, though the wider attack continued, London became the main target, with the twofold intention to terrorize Londoners and paralyze business and communications.

Air Battle of London.—For a fortnight from Aug. 26 night raids were sporadic only and confined to the outer suburbs. On Sept. 7 the battle of London began when 375 aircraft penetrated the defenses of the estuary by daylight (three previous attempts had been turned back by the royal air force), dropping bombs over a vast area from Woolwich to Tower bridge and beyond, setting wharves and warehouses ablaze, notably London docks and Surrey docks, where the fires—wheat, oil, rubber and tea—were quickly beyond the control of the fire service. The sinister glare lighted up the target conveniently for a further force of 250 bombers which rained down bombs from 8 P.M. till the small hours.

The German losses were considerable, but in that day and night more than 500 Londoners were killed, 1,500 seriously injured, thousands rendered homeless, transport and communications were out of action and whole districts in east London and the docks were reduced to smoking rubble.

From Sept. 11 the anti-aircraft barrage became more formidable, diminishing damage by disconcerting rather than hitting the Germans. There followed 57 consecutive nights of attack by forces averaging 200 bombers each night, with the sirens sounding each night regularly at dark and the "all clear" at 6 or 7 A.M. In the 100 days from Aug. 23 to Nov. 30 there were 368 alerts; Nov. 3 and 28 were the only raid-free nights.

Shelter life began in all its human drama and variety; late travellers on the tube railways found the shelterers either making merry or tucked up asleep. Bunks were soon installed, and medical, catering and sanitary facilities provided. Particularly celebrated for good organization and sociability were the West Ham mission, the Aldgate vaults, and the Aldwych tube which, closed to traffic, was utilized throughout its length during the whole war.

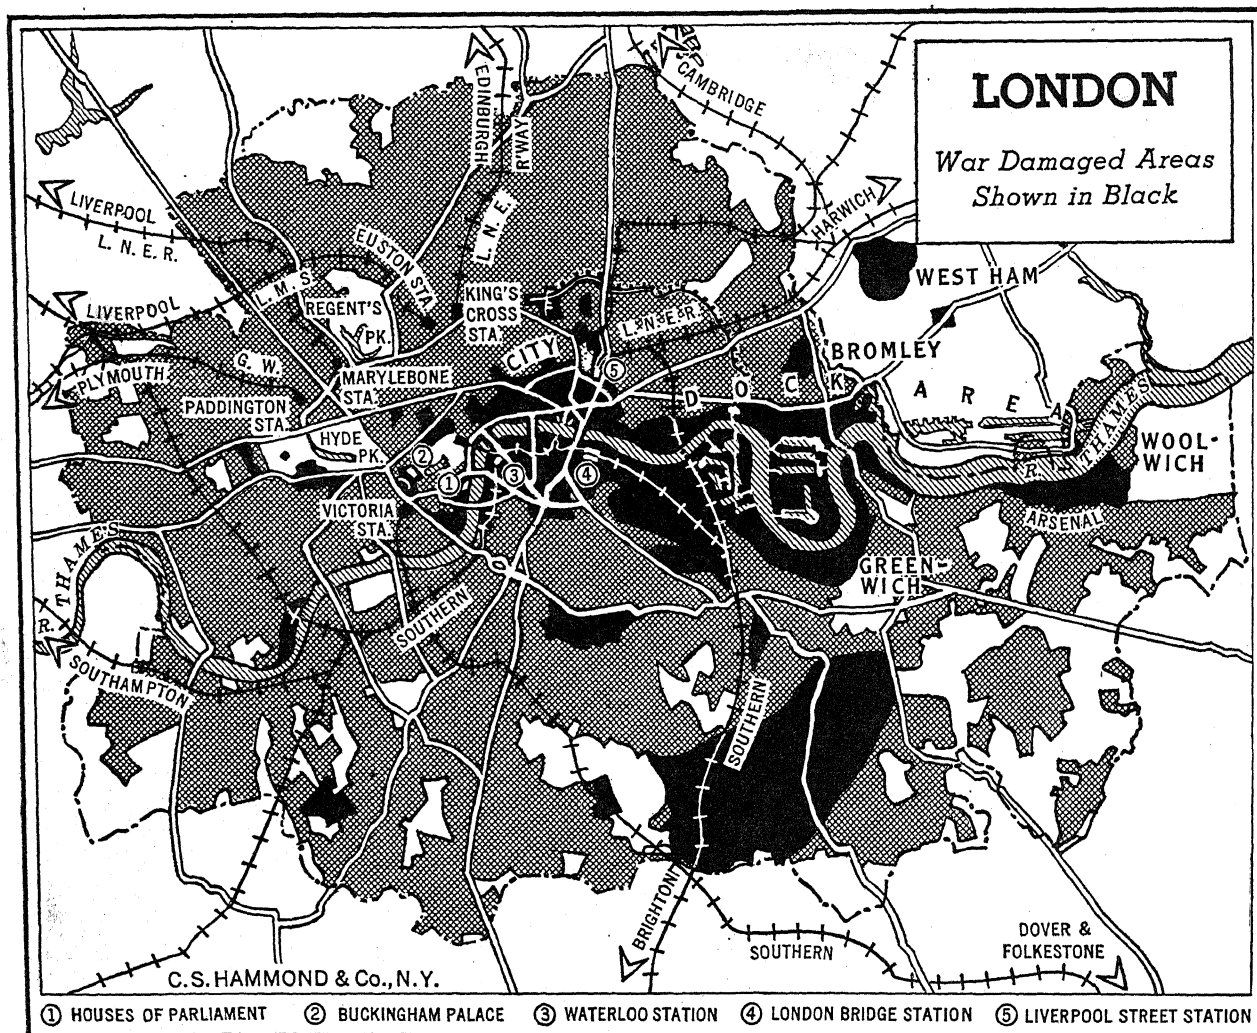

But though public shelters were fully occupied at night only 9% of Londoners made use of them; 27% had private shelters, "Anderson" or other, and the remaining 64% were on duty in some branch of civil defense, or remained at home under stairs, tables, grand pianos or just optimistically in bed.

From Sept. 15, the luftwaffe's greatest daylight defeat so far, the long-range bombers were withdrawn from daylight attack; and the protection afforded by the R.A.F. against the Messerschmitts which succeeded them was so efficacious that though sirens still sounded by daylight little notice was taken of them and life by day became almost normal in sharp contrast to the nights.

By the end of November, 13,000 Londoners had been killed, but pressure slackened as attention was paid elsewhere. If more intermittent, the raids were, however, no less severe; in the great incendiary attack on the City on Dec. 29 almost half of the area within the old City walls was destroyed, and a great area immediately outside. Among famous buildings destroyed or severely damaged

→
St. Paul's cathedral, clearly visible against a London night sky lighted by the fires of German incendiary bombs. The structure was severely damaged during the fierce raids of 1940–41

that night were the Guildhall, eight of the churches built by Sir Christopher Wren after the fire of 1666 (many more suffered in later raids) and three survivors of the 1666 fire: All Hallows, Barking-by-the-Tower, St. Olave's, Hart Street (associated with Samuel Pepys) and Austin Friars. St. Paul's cathedral, silhouetted in a sea of flames, was hit by high explosives but saved from the flames by the skill and heroism of its special band of fire watchers, professional architects.

Jan. 10 and 11 saw exceptionally heavy attacks, after which the Mansion house and the Bank of England stared at one another across a gigantic crater. There were 2 exceptionally severe attacks in March and 2 in April; in that of April 16, 450 tons of bombs came down killing more than 1,000 people. On May 10, a night of fire, the chamber of the house of commons was destroyed, the crossing of Westminster abbey fell in flames and the old canopies were burnt out. The tower, the law courts and the mint were hit, not for the first time, and there was widespread destruction.

May 10 brought the battle of London to a close. London was battered and dishevelled, but victorious. There were some slight further raids that year, the last on July 27, but nothing to worry a Londoner. In the 9 months' attack London had sustained more than half the casualties of the whole country; 1,150,000 houses were damaged, 375,000 people registered as homeless.

Respite.—From July 1941, for three years, apart from anxiety as to the general course of the war, London had

comparative peace. The house of commons sat for many months at Church house in Dean's yard till the lords gave it hospitality in their own chamber. There was a steady increase of entertainments and exhibitions, the National gallery showed each month a masterpiece temporarily drawn from its hiding place. In 1942 London was captured by its only invaders, the U.S. army, who transformed Mayfair to a 49th state, filled the streets, the parks, theatres and cinemas and rode in taxicabs to gaze in amazement at the ruins. The *Stars and Stripes* was published at the *Times* office.

Many shelters were closed, ruins were demolished, glass replaced some of the boards and calico in blasted windows. The new Waterloo bridge was opened to traffic; in the shortage of buses young people went to work and back on bicycles. Vegetables, pigs and chickens were raised on blitzed spaces and a miniature farm appeared at Cripple-gate where the remains of the Roman walls stood high above the ruins of more recent buildings. Everywhere ragwort, fleabane, fireweed and bracken crept decoratively over the ruins; mallards nested by a fire service lake in Bread street, redstarts in the ruins of the temple.

The call for munitions gathered in iron railings, to the detriment of public parks and lawns, and made every spare shed, cellar and yard a munitions dump, even the Guy Fawkes cellars of the houses of parliament. After what they had been through, Londoners viewed with dismay great fortresses being erected at the admiralty and close by the war office and strange erections rumoured to be the

entrances and ventilation shafts of new deep shelters.

In 1943 there were slight nuisance raids in one of which the Bethnal Green shelter disaster, the only one of its kind through the entire war, was caused by someone accidentally stumbling upon the entrance stairs.

In the first months of 1944 there was elation and profound security silence throughout the port of London, now a great invasion base where, among other preparations, 75% of the concreting of the "Mulberry" harbours was carried out. Blunt-nosed barges were moored at every pier in the river. In February some sharp raids, reprisals for R.A.F. attentions to Germany, did heavy damage at the treasury, St. James's palace, the London library and the adjacent district and sent casualties to 961 for the month. But spirits remained high; in April an unofficial bus strike in which buses were run by volunteers in service uniform who refrained from collecting fares merely increased the general mood of cheerfulness.

V-1 and V-2.—In May 1944 the blunt-nosed barges disappeared from the river; the Imperial conference met in London and on June 6 the Allies landed in Normandy. London with its scars and its long fortitude, was entitled to the full savour of the event; but a week later, on June 13, the first flying bomb ushered in nine months of intensive bombardment by V-1 and V-2 missiles. In the first fortnight 2,572 Londoners were killed and 400,000 houses destroyed; the unprecedented blast of a single V-1 could damage up to 1,500 houses in a built-up area. Particularly disastrous incidents occurred at the Guards' chapel, Wellington barracks, during Sunday morning service, and at Lewisham high street at the busy midday hour.

Evacuation began all over again; nearly 1,000,000 people—children, mothers with infants, the aged and infirm—were moved from London in the first six days, in conditions far worse than those of 1939, with flying bombs roaring overhead and frequent incidents. Shelter population rose in a few days to the figures of the autumn of 1940; in July the

new deep shelters with their superb organization for catering, etc., and 40,000 bunks were opened.

On Sept. 8 the first of the V-2 rockets fell, in Chiswick, their proportion to V-1s increasing as the Allies overran the V-1 launching sites in northern France. Unheralded by any siren or approaching sound, the V-2 was if possible more disagreeable than the V-1; but both had the merit that since they could not see there was no longer any point in the blackout, which was relaxed to a dimout from the end of February.

The last rocket fell on March 27, 1945, the last flying bomb on March 28; Gen. Patton had crossed the Rhine. Sheltering at night was relinquished. In the first days of May the end was in sight; on May 6 shelters were finally closed. There were bonfires all over London through the night of the 7th anticipating the announcement of the final surrender at Rheims made by the prime minister in the house of commons at 11 A.M. on the 8th, upon which the commons walked to St. Margaret's to give thanks, the lords to the abbey.

All day and night dense crowds surged through Trafalgar square, as always on great occasions, and round the palace calling for the king; and they pressed round Downing street acclaiming the prime minister, the one man who, nobody had the smallest doubt, had been the pivot upon which the world's fortunes had turned.

There was still the Japanese war, but London's war was over. Businesses and institutions began to return from evacuation and, not least of postwar problems, the evacuated families and school children, far too numerous for the surviving houses and schools.

Reconstruction.—Gradually, in 1946, large blocks and buildings were relinquished by the government; the University of London returned to its new buildings so long occupied by the ministry of information. The City turned a page in recovery when, in Sept. 1946, the wool sales, the most fundamentally traditional of all its commercial ac-

St. Paul's cathedral and neighbouring bomb-damaged areas in London as they appeared in April 1945

tivities, were held in the Wool exchange for the first time for six years. The port was handling more than half its prewar tonnage and was limited only by shortage of shipping. Postwar reaction from strain was evinced by labour unrest, strikes in the milk, meat and hotel trades; and people in search of accommodation invaded derequisitioned premises as squatters. Attempts to enforce closed-shop trade union membership were successful in the case of employees of the London Passenger Transport board, unsuccessful in the case of hospital staffs. By the spring of 1946 600,000 people had returned to the county area, 1,300,000 to greater London; and the flow continued.

Already in 1941 thoughts had turned to reconstruction, resulting in a number of plans: the Royal Academy plan (Dec. 1942), the County of London plan (1943), the City of London plan (1944, amended in 1946), the Greater London plan (1944) and the appointment of the Railway (London plan) committee (1944), which reported in 1946. The county plan proposed to limit the population of the county to 3,330,000, or 750,000 less than before the war, the surplus to be transferred to new towns under the greater London plan. The 28 metropolitan boroughs were to be regrouped into self-contained units of from 6,000 to 10,000 beginning with a £15,000,000 scheme for Stepney and Poplar. Certain districts, Westminster and the university area in Bloomsbury, were to be precincts closed to through traffic, the south bank of the river to be developed between Westminster and Waterloo bridges, additional road bridges to be constructed and Charing Cross railway bridge and station to be removed altogether.

The greater London plan divided the outer areas into four rings—an inner urban, a suburban, the "green belt," and a country ring containing a number of satellite towns complete with industries—to take the surplus population of the county, for the constitution of which powers were obtained in the New Towns act, 1946.

The Railway (London plan) committee's report (1946) recommended a number of new routes for traffic relief including new underground lines for passengers and freight to replace, as first priority, Blackfriars railway bridge and the disfiguring viaduct over Ludgate Hill close to St. Paul's. Further schemes were for new underground passenger lines linking the south bank with the City and the West End, and for the eventual removal of Cannon street railway bridge and station and an eventual reconsideration of Liverpool and Fenchurch street stations.

The City plan (1944), rejected by the ministry of town and country planning as leaving the railway stations and bridges too much to the discretion of the owners, had been amended by the Reconstruction of the City report (1946) which recommended a program to take 30 years in 3 stages and as a general objective the provision of more efficient but not greater business accommodation, with at the same time a road system providing for double the existing volume of traffic. Main features were the development of a St. Paul's precinct opening out from a new square at the junction of Queen Victoria street and Cannon street, which would also be the crossing of two great new thoroughfares, north and south, and east and west. Thames street would become an upper-level viaduct road from Blackfriars to the tower, the older through routes would be widened and a circuit of inner distributive roads formed for mixed traffic and for shopping. There would be a zoning treatment for different types of business, and the mar-

Trafalgar square, where thousands celebrated the first anniversary of victory in World War II on June 8, 1946. Londoners watched a huge parade in which troops from most Allied nations took part

kets, especially Billingsgate, would be reconsidered. The Railway committee's recommendations were recognized by the City authorities as of fundamental importance to reconstruction.

For the 20 severely bombed City churches the bishop of London's commission had recommended the reconstruction of 11, as having particular importance for the life or the ceremonial of the City; these included All Hallows, Barking-by-the-Tower (Toc H), St. Olave's, Hart street, St. Stephen's, Walbrook (the "lord mayor's church"), St. Bride's, Fleet street (the "newspapermen's church"), St. Mary-le-Bow (Bow bells), St. Michael-in-the-Royal (originally founded by Dick Whittington). The sites of the remainder would be sold or used for church halls or institutes.

Meantime, at the close of 1946 with the revival of trade and the restoration of the basic ration of gasoline, traffic congestion was a problem as pressing as in 1939; and in the much-blitzed City in central London, not one stone was raised upon another.

Los Angeles

Fourth largest city of the U.S.A., Los Angeles had a population of 1,805,687 by a special federal census of Jan. 1946. Area, 452.2 sq.mi. Frank L. Shaw was mayor until 1938; thereafter, Fletcher Bowron.

The centennial anniversary of the raising of the U.S. flag in Los Angeles was celebrated in 1946. The year 1946 also marked the close of the most progressive decade in the city's 100-year history. No other major U.S. city had experienced the phenomenal growth in population and industrial development achieved by Los Angeles in the decade 1937-46. In this ten-year period about 500,000 persons from other states took up their residence within the city limits. The 1937 figure was estimated to be 1,322,784.

The city remained the hub of a metropolitan area embracing 34 cities and unincorporated urban districts with an estimated population of 3,600,000, the third largest concentration of people in the nation. Greater Los Angeles had moved up from seventh place in industrial production in 1939 to second.

It had become the U.S. leader in agricultural wealth, Los Angeles county being the first agricultural county of all of the states of the union. Value of the country's agricultural products rose from \$92,576,352 in 1937 to \$201,614,735 in 1945.

Los Angeles, at the close of 1946, was the world's second largest assembler of automobiles and second largest U.S. producer of rubber tires and tubes. It ranked first in the manufacture of oil-well equipment.

Only New York city exceeded Los Angeles in the manufacture of wearing apparel, while in the creation and manufacture of sportswear, Los Angeles ranked first. From 1937 to 1946, garment manufacturing skyrocketed from a

\$45,000,000-a-year business to \$400,000,000 annually, with approximately 30,000 persons employed by 1,000 manufacturers.

Leading the nation in the production of aircraft and aircraft parts, Los Angeles was considered the centre of aircraft manufacture in the U.S., with the nation's largest plants for construction of planes. These plants had a production backlog of \$619,234,000 in Nov. 1946. The city served as one of the great terminals for transcontinental and transpacific air travel and regularly scheduled flights to Mexico, Central and South America and Alaska. Air passengers clearing the city in 1943 totalled 38,967. The figure leaped to 761,452 in 1945, representing more than 11% of the national air passenger total.

To keep pace with aviation activity, a city airport commission was created in 1940. Development of a municipal airport was begun in 1941, following passage of a \$3,500,000 bond issue. This appropriation was increased in 1945, when the people approved an additional \$12,500,000 bond issue. Although nation-wide shortage of critical building material delayed construction of permanent airport buildings at the Los Angeles airport, public necessity dictated a program of intermediate facilities. These were opened in Dec. 1946, when major air lines transferred their operations from previous locations to the city airport, making it the most important commercial airport in the western U.S.

When completed, the Los Angeles airport would include approximately 3.8 sq.mi., with 7,000-ft. runways that could be extended to 10,000 ft., if required.

Long known as the world centre of the motion-picture industry, Los Angeles, with its famous Hollywood, continued in the forefront during the decade. Motion-picture studios increased their studio investment \$15,000,000 in this period. Production budgets more than doubled from \$135,000,000 in 1937 to \$300,000,000 in 1946. Studio pay rolls jumped from \$86,000,000 in 1937 to \$195,000,000 in 1946, with approximately 31,000 employees.

The centre of the nation's radio broadcasting shifted more and more toward Los Angeles during the decade, primarily because of the availability of artists for radio programs.

By 1946, 90% of U.S. network radio programs were originating from Los Angeles studios. The same proximity to talent activated growth of a rapidly expanding television industry.

Los Angeles harbour, largest man-made harbour in the world, continued to be the busiest port on the Pacific coast. Municipally owned and operated, its facilities were improved during the war years, and an \$11,000,000 improvement program was under way during 1946. The largest commercial fishing port in the U.S. was located at San Pedro, a part of the city of Los Angeles. Its receipts from fish and fish products totalled \$28,000,000 for 1946. The Los Angeles harbour was also the second greatest oil-exporting port of the U.S. Total tonnage of all products handled through the port rose from 18,610,713 tons in 1937 to a wartime peak of 24,188,176 tons in 1945. Gross harbour revenue to the city for the fiscal year 1945-46 was \$4,166,975.

An \$83,000,000 steel plant near Los Angeles and a \$55,000,000 synthetic rubber industry within the city limits were built during the war years and contributed to the postwar industrial growth.

In 1937 the city had a total of 2,857 industrial plants employing 85,173 persons. At the end of 1946, following

Tower of light cast by 50 searchlights at the Memorial coliseum in Los Angeles during a victory celebration honouring Generals George S. Patton, Jr. and James Doolittle on June 9, 1945

the conversion from war production to peacetime manufacture, more than 8,000 industrial firms employed approximately 234,900 workers. Industrial expansion in Los Angeles was a healthy indication of further peacetime growth. Between 1941 and 1945 the capital investment in Los Angeles industry was increased by almost \$500,000,000, about one-third of it in new plants and two-thirds in the expansion of existing ones, most of which were privately financed.

U.S. department of internal revenue records showed that 12½% of the nation's new businesses after the end of World War II were started in the Los Angeles area. At war's end, 84,000 employers in the Los Angeles area were paying federal social security taxes. At the close of 1946, 123,000 employers were on the social security tax roll.

After 1937 the cost of electrical power to Los Angeles consumers was reduced 30% by the municipally owned and operated water and power department, giving the city the lowest average electrical rate of the ten largest cities in the U.S. The city's major water supply came from melting snows of the eastern Sierras and travelled a distance of 337 mi. from the Mono basin and Owens valley, utilizing 260 mi. of aqueduct and 77 mi. of natural waterways. In 1941 the \$220,000,000 metropolitan water aqueduct was completed, bringing to Los Angeles water from the Colorado river, which, combined with existing water facilities, ensured a water supply for the future needs of at least 10,000,000 persons and further industrial expansion. This water was pumped over mountain ranges with power generated at Boulder dam and was conditioned for domestic use by one of the largest water-softening plants in the

world. An eight-year program of additions and improvements for the city water and power systems was undertaken in 1946 at a total cost of \$124,000,000.

The unprecedented activity in construction and housing development immediately following the war caused Los Angeles to issue more building permits during the first eight months of 1946 than the combined total of the nine other largest cities in the western U.S. This was necessitated by a great increase in population caused by large numbers of industrial workers remaining in the area, the location of veterans and their families from other states, the general influx of persons from other areas and the industrial and commercial growth of the city. Building permits during the first 10½ months of 1946 totalled 47,927, with a combined value of \$206,547,696.

In 1939 the first slum-clearance project was instituted to provide low-cost housing for low-income families. In the following years, nine similar projects were completed at a total cost of \$15,202,233. These ten projects provided housing for 3,468 families previously living in substandard dwellings. In addition, 12,275 housing units were provided during the war for war workers and their families.

Mayor Fletcher Bowron assumed office in 1938 following a recall election, under the provisions of the city charter and state constitution. There followed a city-wide cleanup which included reorganization of police, fire, health, civil service and other city departments.

A revolutionary step in city planning was completed in 1946 with the adoption of a comprehensive zoning ordinance, which was the result of a charter amendment making Los Angeles the first major city in the U.S. with a master plan of future physical development. This comprehensive zoning ordinance had been considered as a model for many large cities. Los Angeles had previously held the distinction of being the first city in the U.S. to put into effect zoning restrictions.

The growth, development and expansion of Los Angeles during the automobile age accounted for the city's extensive limits. It had become a city of automobiles. The 1940 federal census gave Los Angeles a ratio of five automobiles to every four families. In 1940 the first link in a 613-mi. chain of planned freeways was dedicated. With the aid of state and federal funds, existing freeways were extended and new ones were planned. In 1946 the city had a total of 5,502 mi. of improved streets. Between 1937 and 1946, 569 mi. of streets were added. (F. Bow.)

Lothian, Marquess of

The 11th Marquess of Lothian (Philip Henry Kerr) (1882-1940), British diplomat, was born April 18, 1882, and was educated at the Oratory school, Birmingham, and New college, Oxford. He went to South Africa in 1905, serving in various capacities for the government until 1908, when he became editor of *The State*, a South African publication. He returned to London in 1909 and became editor of the *Round Table* the next year, holding the post until 1916, when he became secretary to Lloyd George, then prime minister. He was made director of United Newspapers, Ltd., in 1921, chancellor of the Duchy of Lancaster in 1931 and parliamentary undersecretary for India

in the same year. In April 1939 he was appointed ambassador to the United States, in which post his principal duty was to obtain all possible assistance for the British in the way of ships, warplanes and munitions. His last speech, read by an associate the night before he died, was a plea for assistance and an assurance that the British, with U.S. help, could successfully combat the axis. He died in Washington, D.C., Dec. 12, 1940.

Louisiana

A west south central state of the United States, Louisiana was admitted to the union in 1812 as the 18th state; popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,177 sq.mi. are land. Population (1940) 2,363,880, of which 1,383,441 or 58.5% were rural and 980,439 or 41.5% urban; 64% native whites, 34.3% Negroes and 1.7% foreign born. On July 1, 1944, the population of the state was estimated at 2,535,385. Capital, Baton Rouge (34,719). Other important cities: New Orleans (494,537), Shreveport (98,167), Monroe (28,309), Alexandria (27,066), Lake Charles (21,207), Lafayette (19,210).

The general assembly did not meet in 1937, and no important constitutional changes were made. Notable progressive movements were: liberalization of the state's attitude toward industry, resulting in expenditure of \$50,000,000 in construction of new manufacturing establishments and expansion of existing ones; development of an elaborate social security program; improvement in transportation facilities; extension of the rural electrification system; enlargement of the soil-conservation program; and large expenditures on public improvements by the state and its municipalities. Principal state officers were Richard W. Leche, governor; Earl K. Long, lieutenant governor; E. A. Conway, secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; G. L. Porterie, attorney general; T. H. Harris, superintendent of education.

In 1938, the general assembly met in regular biennial session and passed 431 acts, including 28 proposed constitutional amendments which were ratified at the Nov. 1938 election. Most of the legislation was remedial in character, clarifying and liberalizing certain provisions of the existing code and statutes. More liberal provisions were made for expansion and maintenance of state-supported educational and charitable institutions and several additional trade schools were established. Perhaps the most important act passed was the Public Welfare Revenue act, levying a 1% sales tax for the support of the social security program.

On June 26, 1939, Governor R. W. Leche resigned and

State guardsmen were called out Oct. 9, 1943, in Louisiana to seat a sheriff in Plaquemines parish when the sheriff's foes denied the legality of his appointment. The guardsmen are shown here removing a highway barricade

was succeeded by Lieutenant Governor Earl K. Long, brother of the late Huey P. Long; and shortly thereafter a series of public scandals were revealed, involving the president and certain business officers of the state university, several building contractors and numerous politicians high in the councils of the state administration. The charges included diversion, misuse and embezzlement of public funds, forgery, use of the mails to defraud and other violations. Several of the malefactors were sentenced to state or federal prison terms.

These scandals provided the chief issue in the state Democratic primary of Jan. 16, 1940. In the hotly contested campaign, Governor Long led the administration machine forces, while the other four gubernatorial candidates ran upon reform platforms. The first primary was indecisive and a second was held on Feb. 20, 1940, in which Sam Houston Jones defeated Earl K. Long for governor and the Long machine which had dominated state politics for 12 years was overthrown. A comprehensive program of reform legislation was enacted, designed to eliminate political graft and corruption, ensure economy and efficiency in the public service and prevent any recurrence of political dictatorship or public scandal. The chief reform acts provided for a reorganized state administrative system, centralizing authority and responsibility in a few key officials and boards; a revised state fiscal system; the elimination of recognized abuses in the electoral system; a state civil service system to end political jobbery and ensure efficiency; a revised state tax structure, repealing the sales tax and increasing taxation on those citizens and corporations most able to bear it; the creation of a crime commission with power to deal with peculation in the handling of public funds; and the clarification of certain sections of the civil code and code of practice.

In 1941 the ousted Long faction attacked the constitutionality of much of the reform legislation enacted in 1940, and attempted to halt the investigation of political scandals. The state supreme court upheld some of the reform measures and invalidated others. The national defense program accounted for much of the construction work in the state in 1941. Existing army training camps were enlarged, several new ones were constructed, and new airfields were established. Industrial plants engaged in defense production were expanded, and additional ones were built. From August to October, 500,000 soldiers participated in elaborate military manoeuvres in Louisiana. Work was begun on an oil pipe line from Baton Rouge to the Atlantic seaboard, as a phase of the defense program.

In 1942, the legislature met in regular session on May 11. Because revenues had fallen below budget requests,

Governor Jones urged economy and recommended either drastic reductions in appropriations or new taxes to raise additional funds. The legislature adjourned after passing an appropriation bill calling for expenditures greatly in excess of revenues, without enacting new tax measures. The governor thereupon vetoed enough items to balance the budget, and after much contention an extra session of the legislature was convened (Aug. 20-29) to provide additional revenues to meet the state's most pressing financial needs, and pass a 1% "War Emergency Sales tax." The most important act passed during the regular session was the new Louisiana criminal code.

The new state civil service system went into operation

on Jan. 1, 1943, after the supreme court had upheld its constitutionality. A program of economy and efficiency in state affairs was continued, in spite of political opposition in the form of several court actions initiated to test the legality of certain reform statutes and administrative policies. The war effort brought increased industrial activity to the state in 1943, and housing facilities were greatly expanded near the chief industrial centres and the military training camps.

Two Democratic primaries were required in 1944, before conclusive majorities were obtained. The Democratic

nominees were formally elected on April 18, though nomination by that party is equivalent to election, and the "reform" wing of the party continued in power. The new state officers were James Houston Davis, governor; J. Emile Verret, lieutenant governor; Wade O. Martin, Jr., secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Fred S. LeBlanc, attorney general; John E. Cox, superintendent of education; Lucile May Grace, register of land office; Harry D. Wilson, commissioner of agriculture and immigration.

The 1944 regular session of the general assembly convened on May 8, and next day the new state officers were inaugurated for four-year terms. The only major administration measure rejected by the lawmakers was the proposed 1% sales tax designed to raise \$30,000,000 for postwar improvements. Appropriations for public education were substantially increased, and funds were provided for financing all state institutions and activities during the succeeding biennium. Minor changes were made in the state legal codes, and the civil service system was extended. There were 21 proposed constitutional amendments submitted to the electorate, 16 of which were approved at the general election in Nov. 1944. Roosevelt received 281,564 votes, Dewey 67,750.

A special session of the general assembly was held Oct. 11-21, 1945, to consider postwar problems. The session appropriated \$16,500,000 from the surplus fund to match anticipated federal grants for highways and drainage.

Mardi Gras enjoyed a spirited revival in New Orleans, La., in 1946; the annual festivities had been discontinued since 1941. Figures represent the demon and the king in a Zulu parade

The most important political event of 1946 was the defeat of Robert S. Maestri for re-election as mayor of New Orleans, thus retiring the last prominent leader of the old Huey P. Long political machine. (W. Pr.; X.)

Love, Nancy Harkness

Mrs. Love (1914–), U.S. aviatrix, was born Feb. 14, 1914, in Houghton, Mich. She learned to fly when she was 16 years old, and while a student at Vassar from 1931 to 1934 she qualified for a commercial pilot's licence. An air-marking pilot for the U.S. bureau of air commerce from 1935 to 1937, she later became a test pilot, and in 1941 she joined her husband's aviation company as sales director. In 1942 it was decided to establish a unit of women fliers to ferry army planes from factories to airfields, thus relieving male pilots for other duties. The unit, known as the Women's Auxiliary Ferrying Squadron (WAFS), was put under command of Mrs. Love. During the summer of 1943 the WAFS was incorporated in the Women's Airforce Service Pilots (WASP).

Lowden, Frank Orren

Lowden (1861–1943), U.S. politician, was born Jan. 26, 1861, at Sunrise City, Minn. Graduated from Iowa State university in 1885, he later practiced law and entered national politics, serving in congress from 1906 to 1911. He was governor of Illinois from 1917 to 1921. Known as a "favourite son" in midwest Republican circles, he was regarded as the outstanding G.O.P. candidate for president at the Chicago convention in 1920, but lost to Warren G. Harding, a "dark horse" after an 11th hour switch in votes. He declined the nomination as vice-president and running mate to Calvin Coolidge in 1924 and withdrew as Republican presidential candidate in 1928 when his farm plank for the party platform was rejected. He died in Tucson, Ariz., March 20, 1943.

Lozovsky, Solomon Abramovich

Lozovsky (pseudonym of A. S. Dridso), Russian politician (1878–), became an active revolutionary in 1900. After organizing Social-Democratic party clubs among railroad workers, he was arrested and sentenced to exile in Siberia in 1908, but escaped and lived abroad until the outbreak of the revolution in 1917. He then returned to the U.S.S.R. and devoted his energies to the organization of the Russian and the international trade union movements. In June 1939 Lozovsky was appointed vice-commissar for foreign affairs.

Luce, Clare Boothe

Mrs. Luce (1903–), U.S. playwright and politician, was born in New York city on April 10, 1903. She was graduated in 1917 from St. Mary's school at Garden City, Long Island, N.Y., and in 1919 from Miss Mason's Castle school at Tarrytown-on-the-Hudson. She was associate editor of *Vogue* in 1930, and associate editor and managing editor of *Vanity Fair* from 1930 to 1934. In 1935 she married Henry R. Luce, magazine publisher. Following a colourful campaign in the 4th district of Connecticut (Greenwich) in 1942, she was elected to the U.S. house of representatives on the Republican ticket. A member of the house military affairs committee and an outspoken critic of the Roosevelt administration, Mrs. Luce was at first op-

posed to American participation in World War II. Before the November elections of Nov. 1944, President Roosevelt personally called for her defeat, but she was re-elected to the house by a close margin. In Feb. 1946 she was converted to the Roman Catholic Church. Shortly thereafter she announced that she would not run for re-election to Congress. Mrs. Luce wrote *Stuffed Shirts* (1933) and *Europe in the Spring* (1940), and several plays, including *The Women* (1937), *Kiss the Boys Goodbye* (1938) and *Margin for Error* (1939).

Lumber

The U.S. lumber industry passed through several critical changes during the decade 1937–46, from a period of business depression and lack of demand to a period of extreme activity, strong demand, and many difficulties incident to the war years. Lumber production in 1937 was about 26,000,000,000 bd.ft. This was considerably above the low production of the depression years (about 10,000,000,000 bd.ft. in 1932) and still far below the maximum all-time production of about 45,000,000,000 bd.ft. in 1909. For several years following 1937, there was a gradual rise in lumber production until 1943, when about 34,000,000,000 bd.ft. were produced. During the years 1944–46, although the demand for lumber for war purposes was extremely urgent, production gradually decreased because of (1) difficulties in securing logging and sawmill equipment, particularly tires, trucks and sawmill parts, (2) scarcity and high cost of labour, particularly of the efficient and skilled types and (3) price ceilings imposed by the government.

The principal lumber species produced during the ten-year period continued substantially the same; that is, southern pine maintained its position as the leading kind of lumber produced, followed in order of importance by Douglas fir, as produced largely in Oregon and Washington, ponderosa pine, produced principally in Oregon, California and Idaho, followed by oak, white pine (including northern white pine and western or Idaho white pine), hemlock (including eastern and western varieties), spruce, sugar pine, redwood and cypress.

The leading hardwoods produced in order of importance were oak, red gum, yellow poplar, maple, tupelo gum, beech, cottonwood, birch, hickory and elm. Basswood, ash, sycamore and walnut were other important hardwoods produced. Important softwoods other than those mentioned above were larch, cedar (including western red, Port Orford and incense cedars), lodgepole pine and balsam fir. About 15% to 20% of the total lumber production consisted of hardwoods.

Lumber production was definitely curtailed by the imposition of price ceilings for logs, as well as for lumber as sold at the sawmills by the manufacturers and retailers of lumber. It was patently evident that lumber could not be produced in large and increasing volume to sell at some of the fixed ceiling prices, especially for certain items and therefore lumber production fell off rapidly. This condition was a natural result of increased wages (decreasing the margin between costs and sales returns), lack of labour caused by strikes, and inefficiency of labour, which became a widespread condition. During 1946, lumber stocks in the retail lumber yards were reduced to as low as 3% to 10% compared with the normal inventories. This accumulated shortage resulted in a serious housing situation.

Various official and expert viewpoints were expressed regarding methods of increasing lumber production both for

war requirements and for the urgent housing requirements after the end of the war in 1945. There was a large sawmill capacity, estimated at about 35,000 mills in the United States, and large supplies of standing timber were available. However, the available product of U.S. forests in the form of finished and seasoned lumber was insufficient to meet industrial requirements, as well as for dwelling construction.

Available timber supplies of the country at the end of the decade were estimated at about 1,162,000,000,000 bd.ft. of standing timber, mostly in the northwest, especially Douglas fir, west coast hemlock, ponderosa pine, several cedars, Sitka spruce, redwood, western white pine and the true firs. Although a large part of the standing timber was in the northwest, more lumber was produced in the eastern and southern states than in the western states. The southern pine forests, comprising about 40% of the total forest area of the country, were growing rapidly, and about 90% of the total lumber produced from southern pine came from second growth or regrowth.

Lumber prices did not reach the extremely high levels during the ten-year period that they did in 1920 following World War I, owing largely to price ceilings established by the OPA. For a typical year, 1943, the average price per 1,000 bd.ft. f.o.b. sawmills, of all lumber in various grades and sizes, was \$36.86. The average price of all softwoods, f.o.b. sawmills, was \$35.57 and the average price of hardwoods was \$41.57. The most valuable hardwood was walnut, followed in order of value by birch, maple, basswood, ash, yellow poplar and oak. Species of comparatively lower values were red gum, tupelo gum, cottonwood, chestnut, beech and alder. The highest value softwoods were, in order of value, Port Orford cedar, western red cedar, cypress, Sitka spruce, redwood and sugar pine. These were followed in value by northern white pine, ponderosa pine and southern pine. Still less valuable woods were Douglas fir, larch, Engelmann spruce, incense cedar and hemlock.

Sawmills cutting from 1,000,000 up to 50,000,000 bd.ft. or more per year produced a very large share of all lumber. The largest number of sawmills produced from 10,000 to 500,000 bd.ft. per year. However, some of the largest sawmills produced as much as 1,000,000 bd.ft. per day each, and the small mills produced only from 1,000 to about 10,000 bd.ft. per day. Many of the sawmills operated only a few days, weeks or months per year. In one year (1943) there were 36,000 active sawmills in the eastern states. Of these, 10,110 mills each cut less than 50,000 bd.ft. of lumber in one year, and altogether produced only 1% of all the lumber sawed in the eastern states. The very largest sawmills were located in Oregon with a few others of enormous daily and annual capacity in Washington, California and Idaho. The number of active mills in the western states was reported to be 2,757.

The U.S. Industry and War.—During the period 1941–45 inclusive, there was a preponderance of production for the war effort, especially for boxes and crates in which to ship enormous quantities of food, munitions and supplies, lumber for building purposes, aeroplanes, docks, barracks and structures of all kinds in army camps, shipping ports, and training centres and for repair work. Considerable lumber was shipped abroad for the army. About 60,000,000 bd.ft. were shipped to the port of Naples, Italy, alone for dock repairs. Because of war priorities, very little lumber was available for normal domestic uses.

Lumber was generally taken rough and green (unseasoned) from the sawmills, contrary to the normal and best recommended practices. Also, green lumber was often

planed without prior seasoning, which is also regarded as poor practice. This was a reflection of the extreme urgency of the demand for lumber.

Wages increased for both woods and sawmill labour. This condition was reflected in decreased efficiency and considerable unrest leading to strikes and shutdowns, often as a result of labour jurisdictional disputes. For example, woods labour under C.I.O. (Congress of Industrial Organizations) jurisdiction would sometimes refuse to furnish logs to sawmills which were organized under the A.F.L. (American Federation of Labor). There was an increasing use of labour-saving devices, a direct result of the demands for higher wages and the difficulty of securing efficient, adequately trained and sufficiently skilled labour.

A gradual reduction of normal sawmill output took place because of the labour scarcity, the difficulties in securing proper machinery and repair parts and especially sufficient tires and trucks for normal production. These conditions, combined with the ceiling prices of the Office of Price Administration, seriously curtailed lumber production until it reached a low of about 27,000,000,000 bd.ft. in 1945.

Lack of lumber for civilian housing or for normal industrial requirements continued. The curtailment of lumber for civilian purposes prevented normal housing construction, resulting in a serious shortage for housing returning veterans as well as for the normal population increases. Generally about 800,000 frame dwellings had been erected annually under normal conditions. For about five years, very little construction of this kind had been done. The result was a critical housing shortage.

The whole decade was also marked by a gradual reduction of the enormous wastage incident to converting round logs into lumber, especially in the form of sawdust, shavings, edgings, trimmings, etc. Many new methods were developed for using this material in the manufacture of pre-sto-logs for fuel, various plastics, fibreboards, wood flour, and materials for linoleum and other floor coverings. The reduction of sawmill waste was an outstanding accomplishment. Normally less than 50% of the trees felled during logging operations had been found in the final lumber product.

The period was also marked by a further development in more accurately finished sizes and precision planing in connection with grade and trade marking throughout the industry for better identification of grades, species and sawmills of origin.

Trends of the Industry.—During the decade, there were three significant changes in the economic structure of the lumber industry. There was, for example, a definite and changing attitude among lumber manufacturers to make a much more improved and attractive product for the ultimate consumer. This definitely resulted in close and more complete utilization of the enormous wastage incident to the conversion of round logs as found in U.S. forests to the finished sizes and forms used by the ultimate consumer. Large quantities of sawmill refuse formerly wasted were used for paper pulp, fibreboards, plastics and floor coverings.

At the same time, there was a very active, progressive and forward-looking program of forestry. Although lumbermen still owned a relatively small part of the remaining timber resources in this country, private owners, including lumbermen, farmers, railroads, miscellaneous corporations, pulp and paper companies, etc., owned or controlled about 80% of the total remaining areas of forests. The

organized lumbermen, through the American Forest Products industries, devoted considerable attention as well as funds to promote: (1) better and more adequate fire protection to assist in the regrowth of cut-over forests, as well as the protection of the existing stands; (2) the reforestation of many thousands of acres and the advocacy of planting by farmers, lumbermen and other private owners throughout the country; this revolved largely around their program entitled "Trees for America," also locally known as "Trees for Tomorrow"; (3) cutting the forests by silvicultural methods to assure the increased growth and productivity of trees remaining and the continuity of forest management. Thus the growing capacity of forests by a system known as selective logging was increased and stimulated, rather than impaired.

There was a growing feeling that the United States would need more of its resources for lumber, pulp and paper, and many other forest products and that exports to foreign countries should not be increased. If U.S. forests were properly protected and managed, it was believed that an adequate supply could be grown for all domestic requirements and perhaps in addition, a profitable export trade. However, the prospective demand for the postwar years appeared to be very large, to make up for the housing deficiency from 1941 to 1946. An exceedingly strong demand for all kinds of lumber was anticipated, not only for housing, but for industrial purposes, railroads, farm construction, and many other purposes for which lumber had been demonstrated to be the most useful material.

Mechanized Logging.—A notable development in the lumber industry during the latter years of the ten-year period was mechanized logging. The difficulty in securing sufficiently skilled labour combined with work stoppages during strikes caused the introduction and use of mechanical means of falling and crosscutting trees into log lengths as well as for skidding the logs to landings in the woods and hauling the logs to sawmills. The practical achievements in mechanized logging may be summarized as follows:

(1) Improved tractors for skidding logs from the felling areas in the woods to central loading points known as landings. During the war tractors were developed to a much greater state of efficiency and replaced horses, mules and oxen almost entirely in U.S. forests.

(2) Improved log loading devices. Formerly, logs were frequently rolled by hand from skidways onto trucks or railroad cars. Many improved devices using an A-frame or overhead cable and a small tractor for power were used to elevate logs from the landings onto motor trucks.

(3) The use of chain saws for falling trees and bucking them into log lengths. About ten different makes appeared on the market during 1937-46. After falling the trees in the woods, the long or tree lengths were skidded to a central landing or skidway, then cross cut into 10, 12, 14 and 16 ft. lengths in the east and south or to much longer lengths as commonly used on the west coast. These chain saws were developed for use in falling large timber up to 6 to 8 ft. in diameter on the west coast and smaller types for falling and bucking pulpwood as well as saw timber in Canada, the northeast and in the south.

(4) The use of trucks to haul logs to sawmills. Trucks replaced many other means of transporting logs from the woods to the sawmill, such as railroads and water transportation. By increasing the size and number of tires, large axles and brakes, logs were brought from the woods to the mills much more promptly and more cheaply than by other means. Some of these trucks were equipped with a power take-off so that the motor engine could be used to elevate the logs and draw them onto the trucks in addition to its ordinary use. (N. C. B.)

Great Britain, the Commonwealth and Europe.—The years 1937-46 showed a transition in the supply of timber from plenty to scarcity. In 1937, certain international

trade agreements were made with the object of relating production to demand and thus ensuring a fair return to the producers. In fact, the glut of timber caused the organization of European exporters, known as European Timber Exporters convention, to take steps to limit the quantity of European softwoods available for export, whereas in 1946 one of the main problems of reconstruction in Great Britain, the commonwealth and Europe, was a comparative shortage of timber at the places of consumption.

Position Before World War II.—The quantity of timber which the U.S.S.R. wished to export was an embarrassment to its neighbours. It did, however, become a party to the E.T.E.C. agreement. After several attempts to handle the Russian exports, the softwood importers of Great Britain in 1930 established the Central Softwood Buying Corporation, Ltd., and in 1932 established the Timber Distributors, Ltd., to negotiate on their behalf with exporters for the soviet union and the resultant purchases were divided among the individual importers. Production in the principal European hardwoods, viz., oak, ash and beech, was on the heavy side, but the importing markets were able to absorb it without any serious dislocation. A considerable overproduction in plywood took place, however, in the principal European exporting countries. This was assisted by the fact that the German government was subsidizing its industry so that German plywood was actually selling considerably cheaper in the importing countries than it was in Germany itself. In 1936, currency problems were already troubling many of the European countries with the result that limitation of timber imports by the means of quotas was set up in Germany, France, the Netherlands, Belgium, Spain, etc. Canada's export was divided between the U.S.A. and Great Britain and the far east. Canadian softwoods continued to show a steady increase among the import statistics of Great Britain.

Table I.—Timber Production in the British Commonwealth and Europe, 1938

Countries	Softwood	Hardwood	Plywood	Total
Canada	293,396,000 cu.ft.	20,617,000 cu.ft.	10,477,000 super ft.	
U.S.S.R.	10,000,000 standards (est.)		24,340,000 cu.ft. (1940)	8,208,000,000 cu.ft. (est.)
Central and Southern Europe	5,000,000 standards (est.)			
Sweden	1,450,000 standards			850,000,000 cu.ft. (est.)
Finland	1,300,000 standards of sawn goods			
Baltic States	1,000,000 standards (est.)			

World War II.—The outbreak of World War II changed the timber position overnight. The great exporting countries were cut off from all contacts with their principal buyers. Great Britain, the largest timber importing country, was forced to draw the whole of its supplies from the U.S.A., and from Canada and other parts of the commonwealth. Such exports as were still possible from Sweden and Finland went to Germany. Poland was mainly overrun by invading armies, and the soviet union ceased to export, using its timber production for internal purposes. Southeast Europe continued a small export trade to Great Britain for a few months, but this was cut off on the entrance of Italy into the war. On Sept. 1, 1939, the United Kingdom timber control was established and immediately produced a maximum price list for all timbers, including plywood; no consumer could obtain material without a licence, which was granted only for essential work. At the same time the government took over all existing forward contracts and the timber control became the sole buyer for Great Britain.

A timber control office was set up in Canada in 1940 to

control both internal prices and exports. A definite quota based on production was allocated to Great Britain and continued in operation throughout World War II. In addition, maximum prices were established by 1943. The timber controls of both Great Britain and Canada operated efficiently. The need for them was well appreciated by producers, merchants and consumers alike. In 1941, passage of the Lend-Lease act by congress introduced an additional factor into the timber operations of both Great Britain and Canada. The dollar reserve in Great Britain had by now fallen to such a low level that without this U.S. assistance it would have been virtually impossible for Great Britain to maintain the necessary imports of vital raw materials for its war effort. Contact between both the British and the Canadian timber controls was maintained through the agency of the lend-lease administration. After the victory in Europe this business was transferred to the Foreign Economic Administration. After the complete cessation of hostilities, the Office of International Trade in the U.S. took over the task. During World War II the actual operative body was the allocations committee of the War Production board.

On the cessation of hostilities, the demand for timber for reconstruction purposes in both Europe and Great Britain remained very large, while supplies were still short. A body known as the Allied working group was established with headquarters in London to apportion the available supplies equitably among the Allies, according to their needs.

In 1942, the German submarine campaign took such toll of Allied shipping that the amount of shipping for importing timber became seriously restricted. It became urgently necessary to increase British home-grown supplies and, in consequence, the home-grown timber production department of the ministry of supply was started. This department not only encouraged production by merchants to the fullest possible extent, but also operated mills of its own.

The quantity of timber saved in importation from 1939 to 1945 as a result of the home timber production was the equivalent of 19,600,000 short tons. The home timber industry bridged the gap in the timber supply situation. Whereas 95% of the prewar consumption of timber was imported, the consumption of home timber rose to a peak of 44% in softwoods and 80% in hardwoods during World War II.

Table II.—Timber Production in Great Britain, 1935-43
(United States tons)

	1935-38 average	1939	1940	1941	1942	1943
Hardwood . . .	168,000*	347,200†	555,520	733,600	1,148,000	1,401,120
Softwood . . .	201,600*	134,400†	497,280	785,120	964,320	901,600
Pitwood . . .	134,400*	504,000†	1,710,240	1,613,920	1,762,880	1,976,800

*Production in 1930.

†Estimated production at the beginning of World War II, expressed as an annual rate.

Canada, because of its position outside the immediate scene of the conflict and the fact that it possessed the bulk of the softwood reserves of the British empire, was able to supply the remainder of Great Britain's requirements. In 1944, estimated imports of Canadian wood included about 1,000,000,000 ft. of softwood lumber, 18,000,000 ft. of Sitka spruce of aircraft quality, 33,600 short tons of birch logs for aircraft veneer, 20,000,000 ft. of graded hardwoods, 80,000,000 ft. of Douglas fir plywood, 175,000,000 ft. of aircraft plywood and huge quantities of board made in the pulp and paper mills. In 1942 annual exports to Great Britain reached a figure between 15,000,000 and 20,000,000 ft.

Canadian production held largely to its previous scale. The logging and export of western hemlock tended to in-

crease as more experience was gained in the conditioning, both by air seasoning and kilning, of this useful timber. During World War II, large quantities of it were milled in the more northerly territories, from which it was exported under the name of Alaska pine. In regard to operations in eastern Canada, an attempt was set up to put the production of maritime spruce on a more satisfactory basis by introducing better grading methods. A committee of the maritime lumber bureau was in negotiation with British importers on this matter. The Canadian plywood industry made rapid strides and several new undertakings were started. There was a large demand from the British ministry of aircraft production for specially selected aero grade birch plywood for the aircraft industry. A large new mill was established in eastern Canada, principally for the manufacture of birch plywood.

The difficulty of obtaining hardwoods during the years 1940-45 induced a fresh investigation into the possibilities of using subsidiary timbers from the British colonies in West Africa. Several little known woods were introduced on the English market with good results,* notably ekhimi or dahoma (*piptadenia africana*), a heavy wood of a golden brown colour used for constructional purposes; danta (*cistanthera papaverifera*), a reddish wood of a mahogany nature from the Gold Coast, and idigbo (*terminalia ivorensis*), a medium weight wood with something of the texture of ash which was largely used for vehicle construction and similar purposes, were also introduced.

Postwar Position.—On the cessation of hostilities, an enormous demand for timber of all description arose for the purposes of reconstruction in both Europe and Great Britain. To plan the orderly distribution of the limited supplies available in a fair manner among consumer countries, the Allies set up the timber subcommittee of the emergency economic committee for Europe. The position was somewhat eased in that Sweden was able to resume exports to its old markets in Great Britain, the Netherlands, France, Belgium, etc. A substantial quantity of the Finnish wood production was taken by the U.S.S.R. for reparations, but at the same time Finland was able to resume exports to its old customers in a small way. The production of Rumania and Yugoslavia was either used for internal purposes or transferred to Russia. Czechoslovakia resumed production, most of which was required for internal purposes, but a small export was made to Great Britain. Poland did not resume its exports, and Estonia, Latvia and Lithuania, which were substantial prewar exporting countries, had been absorbed in the soviet union, whose timber production was apparently absorbed by internal consumption. Negotiations were, however, successfully concluded in 1946 to provide for a quantity of Russian softwoods to become available for export in exchange for manufactured goods.

A large proportion of the variation in prices during 1937-46 was due to a heavy increase in freight charges.

Table III.—Variation in Prices, 1938 and 1946
(United Kingdom import statistics of the board of trade)

	1938	1946 (approximate)
Hardwoods: hewn	3s.7d. per cu.ft.	5s.9d. per cu.ft.
sawn	3s.9d. per cu.ft.	8s.3d. per cu.ft.
Softwoods: sawn	£13.6s.0d. per standard	£38.15s.0d. per standard
planed	£15.8s.0d. per standard	£40.14s.0d. per standard
Plywood	6s.0d. per cu.ft.	15s.0d. per cu.ft.

In Canada early in 1946, the maximum price list for export goods was lifted, but Great Britain still had its quota allocation on long-term contracts; the Canadian govern-

ment maintained control of the domestic price level. The United Kingdom timber control remained in force in 1946, although there had been some modification of arrangements for the softwood trade, by which importers bought their stocks from the timber control at the ports. The government, however, still remained practically the sole buyer in all branches. Licensing was still extremely severe, timber being available only for essential purposes.

Research and Development.—The years 1937–46 were a period of extensive research and development in the scientific utilization of timber. Important advances were made in the promotion of new uses and the improvement of existing uses; the practical application of research also resulted in the exploitation, particularly for the common war effort, of inherent qualities of woods which were formerly untested. This was evident in the manufacture of plywood and veneers; constructional timber fabrication; kiln and electric drying and the stress-grading of timber.

The uses of synthetic resin glues were considerably extended in the manufacture of waterproof and heat-resisting plywood. The glue line became in fact stronger than the materials which it bound together. These glues were already in use before World War II, but the demands of the aircraft industry in particular greatly extended their uses, with results that could be applied for civilian purposes. The use of synthetic resin glues was not confined to their properties as an adhesive; wood was impregnated with the glue under pressure to form a strong, hard and durable material, widely used during World War II in aeroplane propellers, as well as for many other purposes, including special bolts and nuts, hinges, etc. Postwar uses included gear and pulley wheels, bearings, shuttles, bobbins, electrical insulators, etc. For many years scientists had endeavoured to find ways of reducing the shrinkage and swelling of timber caused by its inherent hygroscopicity. Important steps toward solving this problem were taken. Here again synthetic resins and also heat treatment were used. A considerable development took place in the fabrication of wood for use in the laminated construction of roofs to cover large areas without the disadvantage of intervening pillars.

The technique of the kiln drying of timber progressed steadily. Besides traditional methods of heat and steam, systems were devised for improving and speeding the drying of timber by chemical means, using urea. As a result of experiments in the United States, the Timber Development association inaugurated a series of experiments in Great Britain with fairly satisfactory results. Electricity was also used for the drying of timber; this process, known as the high frequency method, involved passing a powerful electric current through the wood, thus generating heat and so drying the wood. The object of all these experiments was to reduce the time taken to dry timber from a green state to that in which it would stand without shrinking and warping.

Another important advance was the development of stress-grading of timber, a method of grading by which every piece of timber with certain characteristics was known to come within a definite range of strength properties. It differed from the ordinary grading in that, with the latter, defects allowed were purely arbitrary and based largely on appearance. In the case of stress-grading thousands of official tests enabled scientists to correlate the visual characteristics of a piece of timber with its actual strength in use. By this means timber took its rightful place with steel, concrete, etc., as an engineering material.

The shortage of all classes of building materials once more drew attention to the value of timber as a housing material. Some notable advances in design were made. In this respect the use of prefabrication was brought into great prominence by the use of exterior grade plywood. As a result of experience achieved by aeroplane manufacturers in Great Britain, modern design houses were being built there in 1946. Prefabricated Swedish timber houses were also being erected by local authorities under the auspices of the ministry of health.

United Nations and F.A.O.—The Food and Agriculture organization of the United Nations was set up to cover agriculture, forestry, food and fisheries. The forestry division was divided into two groups, (1) forestry and (2) forest products and utilization. The method of administration planned was by a series of annual conferences of delegations from the various nations, which would reach decisions on policy, approve programs of work and issue general instructions. The function of the director of the forestry division, under the director general of the F.A.O., would be to carry out the instructions given by such annual conferences. One of the immediate tasks was to make a survey of many large forest areas which hitherto had been considered difficult of access owing to lack of transport facilities, etc. Modern practice would enable such forests to be utilized. In order to avoid the wholesale cutting of timber which had happened in many places in the past, it was intended to bring such new forests under management from the outset. It was estimated that the world's forest area covered some 8,000,000,000 ac., of which only 3,000,000,000 ac. were being used. (See also FORESTS.)

Lutherans

In 1946, the structural organization of the Lutheran Church in North America was practically the same as it was in 1937, but in relationships between the 17 independent bodies great progress was made toward one Lutheran Church organization in America. The National Lutheran council was founded in 1918 as an agency for co-operation in work in which all Lutherans recognized a joint responsibility. In 1944 a new constitution for the National Lutheran council was adopted by two-thirds of the Lutherans in the U.S., under which the forces of the participating bodies were so united as to make a solid working front in many major areas of service. In 1946, a parallel constitution was adopted for a council in Canada, to operate with greater freedom in matters of a national character.

In 1946, also, three of the larger bodies approved the undertaking for the preparation and publication of a common hymnal, to replace those hymnals which hitherto had strongly reflected the traditions of European hymnals. In the same connection preliminary steps were taken to prepare a liturgy for use in all Lutheran congregations.

In 1936, the total confirmed membership of the Lutheran churches in North America had been reported as 3,194,304, representing an estimated constituency of 8,000,000. In 1946, the confirmed membership was 3,877,657, representing an estimated constituency of 8,500,000. It was estimated, on the basis of census reports, that there were not less than 3,000,000 Lutherans in North America outside of reporting congregations.

In 1946, Lutherans in North America were supporting 23 theological seminaries, 65 colleges, 80 hospitals, 27 child-

caring agencies, 105 homes for the aged, and 41 area societies for the ministry of mercy. No notable additions in numbers were made to these institutions in the ten-year period, 1937 to 1946, but great expansion in facilities and service took place.

The great service to men and women in the armed forces during World War II, costing more than \$2,760,000, was projected to care for thousands of G.I.'s who had entered educational institutions, and to other thousands in hospitals for veterans. In 1946, these services to be continued for men and women from the armed forces required a budget of \$300,000.

When World War II broke out, the Lutheran churches in North America assumed the responsibility for the care of scores of "orphaned missions" in many countries—India, Africa, Syria, Palestine, New Guinea, Greece, China, Japan, Madagascar, Arabia. The churches in the U.S. contributed \$1,597,579 for this special service. It was recognized that no small part of this work would become a permanent responsibility for the churches.

As soon as channels were opened after the end of the war in Europe, the Lutherans in the U.S. began shipping food and clothing through the Lutheran World Relief, Inc. During 1945 and 1946, more than 3,535,253 lb. of used clothing was gathered and shipped to various countries for distribution as prescribed by the governments involved.

During the war period, the Lutheran churches in North America contributed for special causes more than \$15,000,000, of which \$12,000,000 was for war relief and reconstruction. The total benevolence contributions of these churches for the period 1936 to 1945 was \$98,814,712. The total benevolence contributions for 1946 were just four times those of 1936.

Half of the ten-year period brought disruption, chaos, and destruction for the Lutheran churches in Europe, especially in Germany, Norway, Finland, Denmark and the Baltic states. The church in Sweden was profoundly disturbed and distressed, and was so definitely isolated from the rest of the world that all communications with churches in Europe were impossible.

The census reports for 1939 on Lutheran membership in the church in Europe was given as 56,548,585, a large percentage of all Protestants in the world. In 1946, no estimate of this membership could be made with any assurance, because of losses by death, displacement of whole populations, destruction of property and disorder in organization. Nevertheless, the church withstood the destructive forces of war as no other institution did.

The years 1945 and 1946 were especially "eventful years" for the Lutheran Church in the world, because it was then that the Lutherans of the whole world restored communications and came together, through accredited representatives, for the formation of the Lutheran World federation, as the successor to the loosely organized association, known previously as the Lutheran World convention. The Lutheran World federation, with efficient organization, entered upon a gigantic program of world missions, education and social service, through which it determined to make a major contribution to the welfare and happiness of mankind and to permanent peace in the world.

In recognition of the total task of the whole Christian Church in the world, the Lutherans, in connection with the organization of the Lutheran World federation, took necessary steps also in 1945 and 1946 for participation in the World Council of Churches.

One of the most significant facts concerning the strength and character of the church became apparent in the missions to non-Christian countries. In those countries the

young churches had been dependent, from their beginning, upon foreign material support and upon the leadership of the missionaries. The significant fact is that when deprived of that support they stood the test of loyalty to their faith and devotion to the church to a degree that resembled the church in the days of the apostles. One of the most striking examples of such steadfastness was in the case of the church in Japan, where the church not only continued to function throughout the war, but was ready, at the end of the war, to become one of the greatest reconstruction forces in that country. Luxembourg

Luxembourg is an independent, sovereign grand duchy in Europe at the point where the frontiers of France, Belgium and Germany come together. Area, 999 sq.mi.; pop. (est. 1942) 301,000 (1935 census 296,913); chief city, Luxembourg (cap. 59,000) (1935 census, 57,740); language, Luxembourgian (idiomatic) and (officially) French and German; religion, 98% Roman Catholic. Ruler after 1919: Grand Duchess Charlotte (b. 1896).

Dupong Government.—In June, 1937, a new government headed by Pierre Dupong of the Catholic party and including for the first time two Socialist ministers, marked a turning-point in Luxembourg's internal policy, as its chief aim was to safeguard above all the social and material needs of all the working classes.

German poster burning in a Luxembourg town as the people welcomed the entrance of Allied troops and the end of German domination in the fall of 1944

When, in 1938, war seemed unavoidable, Foreign Minister Joseph Bech reaffirmed the maintenance of his country's policy of neutrality, based on the London treaty of 1867. The people of the grand duchy celebrated enthusiastically, on April 22, 1939, the centenary of their country's independence, which they felt threatened by Nazi Germany at that very moment. The nation's suspicions were not unjustified, since, on May 10, 1940, German troops invaded the country. During the fights on the southern fringe of Luxembourg, 45,000 Luxembourgers found refuge on the hospitable soil of France. The grand duchess and her government immediately left the country in order to defend Luxembourg's cause in the free world, and by this act the grand duchy entered the war on the side of the Allies as the "Baby Partner."

Occupation.—In spite of the Nazis' reiterated affirmations to respect the territorial integrity and the political independence of Luxembourg (repeated once more on the very day of the country's invasion by their troops), Hitler appointed the German Gustav Simon Gauleiter of Luxembourg, with the object of preparing the forthcoming annexation of the grand duchy to the Reich. The Gauleiter's drastic steps in that direction, hurting the loyalism of the Luxembourg people to their royal house and their innate love of their free country, as well as their traditional admiration for France, originated Luxembourg's stiff resistance to all ruthless and brutal measures. In the course of their unequal struggle against the Nazis, the Luxembourgers manifested their passionate will to independence, which had found expression in their century-old national song: "We Want to Remain What We Are!"

On Oct. 10, 1941, a census was to be taken, in which all adult Luxembourgers were to declare that they were of German racial origin and that their mother tongue was German. But, thanks to their spontaneous opposition, this census turned out a 98% failure and had to be cancelled.

On Aug. 30, 1942, the Gauleiter proclaimed the *de facto* annexation of Luxembourg to the Reich and ordered compulsory military service in the Wehrmacht for several classes of Luxembourg boys. By way of protest, the Luxembourgers, on Aug. 31, declared a general strike, the news of which startled the Allied world and roused great admiration in the free countries all over the world. The Gauleiter retaliated by declaring martial law, which lasted eight days, during the course of which 21 patriots were shot and many others sent to prisons and concentration camps. Deportations of whole Luxembourg families set in, which went on without interruption until the liberation of the country by the Allies.

Meanwhile, the grand duchess, who in Feb. 1941, had been heartily welcomed by President Roosevelt at the White House, and her government had become the spiritual leaders of Luxembourg's resistance to the Nazi aggressor and had succeeded in "putting the grand duchy on the map." They gathered the Luxembourg boys who had managed to escape from the Wehrmacht into a small unit which prepared to fight on the side of the Allies.

Freedom.—Luxembourg was liberated on Sept. 10, 1944, but its ordeals were not yet at an end. The country was to contribute its greatest share to the Allied cause during the Battle of the Ardennes (Dec. 1945–Jan. 1946), in which one-third of its territory was laid waste. The total cost of war for the grand duchy amounted approximately to 16,000,000,000 francs.

After the first parliamentary elections in 1945, Pierre Du-

pong formed a Government of Sacred Union, comprising four ministers belonging to the Christian Social party, two to the Labour party, one to the Groupement Patriotique et Démocratique and one to the Communist party.

Thanks to the generous help granted by the U.S. and Great Britain, Luxembourg gradually recovered after V-E day and started to reconstruct its devastated areas. The Belgian-Luxembourg Economic union founded in 1921 was re-established in 1944. A customs union with the kingdom of the Netherlands was also prepared.

The people of Luxembourg felt highly honoured, when Gen. George S. Patton, their great liberator, was buried in Luxembourg soil in the U.S. military cemetery at Hamm, and when Winston Churchill paid a visit to their country in July 1946.

Lynching

One of the most significant and encouraging developments in the American social scene during the decade 1937–46 was the progressive decline (except for the last years) of the lynching habit. An all-time low was recorded in 1945, with only a single crime of this character; in 1944, there were only two. The significance of these figures is seen more clearly when placed over against an annual average of 86 victims from 1882 (the first year of accurate records) to 1935 inclusive, 1892 being the peak year with 231 known mob victims.

After that year, many factors contributed to a slow but fairly steady reduction of this type of crime. For progress

in this respect during the decade 1937-46, however, it seemed fair to give major credit to the determined and picturesque anti-lynching campaign carried on by the Association of Southern Women for the Prevention of Lynching. Organized in Atlanta, Ga., in 1931, under the auspices of the (Southern) Commission on Interracial Cooperation, and led by a Texas woman, Mrs. Jessie D. Ames, this association grew rapidly. Soon it reached a membership of more than 40,000 of the south's leading women, representing no less than 85 national, regional and state organizations, religious, literary, civic and political. Every one of these 40,000 women pledged herself by personal signature to do all in her power to prevent mob violence and to create a public opinion that would not condone it for any reason whatever.

Impelled by a sense of obligation to repudiate utterly the claim that lynchings were necessary for the defense of womanhood, these women went zealously about their task in every way possible. They interviewed hosts of public officials, from governors down, and gained the co-operation of more than 1,000 of them. They delivered addresses and conducted programs before hundreds of organizations, and secured their official endorsement. They blanketed the south with anti-lynching posters and literature. In numerous threatening situations they intervened directly, appealing to officials for the protection and fair trial of persons accused. Statistics of lynching testified to the effectiveness of their work.

But, while giving due credit to the efforts of these women, recognition should be extended also to other agencies working to the same end. It should be remembered, for example, that for nearly 30 years, the National Association for the Advancement of Colored People had conducted a continuous anti-lynching campaign, often against hopeless odds. Year after year this organization sought to bring lynchers to the bar of local justice. Meantime it pressed steadily for the enactment of a federal anti-lynching law to strengthen the hand of the government in such cases, though unsuccessfully. These efforts were attended with a great deal of publicity which did much to build public opinion on the subject. The churches contributed greatly to the same end, through vigorous pulpit utterances and official resolutions. To be remembered also were the newspapers of the south, which for a number of years had been practically unanimous in opposition to mob violence.

In spite of these encouraging facts and trends, however, it was pointed out that the friends of law and order should not assume that the fight against lynching was won. Students of the situation recognized that no small measure of mob psychology still persisted in America, north and south, and that for some years to come vigilant efforts would be needed to hold it in check. (R. B. E.)

Lyons, Joseph Aloysius

Lyons (1879-1939), Australian statesman, was born of a poor Irish immigrant family in Stanley, Tasmania, on Sept. 15, 1879. His education was largely informal. After a period as a school teacher he was elected to the Tasmanian house of assembly in 1909, and was prime minister of Tasmania from 1923 to 1928. He became Australian postmaster-general and minister of public works in 1929. Lyons broke with his fellow ministers in Prime Minister James Scullin's labour cabinet in 1931 and founded the

United Australia party, a strong opposition group which swept Scullin from office. Lyons became prime minister in 1932. Probably the most noteworthy accomplishment of his three successive terms was his reorganization of Australian finances. Lyons visited the United States in 1935 and represented Australia at the coronation of King George VI in 1937. He died at Sydney on April 7, 1939.

Lyttelton, Oliver

Lyttelton (1893-), British government official, was educated at Eton and at Trinity college, Cambridge. During World War I he served as an officer with the grenadier guards and was awarded the military cross and the D.S.O. After the war he entered business, and became managing director of the giant British Metal corporation, Ltd. With the beginning of World War II, in Sept. 1939, he entered the ministry of supply as controller of nonferrous metals. In Oct. 1940 Winston Churchill appointed him president of the board of trade. In June 1941 he became a minister of state and a member of the war cabinet, and shortly thereafter Churchill established a precedent by sending him as British representative to the middle east, the first time in history that a full-ranking cabinet officer had been established in overseas headquarters. He was recalled in 1942 to assume the post of minister of production. To pool the production resources of the U.S. and Great Britain, he and War Production board Director Donald Nelson were named co-administrators of a combined production and resources board. In March 1945 Lyttelton accompanied a British delegation to a food parley in the U.S. He was re-elected to parliament, but the victory of the Labour party that month deprived him of his post in the cabinet.

McAfee, Mildred Helen

Miss McAfee (Mrs. Douglas Horton), (1900-), U.S. educator and naval officer, was born on May 12, 1900, in Parkville, Mo., and was graduated from Vassar in 1920. From 1923 to 1926 she taught economics and sociology at Tusculum college, Greeneville, Tenn., and in 1928 she received her master's degree at the University of Chicago. She served as dean of women at Centre college, Danville, Ky., from 1927 to 1932, and at Oberlin college from 1934 to 1936, when she was appointed president of Wellesley college. After the outbreak of World War II, she was named a member of the education advisory committee for the navy training program, working with naval personnel on plans for a women's reserve. When President Roosevelt signed the bill creating a women's naval reserve on July 30, 1942, Miss McAfee was chosen to head the WAVES (Women Appointed for Volunteer Emergency Service, the women's reserve of the navy) and she was sworn in on Aug. 3, 1942, with the rank of lieutenant commander. She subsequently rose to the rank of captain. In Aug. 1945 she married the Rev. Dr. Douglas Horton, and the following month she revealed her intention to resign as head of the WAVES in order to return to Wellesley.

Macao

See PORTUGUESE COLONIAL EMPIRE.

MacArthur, Douglas

MacArthur (1880-), U.S. army officer, was born Jan. 26, 1880, in Little Rock barracks, Ark., the son of Lt. Gen. Arthur MacArthur. Graduated from West Point in 1903, he was commissioned in the engineer corps.

During World War I he commanded the 84th infantry brigade and subsequently the 42nd (Rainbow) division, rising to the rank of brigadier general. He was appointed major general in 1925 (youngest of that rank in the U.S. army), and was advanced to full general in 1930. From 1928 to 1930 he commanded the Philippines department, and from 1930 to 1935 he was chief of staff of the U.S. army.

Gen. MacArthur became military adviser to the Philippine government in Oct. 1935, and reorganized the commonwealth's defense system. Although he retired on Dec. 31, 1937, Pres. Manuel Quezon retained him as head of all Filipino military and constabulary forces. In July 1941, MacArthur was placed in command of the combined U.S. and commonwealth forces in the Philippines. In Dec. 1941, following Japan's attack on the Philippines, he led Filipino and U.S. forces in the defense of the islands. Although heavily outnumbered in men and equipment, MacArthur slowed the Japanese advance but was forced to retire with his army into the Bataan peninsula, whose defense he had planned long in advance. He left the Philippines on Roosevelt's orders before the fall of Bataan and Corregidor and reached Australia on March 17, 1942, to assume command of the United Nations' armies in the Southwest Pacific. In the fall of 1942, MacArthur opened a campaign on New Guinea which was destined to bring that island under his control and pave the way for the successful Philippines campaign. After the conquest of Leyte in 1944 and of Luzon in 1945, he announced, on July 5, 1945, that the entire Philippines had been liberated. MacArthur, who had been made general of the army in Dec. 1944, was appointed commander of U.S. army forces in the Pacific in April 1945, and his command was extended to include Okinawa and the Ryukyus the following August.

Gen. Douglas MacArthur, aboard a flying fortress, personally directed the mass landing of Allied paratroopers behind the Japanese lines northwest of Lae Sept. 5, 1943. This surprise attack led to the capture of Lae

After Japan's surrender, Pres. Harry Truman appointed Gen. MacArthur supreme commander of Allied occupation forces for Japan. The general headed the Allied delegation that signed the Japanese surrender terms on Sept. 2, 1945. (See JAPAN.)

McCreery, Sir Richard Loudon

Sir Richard McCreery (1898—), British army officer, was born Feb. 1, 1898, and studied at Eton and the Royal Military college, Sandhurst. He joined the army in 1915 as a second lieutenant, served in France, was wounded in action and completed the war with the rank of full lieutenant. In the interval between the two world wars, he had a variety of command assignments and held the rank of colonel in 1937. He was with British forces in France during the early part of World War II and won the distinguished service order for his services in the Dunkirk campaign, June 1940. He was promoted to brigadier the following month. In Dec. 1940, he was assigned to command an armoured division.

In 1942 McCreery was appointed chief of staff to Gen. Harold Alexander, and participated in the planning of the El Alamein offensive. He was knighted and made a major general in 1943, and was later promoted to the rank of lieutenant general. In Aug. 1943, he was attached to the Allied 5th army as commander of the 10th corps and participated in the battle of Salerno and in succeeding engagements in the Italian campaign. In Nov. 1944, he was made commander of the British 8th army and held this post throughout the remainder of the war. In July 1945 the British 8th army was disbanded and Gen. McCreery was appointed commander of British occupation armies in Austria. He was transferred to command of British armies on the Rhine in March 1946

McGuigan, James Charles

Cardinal McGuigan (1894—), archbishop of Toronto, Canada, was born at Hunter river, Prince Edward Island, on Nov. 26, 1894. Ordained to the priesthood on May 26, 1918, he was named chancellor of Edmonton diocese in 1922, and vicar general of the see the following year. In 1927 he was named prothonotary apostolic and rector and president of the newly established St. Joseph's seminary. He later received a doctorate in canon law at the Catholic University of America, Washington, D.C. Consecrated archbishop of Regina on May 15, 1930, he served for four years, during which period he gained renown for his guidance in relieving distress among all classes and creeds of the population when Saskatchewan suffered one of its most severe droughts. Named archbishop of Toronto on Dec. 22, 1934, he was elevated to assistant at the pontifical throne and was awarded the title of Roman count by Pope Pius XII in 1943. He was created and proclaimed a cardinal at consistory on Feb. 18, 1946, and thus became the first native-born, English-speaking Canadian to be appointed a member of the Sacred college.

Machado y Morales, Gerardo

Machado (1871-1939), Cuban politician, was born on Sept. 29, 1871, in the province of Santa Clara, Cuba. He joined the island's separatist movement when he was a youth of 22 and was twice decorated for bravery in outbreaks that preceded the declaration of independence from Spain. After several years in private life he became inspector general of the Cuban army, and secretary of the interior in 1908. As leader of the Liberal party he was elected president in 1925 for a four-year term. By

adroit manipulation of the congress and the constitution, he first secured extension of the presidential term to six years, then effected his own re-election in 1928. Economic distress and growing unrest of the army led to his overthrow in Aug. 1933. His enemies accused him of wholesale political assassinations, and a trail of indictments followed him into exile in the United States and Europe. He was arrested in New York City at the request of the Cuban government in Nov. 1937, but the charges against him were dropped the next month. He died at Miami Beach, Fla., on March 29, 1939.

Machinery and Machine Tools

Production records set by the machine-tool industries of the United States and Great Britain during the 1937-46 decade had never been approached previously. Because of the demands of mechanized warfare, manufacture of machine tools and other production equipment in both countries was expanded tremendously. This was accomplished in a number of ways. Existing plants were enlarged, more workers were employed and trained in the necessary skills and facilities were used more hours each week. In many plants women workers performed operations formerly done only by men. More important, production of much-needed machine tools was aided in both nations by subcontracting to companies in other industries the manufacture of parts, subassemblies and even complete machines. Manufacturers of precision metal products, such as printing machinery, packaging machines, etc., who had the necessary equipment and skilled workers and whose normal products were not needed for waging war, helped multiply machine-tool production.

In normal times the machine-tool industry had been surprisingly small in both the United States and Great Britain. Prior to outbreak of World War II, the U.S. machine-tool industry was made up of about 250 companies employing about 50,000 men. Before 1939 dollar volume of shipments from plants of U.S. machine-tool builders had exceeded \$200,000,000 only once—during World War I, when total shipments for 1918 were about \$220,600,000. In the depression year of 1932 production in the United States fell off to \$22,000,000—less than any other year since 1908.

Shipments of machine tools from plants of U.S. builders during the decade 1937-46 totalled more than \$5,484,000,000, as compared with the total of \$862,000,000 for the preceding decade. These two decades (see Table I) in-

tions were included. Not included were the other metal-forming machines, such as presses, forging machines and hammers, extruding machines, brakes and shears, for which comparable totals were not available.

Production of machine tools in the United States during the decade was more than 6 times that of the preceding decade (Table I), and was more than 67% of the \$8,128,400,000 total estimated shipments for the first 46 years of the 20th century. Shipments for the 5 war years 1941-45, when U.S. production was highest, totalled \$4,179,300,000, or more than 6 times the production total of \$669,200,000 for the World War I years 1914-18. And they were almost 18 times the total of \$233,000,000 for the 5 depression years 1931-35.

By the middle of 1941 production of machine tools in the United States was more than 1,000 units for each working day. Peak total was 307,186 units shipped in 1942 (Table II). During the 3½ years from Jan. 1, 1942, to

Table II.—Number of Machine Tools Shipped in the United States

Types	Total 1942 Ship- ments	Total 1943 Ship- ments	Total 1944 Ship- ments	Jan.-June 1945 Ship- ments	Total
Boring	9,697	7,278	3,070	1,702	21,747
Broaching	1,007	802	416	246	2,471
Drilling	47,654	41,581	21,944	10,432	121,611

June 30, 1945, U.S. machine-tool builders shipped more than 770,000 units. While large numbers of these machines were exported, machine tools in place in U.S. plants increased from slightly more than 1,000,000 in 1940 (Table III) to more than 1,711,000 units in 1945.

Table III.—Machine Tools in Place in United States Plants

Year	Total Tools In Place	Number Over 10 Years Old	Per Cent Over 10 Years Old
1930	1,127,310	554,562	49
1935	1,068,923	709,074	66
1940	1,000,112	723,947	72
1945	1,711,137	652,185	38

Note: Includes items identified as "machine tools" under the definition of "nonportable power-operated machine tools, valued at more than \$350 each, which shape metal products by progressively removing metal in the form of chips." Excludes such nontool items as shears, riveting machines, swaging machines, bending machines, forging machines and presses.

At its peak, the German machine-tool industry was reported to have made between 30,000 and 40,000 units annually, and Germany by the end of World War II was said to have had more than 1,000,000 machine tools to support its war machine. Some of these, of course, were stripped from plants in occupied areas. The U.S.S.R. alone was reported to have lost about 174,000 machine tools destroyed or stolen by the nazis.

Japan had about 150,000 machine tools in 1930. This was increased to about 1,000,000 units by the time World War II ended. The Japanese machine-tool industry was small, but from 1937 through 1940, the nation imported machine tools in considerable numbers from Great Britain, Germany and the United States. Japan bought about \$30,000,000 worth of power-driven metalworking machinery from the United States during 1937 and by 1939 was buying both new and used machine tools in large quantities.

According to the machinery division of the U.S. department of commerce, exports of power-driven metalworking machinery from the United States during 1938 totalled \$97,270,616, 62% more than the 1937 level. This was

Table I.—Machine-Tool Production in the United States

Year	Value	Year	Value
1927	\$87,000,000	1937	\$195,000,000
1928	128,000,000	1938	145,000,000
1929	185,000,000	1939	200,000,000
1930	96,000,000	1940	440,000,000
1931	51,000,000	1941	775,000,000
1932	22,000,000	1942	1,320,000,000
1933	25,000,000	1943	1,180,000,000
1934	50,000,000	1944	497,000,000
1935	85,000,000	1945	407,300,000
1936	133,000,000	1946 (Estimated)	325,448,000

cluded the depression year 1932, when shipments were only \$22,000,000, and the wartime peak years of 1942 and 1943, when shipments for the first time in the history of the industry were at the rate of more than \$1,000,000,000 annually. These totals were for nonportable power-operated machine tools, valued at more than \$350 each, shaping metal products by progressively removing metal in the form of chips. Machines for drilling, turning, boring, grinding, milling, threading, broaching and similar opera-

increased to \$112,571,552 in 1939 and to \$246,516,285 in 1940. Similar data were not available for later years, but it was estimated that about 18% of the dollar value of shipments from plants of U.S. machine-tool builders during World War II went for export, chiefly to Great Britain and the U.S.S.R.

Production methods, tools and equipment employed in the metalworking industry probably were given more critical examination during the decade than at any previous time. Vast quantities of war goods had to be made in the shortest possible time; materials had to be conserved and skilled production workers were at a premium. In addition, many of the war products had to be so accurately made that better machining methods were necessary to meet the finer dimensional tolerances demanded. Attention was directed to developments that increased the metal-removing capacity of machine tools, made them easier to operate and reduced the possibility of spoilage of the workpieces because of errors in judgment on the part of the operators. Skill had to be designed into the machines, and into the jigs and fixtures used with the machines, because untrained workers from many walks of life had to be taught almost overnight to use them efficiently.

Because much time was required to design and build special, high-production machine tools for individual products, standard general-purpose machine tools were employed wherever possible in armament plants. This gave the machine-tool industry an opportunity to make these machines in large quantities, with consequent reductions in time required per machine. In many instances general-purpose machine tools were adapted to mass production operations by equipping them with suitable auxiliary work locating and clamping devices arranged for automatic-cycle operation. In other cases, the design and construction of special machines were justified, by the increased production they made possible, or because they were needed to ensure manufacture of precision parts within tolerances almost impossible to achieve by other methods. Many such examples were to be found in the aircraft engine industry and in plants making ultra-precise navigation instruments.

Perhaps the high point in special machines developed during World War II for mass production of needed parts was the construction of several similar automatic transfer machines for milling, drilling, countersinking, reaming and tapping aluminum cylinder heads for radial aircraft engines. One of these machines replaced 40 general-purpose machine tools. It was made in two sections. The first had 16 stations where 25 separate operations were performed with 64 tools; the second had 53 stations where 46 operations were performed with 70 tools. A completed cylinder head was delivered every two minutes. Electric lights at a control desk indicated completion of each individual operation performed by the machine, or informed the operator when something was out of order at any station. After World War II, a similar transfer-type machine was built to machine refrigerator-compressor bodies at the rate of 188 per hr. Two workpieces on each fixture were moved successively to 24 stations so that 31 different operations could be performed. A total of 152 cutting tools was used.

Broaching, as a metal-removing operation, found increasing application throughout the metalworking industry during 1937-46. Some of the broaching machines were of huge size, particularly those constructed just prior to World War II for surface-broaching cylinder blocks for automobile engines and for spline-broaching gears. An important

development was the internal broaching of a rough-cast cored hole, without the broach following the out-of-line conditions of the hole. Another was the introduction of circular broaching, by means of which circular key slots and similar surfaces could be cut in a single pass of the tool.

One of the difficult, time-consuming operations in gun manufacture had been cutting of rifling grooves. Considerable attention was given this operation during World War II, with notable success in reducing the time required and in increasing the accuracy with which the grooves could be cut. Prior to about 1941, rifle and gun barrels were rifled with hook tools, one groove being cut at a time in a series of multiple passes. Analysis showed that pull broaches could be used to cut all of the grooves at one time in rifle and gun barrels in the calibre 0.30-37-mm. size range. The process was much the same as that used for cutting internal splines. For the calibre 0.30-0.550 gun barrels, an automatic multiple-station machine was developed to use a set of 5 broaches. Barrels were chucked in a horizontal drum, which was indexed automatically from the loading position successively to each of five broaching positions. Burrs at the edges of the rifling lands were removed by having the last three or four teeth of the final broach scrape the lands or bore of the barrel. Handling of the five broaches was automatic; the operator had only to place and remove the barrels from the indexing drum.

For the 20-mm. cannon barrel, 1 company developed a horizontal hydraulic-broaching machine with which a set of 4 solid helical broaches was used to complete the rifling at an average rate of about 10 min. per barrel. Another company developed an 8-station indexing machine with which 37-mm. antitank gun barrels were rifled complete with 7 broaches at the rate of 1 every 3 min.

Guns of larger calibre, ranging from 37-mm. to 6 in., usually were rifled by push broaching, using flat disks that were pushed through the gun bore successively on horizontal machines. Sometimes 30 or more such disks were used to complete the grooves in the bore of each gun. But all grooves were cut simultaneously, and the time saved was appreciable as compared with the older method requiring 30 or more passes in each groove with a hook tool.

Broaching also found other applications in the manufacture of rifle and gun parts. Such parts as triggers, trigger guards, sight bases, etc., were surface-broached economically. Formerly these parts required expensive operations involving a number of setups on milling and profiling machines.

An outstanding application of surface broaching during World War II was in the machining of spindle blades for several sizes of marine turbines. In one plant 66 different blades were required for the 3 sizes of turbines manufactured. These blades were made from specially heat-treated, corrosion-resistant stainless-steel bars having a hardness of about 200-240 Brinell. Formerly the blades were made in a series of form-milling operations; by using surface broaching, expenditure for costly milling fixtures was reduced materially, and time required to machine a set of blades was slashed. A special rotary-broaching machine finished the dovetail slots in each blade to ensure a tight fit on the turbine spindle.

Throughout the 1937-46 decade, machine-tool designers and production engineers paid increasing attention to the problem of producing smooth machined surfaces of high accuracy. Several methods for measuring and evaluating the quality of machined surfaces were developed, as were a number of novel methods for producing those finishes on

a variety of parts. Outstanding was the development and adoption of the crusher method of dressing abrasive wheels for thread and form grinders. Several manufacturers of grinding machines developed units incorporating this method of wheel dressing, including the maker of a new centreless thread grinder. This machine used a grinding wheel carrying multiple thread profiles formed by a cylindrical crusher roll with grooves in its periphery. The crusher was made of hardened steel and was rolled against the periphery of the grinding wheel with sufficient force to break down the bond of the abrasive, leaving the desired profile on the peripheral surface of the wheel. This machine ground accurate, smooth threads in hardened steel, set screw blanks in a single operation. Workpieces were fed between the grinding wheel and the regulating wheel one after another, as in a conventional cylindrical centreless grinder. Feed could be by hand or by means of an automatic loader.

The crusher method of dressing grinding wheels found an increasing field of application in the form of the grinding of longitudinal surfaces with a surface grinder. During 1945 one manufacturer announced development of an electrically powered crush-dressing device suitable for application to new or old machines. These power-dressing devices had several advantages over manual crush dressing, including reduction of wheel-dressing time by as much as 50% and increased life of the crusher roll resulting from the uniformity of crushing and smoothness of infeed. More parts were claimed per dressing because the wheel was always formed under identical conditions of infeed and pressure.

The decade also witnessed development of a process for producing an extremely fine finish on flat, internal, external, round, concave, convex and other surfaces. Known as the "superfinishing" process, it achieved its results by a combination of short motions, light abrasive pressures, slow abrasive cutting speeds, hard abrasive stones and a lubricant of carefully selected viscosity. At first glance, this process appeared to differ in no material detail from honing, similar stones—generally under spring pressure—being used. There were, however, several characteristic differences. The abrasive stones were applied against the work with extremely light pressures and moved in several different directions, only one of which was in the direction of marks produced by the cutting tools with which the preceding operation was performed.

The honing process, too, was improved to the point where stock removal could be controlled by selection of proper abrasive stones and operation conditions. In 1946 honing could be used to remove 25–30 times as much metal as ever before was practical with this process. In the manufacture of a steel cylinder barrel for an aircraft engine, 0.044 in. of stock was removed from the bore in 3.75 min. of processing time, using 3 honing operations. No grinding operation was necessary before honing.

A particularly interesting development in the surface-finishing field during the decade was that of an external horizontal hydraulic-honing machine having capacity for bars up to 5 in. diameter and up to 30 ft. long. In this machine, the work rotated and reciprocated through the hone head, mounted in a fixed position near the centre of the long main bed. Rotation of the work could be stopped while reciprocation was continued, in order to obtain "straight-line" honing, should this be desired.

A number of important developments took place in the gear-cutting and finishing field. Among these were the de-

sign and manufacture of a number of machines for finishing gear teeth by the "shaving" process, in which the cut gear was meshed with a serrated cutter and rotated for a predetermined length of time. The serrations in the teeth of the cutter removed thin shavings from the teeth of the gear, bringing them to correct size and shape. Another important development, particularly applicable in mass-production industries, was the announcement early in 1945 of a new method for rough and semifinish cutting the teeth in spur and helical gears up to 4 in. in diameter and 2 in. in face width. This vertical machine operated on the gear-shaper principle but employed an enveloping cutter head in which individual blades simultaneously cut each tooth of the gear. After each stroke of the cutter, an internal cone was adjusted automatically to move the blades inward a predetermined distance for the next cut. Such machines were used in conjunction with high-production gear-shaving machines.

The war years saw a tremendous increase in the use of cutting tools made with cemented carbide cutting tips. As a result, metal-removal rates for many turning, boring, drilling, reaming and milling operations were raised to new high levels. Carbide-tipped milling cutters having negative rake and helix angles made it possible to cut tough alloy steels at surface speeds of 400–600 ft. per minute, while mill steels were milled at up to 900 ft. per minute. With these speeds, feed rates of up to 60 in. per minute could be employed. Spectacular results were obtained when properly designed carbide-tipped milling cutters were used for cutting aluminum alloys in special aircraft wing spar millers. Here, cutting speeds of 10,000–20,000 ft. per minute, and feeds of up to 240 in. per minute were found satisfactory. Several years of milling cutter study along these lines resulted in the design of highly efficient tools suitable for the new high-power milling machines, as well as for use at lower speed and feed rates on older machines.

Spectacular results obtainable when milling with negative rake cutters led one ball-bearing manufacturer to experiment with the use of negative cutting rake angles on carbide-tipped single-point turning and boring tools. Surface speeds as high as 1,200 ft. per minute were tried, but 800 ft. per minute gave the best results when turning high-carbon, high-chrome alloy steel forgings. For boring, 615 ft. per minute was selected as the best cutting speed. Best feed was 0.015 in. per revolution. Rigid tool setup was essential. This application was unusual because of the very high speeds involved. But just as important were the higher-than-usual cutting speeds obtained throughout World War II when using carbide-tipped turning and boring tools for such varied operations as machining shell forgings, armour-plate castings for tanks and other armoured vehicles, gun tube forgings and castings and the many other steel parts on the army and navy ordnance procurement lists.

Drilling of holes with lengths many times their diameters had always been a difficult problem, particularly where high accuracies were necessary, as in drilling rifle and gun tubes. Drills had to be designed to permit delivery of a coolant or cutting fluid to the cutting edges, both to lubricate the drill point and to wash the chips back through the drilled hole as cutting progressed. With steel cutting edges, these drills usually had to be changed frequently since any dulling of the edges would cause the drill to "lead off" and produce an inaccurate hole. Gun drills with carbide tips and carbide wear plates, another wartime development of considerable importance, gave exceptionally high production rates because of fast per-

missible speeds and long life between regrinds. Standard drills as small as 0.293 and 0.300 in. in diameter were used for drilling rifle barrels and other ordnance parts made from steel up to 380 Brinell hardness and were run as long as 20 hr. between grinds. Compared with high-speed steel drills, feeds in some cases were doubled.

For many years the cemented carbides were used almost entirely for tipping cutting tools and for wire-drawing dies. Many other important applications were made. During World War II, shell-nosing dies and draw dies for brass and steel cartridge cases were made with carbide inserts. The high wear resistance and nongalling properties of the carbides gave such dies longer life and also helped conserve hard-to-obtain tungsten tool steels. Grinder work-rests, gauge elements, sleeve bearings for high-speed machine spindles, boring bars, knurling rolls and clamping device facings were among the other important uses for which these materials were found efficient. Young's modulus of elasticity for the cemented carbides was 2.4-3 times that of steel; so small-diameter carbide boring bars were stiffer than steel bars and they were used for precision boring holes without taper to greater depths than was possible previously. During World War II, approximately 12,000,000 heavy-gauge oil cans were seamed with a carbide roll. Steel rolls for the same operation were worn out after seaming 100,000 cans. There were several applications of carbide sleeve bearings on grinder spindles in which wear was not measurable after more than a year of use at high speeds. Ball bearings formerly used on the same spindles wore out in a week or two at the best.

Use of cemented carbides in punch press dies for piercing, blanking and forming operations were considered impractical until production requirements for war goods led to further trials. Not all applications in this field were successful, but others showed increases in die life of 10-100 times that of steel punches and dies. During World War II a company made radio-tube base parts from 0.0095-in.-thick stainless steel sheet having a hardness of 87 Rockwell B. Punching, drawing and trimming dies made of conventional steels needed redressing after every 50,000-60,000 parts. With cemented carbide inserts, a set of dies blanked, drew and trimmed more than 8,000,000 of these bases without stopping to rework the tools. Another company making radio tubes found use of cemented carbide die inserts so economical that by 1946 from 50% to 75% of the dies constructed included carbide parts. Most of them were used for work on 0.005-in. thick stock. In some cases these dies produced up to 18,000,000 tube parts between die sharpenings, where runs up to 100,000 parts were unusual with steel dies. Carbide inserts in dies for punching laminations from silicon steel sheets also gave outstanding service results.

Because of the tremendously increased activity in the aircraft industry during the 1937-46 decade, special attention was paid to press-forming operations on sheet-metal parts, particularly sheet aluminum and magnesium alloys. Tool engineers in this industry were called on to develop and make tools for forming, trimming and perforating sheet steel, aluminum and magnesium parts without taking the months of time that would have been needed for making steel tools of conventional design. They turned to the so-called quick and dirty methods of tool design—methods that were adaptable to the rapidly changing demands of designers of new warplanes. They employed plastics and low-melting-point metal alloys that could be cast to shape quickly, eliminating tedious toolmaking hours needed for steel or iron tools. Also they developed new, and improved old, sheet-forming methods that saved thousands of hours.

The rope drop hammer was revived as a sheet-forming machine, and it was supplemented by a more efficient air-operated counterpart. These units, when properly tooled, made many of the double-curvature sheet parts needed for completely streamlined aeroplanes. Lead, zinc and other soft-metal alloys were used to make forming tools for these hammers. The drop-hammer method differed from other sheet-forming processes in two ways. It was a free-fall operation and the operator could control its action as much as when a hand hammer was used. The second difference lay in the fact that this process had an upsetting or shrinking effect, rather than a drawing or stretching effect on the sheet being formed. The process was flexible and adaptable to forming a wide range of shapes.

Because the drop-hammer method did not have sufficient precision for some of the parts required, and because it was relatively slow as compared with press-forming operations, aircraft tool engineers continued studies of press-forming methods. Out of these studies came a number of novel tooling developments, chief among which probably was the Guerin process, in which sheet parts were formed between a heavy rubber pad and shaped die blocks made of metal, wood or plastic. The rubber pad was fixed in a container attached to the moving platen of the press and was forced to flow around the shaped die blocks as the pad was brought down against a pressure pad on the bottom platen. Full pressure applied by the press ram thus was exerted evenly in all directions on the exposed surfaces of the die blocks. Blanking, forming and punching operations could be performed on thin sheet parts placed on the die blocks.

Large-platen hydraulic presses having capacities up to about 5,000 tons were installed during World War II in aircraft plants for forming sheet parts by the Guerin process. Many of these presses were equipped with loading tables to shuttle the tools and material to and from the pressing block and so increase the efficiency and quantity of production possible from a single press. In these instances, a group of workers placed forming blocks and metal sheets on the loading tables outside the press, while pressure was being applied to a table load between the press platens.

An alloy of zinc with aluminum, copper and magnesium (Kirkosite) found wide use in the aircraft industry as a tool material. It was relatively inexpensive, easy to work with and could be reused to make other tools when the first tool had served its purpose. At first it was used principally to replace the zinc dies used for drop-hammer forming operations. Later it found wide use in making forming, blanking and piercing dies for press operations in which rubber pads were employed and in the construction of mating dies for more conventional punch-press operations. Actual over-all time for producing a cast die of this material often was as low as eight hours, compared with three or four days for tool steel dies. Rubber pads frequently were used with these dies as "strippers" to force the workpieces off the punches on the return stroke of the ram. Sometimes these pads were applied on both the punch and the die.

Plastic and semiplastic materials, such as the laminated plastics and pressed woods (Masonite), were widely accepted for making, forming and bending dies in the aircraft industry. They required less time to make, cost less and frequently had a longer useful life than actually required. Few such dies were required to make more than 5,000 parts before the part became obsolete because of design changes.

Many mating dies made of these materials formed intricate shapes from aluminum or magnesium alloy sheet stock to as close limits as would have been possible with more conventional metal dies. Tough, elastic thermoplastic materials also found use for making cast drop-hammer forming punches in the aircraft industry. Often these plastic punches were formed by pouring the melted material into the mating metal hammer die.

The plastic materials used were reclaimable without sacrifice of physical properties.

A number of aircraft plants made drill jigs and other tools, including forming dies that stood up under 8,000 lb. per square inch pressure in hydraulic press operations, from castable plastic materials. Among these materials were a phenolacetone thermoplastic and an acid-setting phenolformaldehyde thermosetting composition made up of 25%–30% ground walnut shell flour, used as a filler, with resin and an acid catalyst or accelerator. Other fillers used included wood flour and scrap plastic. The jigs were fabricated by securing the drill bushings to a master part, placing the part in a form and pouring the melted plastic material around it.

Like the rope drop hammer, the stretch-forming press was revived by aircraft production engineers for use throughout World War II. It consisted of a vertically movable platen on which a suitable form block was attached. The metal sheet was clamped over the top of the form between jaws fixed to the base of the machine. Upward movement of the platen forced the sheet to assume the contour of the form block. By using electric or hydraulic controls, the operator increased or retarded the rate of vertical travel of either end of the platen. This "rocking" of the form block distributed tension developed in the sheet as it was stretched, and aided in developing the desired form without wrinkles.

One of the machines developed during the war was fully hydraulic and had three rams supporting the platen. It was of 150-ton capacity, and the 84-in. long jaws could be positioned 28–150 in. apart. Another stretch press, announced in 1942, applied load to the sheet with 2 trunnion-mounted, 60-ton-capacity hydraulic cylinders. While the tool platen was mounted on three rams to permit positioning the tool block most advantageously, the block was not moved during the forming operation. Instead, the tension jaws acted in a constant, predetermined direction to maintain the best angle of pull over the edge of the block. Sheet breakage was reduced materially. With this unit, a sheet 267 in. long, 48 in. wide and 0.081 in. thick could be stretched into a continuous double curvature in less than 2 min. after the sheet had been inserted in the jaws and placed over the form block.

Form blocks for stretch presses during World War II were made of wood, cast iron, pressed wood (Masonite), soft metal alloys (Kirkite) or one of the cloth-base phenolic-resin-bonded materials. Concrete and cast plastics also were used satisfactorily. Wood blocks served well when production requirements were low. Other materials were necessary when quantities to be stretch-formed were 1,000 or more. (See also AUTOMOBILE INDUSTRY.)

Tubes of U.S. anti-aircraft guns, cast in one piece by a revolutionary method developed by the army ordnance department. Molten or liquid metal was poured into a chill mould and rotated at a high speed so that centrifugal force caused the metal to take the shape of the mould before it solidified, leaving a hollow in the centre. The casting was removed from the chill mould as soon as it was solid and rigid enough to keep its shape during handling. After cooling, it was heat treated to get the desired crystalline structure of the metal and then machine finished and further heat treated.

Great Britain.—The machine-tool industry in Germany and the United States was self contained. The industry in Great Britain was smaller, and there were many gaps which compelled the importation of special types of tools. Nonetheless, there were more than 10,000 different types or sizes of standard machine tools made in Great Britain while thousands of special tools were designed during the decade to perform specific operations with maximum efficiency. The British government was aware of the importance of this key industry and had set up a committee to report upon the measures that would be necessary to ensure an adequate supply of machine tools to meet the national requirements in the event of emergency. When the intentions of Germany could no longer be in doubt and firms in Great Britain had reluctantly accepted exploratory orders for munitions, and when it became, in consequence of the threat of war, necessary to develop the aircraft industry, machine-tool makers were called upon for the tools required.

At the beginning of 1937 the output of the machine-tool industry was at the rate of £8,250,000 per annum. At the outbreak of World War II in 1939 it had increased to £16,000,000 per annum. With the formation of the ministry of supply in June 1939, a machine-tool adviser was appointed in that ministry. In the legislation which was made necessary by the imminence of war, the Control of Machine Tools Order No. 1, 1939, had a prominent place. It gave to the minister of supply the widest powers concerning the production, distribution and use of machine tools so that the necessary priorities both in the manufacture and use of machine tools could be assured. At the outbreak of World War II the control of machine tools was set up within the ministry of supply. It continued until 1946 when an advisory council was appointed by the ministry to provide a means of regular consultation between the government and the machine-tool industry on matters concerned with the maintenance of an adequate and healthy British machine-tool industry in the interests of national defense and industrial efficiency. The importance of this key industry, so amply demonstrated during 1939-45, was not to be forgotten.

It was the duty of the machine-tool control to take such

steps as were necessary and practicable to ensure that only essential orders were placed. Licensing and examination of the utilization of machine tools were introduced for this purpose. Examination was directed both to plants already installed and to the use intended to be made of plants covered by prospective orders. As a result, manufacturing programs of contractors were simplified; production departments were able to weed out inefficient contractors; equipment was realigned between contractors with advantage to production. Thus great savings became possible in machines and labour employed, resulting in much greater production efficiency. Only scientific planning could bring about this result.

To assist the control in its work, an Emergency Machine Tool Armament corps (E.M.T.A.C.) was set up in Sept. 1941. It consisted of expert demonstrators and operators in different classes of machines who were recruited from the machine-tool trade and made available to all war contractors for the purpose of training labour and starting up new machines. The allocation section of the control was the department for arranging the fulfilment of priority requirements. In this function of its work the control was responsible to the main government priority committee until June 1942, when the ministry of production was set up, whereupon the machine-tool control became responsible on allocation questions to the minister of production. It is interesting to note that there was hardly any occasion when the control had to refer to higher authority on allocation problems, and this absence of disputes was a tribute to the co-operation achieved by the members of the supply departments who formed an inter-service machine-tool committee to advise the control on these matters.

The comparative smallness of the industry at the outbreak of World War II made a thorough control of machine tools essential to assure a rapid expansion of production and their provision for all manufacturing processes. The output of the British machine-tool industry, which had fallen as low as £6,500,000 in 1935, rose to a peak of £43,750,000 in 1942. At the same time, the production by the trade of cutting and engineers' small tools accounted for a similar increase in volume of output. Invaluable help came from the U.S. machine-tool industry. Importation of U.S. machine tools and cutting tools averaged about £22,500,000 a year during World War II. The peak was reached in 1943, with imports of £31,250,000. A machine-tool department with the British purchasing commission had been set up in Washington. Its task of procurement was greatly helped by the U.S. authorities' understanding of the importance of machine-tool and machinery supplies to Great Britain for the prosecution of World War II.

Other plants and machinery also came under control at the outbreak of war. The production of types essential to the manufacture of war supplies had been taken in hand after Adolf Hitler's attacks on Czechoslovakia and became the care of the ministry of supply on its formation in June 1939. Control was exercised to make the best use of existing resources and of labour. Control of other plant and machinery was vested in the board of trade. Reversing its usual role of fostering production in the interests of trade, it was concerned with preventing production not essential to the prosecution of the war. Indeed, the extent of World War II in which the British forces played their part everywhere, made an unprecedented call on Great Britain's manpower. Controls accordingly were designed not only to ensure production of those things that

Table IV.—Machine-Tool Production In Great Britain

Year	Value
1924	£ 3,507,000
1930	4,876,000
1934	4,637,000
1935	6,531,000
1936	9,347,000
1937	8,452,000
1938	13,300,000
1939	19,050,000
1940	29,200,000
1941	30,450,000
1942	43,750,000
1943	31,308,000
1944	25,764,000
1945	20,796,000
*1946	23,640,000

*Based on monthly average for seven months.

were needed but also to forbid production of nonessentials and to save manpower and womanpower wherever the provision of the right equipment could bring about this result. It is worth recording that, in the machine and tool industries themselves, out of a total maximum labour force of about 120,000 more than 25% were women. Before the outbreak of war, practically no women had been employed in these industries.

In 1945 and 1946 wartime controls were largely removed to allow initiative and freedom of choice to play their proper part in industrial affairs. While they existed, they taught the industry a useful lesson of co-operation in which selfish aims were subordinated to the general good. Such co-operation procured results far greater than would have been possible had individual interests constituted the beginning and end of endeavour. (P. H. M.)

McIntyre, Marvin Hunter

McIntyre (1878-1943), U.S. newspaperman and presidential secretary, was born Nov. 27, 1878, in La Grange, Ky. He started newspaper work at the turn of the century and later became editor of the *Washington Times*. In 1917, he entered the navy department as public relations officer and made the acquaintance of Franklin Delano Roosevelt, then assistant secretary of the navy. In 1932 McIntyre helped handle publicity for Roosevelt's presidential campaign. After the election McIntyre was given the post of assistant secretary and in 1937, after the death of Louis Henry Howe, he was made secretary, a post he held until his death, Dec. 13, 1943, in Washington, D.C.

Mackenzie King, William Lyon

See KING, WILLIAM LYON MACKENZIE.

McNair, Lesley James

McNair (1883-1944), U.S. army officer, was born May 25, 1883, in Verndale, Minn., and graduated from the U.S. Military academy in 1904. He served with the Funston expedition to Veracruz, Mexico, 1914, and the Pershing expedition to Mexico, 1916. During World War I he saw duty with the 1st U.S. division in France, was attached to general headquarters of the A.E.F. and was awarded the distinguished service medal. Before U.S. entry into World War II, he was assigned to duty at the Army War college in Washington, D.C. After reorganization of the war department general staff in 1942, McNair became commanding general of the army ground forces. He saw active duty in the North African campaign, and while at a forward observation post in northern Tunisia was wounded by shell fragments and returned to the U.S. for treatment. He resumed command of the ground forces on May 26, 1943, but subsequently left this post for what the war department termed an "important overseas assignment." On July 25, 1944, Gen. McNair was killed at a front line post near St. Lô, Normandy, when bombs dropped by U.S. planes fell short of their targets and hit U.S. lines by error.

McNarney, Joseph Taggart

McNarney (1893-), U.S. army officer, was born Aug. 28, 1893, in Emporium, Pa. He was graduated from the U.S. Military academy, West Point, N.Y., in 1915, and served with the U.S. air forces in France in 1917-18. In 1926 he was graduated from the Command and General Staff school at Fort Leavenworth, and in 1930 was graduated from the Army War college, Washington, D.C.,

where he then served as instructor from Aug. 1933 to March 1935. In March 1939 he joined the war plans division of the war department general staff. McNarney was made a member of the Joint Defense board for Canada and the United States in Aug. 1940, and served with the special observers group in London from May to Dec. 1941. He was a member of the Roberts commission that investigated the Pearl Harbor attack (Dec. 1941-Jan. 1942), and in March 1942 he was appointed deputy chief of staff, the youngest officer ever to hold that position. In May of the same year he was made a lieutenant general. In Oct. 1944 McNarney left his desk job to become deputy supreme Allied commander in the Mediterranean, and in 1945 he was promoted to the temporary rank of full general. When Gen. Dwight Eisenhower was elevated to the post of chief of staff in Nov. 1945, McNarney succeeded him as commander of U.S. forces in Europe and concurrently as commander of German occupation forces and U.S. representative on the control council.

McNary, Charles Linza

McNary (1874-1944), U.S. politician, was born June 12, 1874, near Salem, Ore. He studied law at Stanford university and was dean of Willamette College of Law, Salem, Ore., 1908-13. In 1913 he was elected to the Oregon supreme court, and in 1916 he became chairman of the Republican committee for the state. The next year he was appointed to fill out an unexpired term in the U.S. senate, was elected to that office in 1918 and served there until his death. During his early career in the senate, McNary was a fighting liberal and an advocate of farm relief. He was co-author of the series of McNary-Haugen farm relief bills, several of which were passed by both houses of congress, but were vetoed by Pres. Calvin Coolidge. He became minority leader of the senate in 1933, and voted for many New Deal measures in the early days of the Roosevelt administration. However, he led the fight that defeated the supreme court reorganization measure, and in the 1940 presidential election he was selected as Wendell Willkie's running mate. Senator McNary died in Fort Lauderdale, Fla., Feb. 25, 1944.

McNaughton, Andrew George Latta

McNaughton (1887-), Canadian army officer and scientist, was born at Moosomin, Sask., Feb. 25, 1887. He was educated at McGill university and served in World War I, being wounded twice and mentioned in dispatches three times. In May 1919 McNaughton was appointed member of the committee for the reorganization of the military forces of Canada. He was named deputy chief of the Canadian general staff in 1922 and was promoted to the office of chief of general staff in 1929. As president of the Canadian national research council from 1935 until 1939, McNaughton directed research in electrical and aeronautical investigations, and was joint inventor with W. A. Steel of the cathode-ray direction finder. In Oct. 1939 he was appointed commander of the Canadian active service forces and was responsible for the intensive training and scientific arming of the Canadian forces both at home and abroad, including the Canadian troops which took part in the Allied raid at Dieppe on Aug. 19, 1942. Because of ill-health Gen. McNaughton resigned the command of the Canadian active service forces and announced his retirement in Dec. 1943.

In Nov. 1944 Gen. McNaughton returned to public service as minister of national defense, succeeding Col. James L. Ralston. Failing in two attempts to secure a seat in the house of commons, as representative of an

Ontario constituency in Feb. 1945 and as representative from Saskatchewan in June, he resigned from the ministry in August and was appointed chairman of the U.S.-Canadian permanent joint defense board. In April 1946 he was named Canadian representative on the United Nations atomic energy commission.

McNutt, Paul Vories

McNutt (1891-), U.S. politician and government official, was born July 19, 1891, in Franklin, Ind. Educated at Indiana university, Bloomington, Ind. (A.B., 1913), and at Harvard university, Cambridge, Mass. (LL.B., 1916), he served on the faculty of the Indiana university law school from 1917 to 1925, and was dean of the law school from 1925 to 1933. In 1933 he resigned to become governor of Indiana. He was U.S. high commissioner to the Philippines from 1937 to 1939, when he was appointed first administrator of the Federal Security administration. In April 1942 President Roosevelt named McNutt head of the War Manpower commission, and in December of that year vested him with full authority to hire and distribute workers for civilian war industries and with full control of the Selective Service system; in Dec. 1943 a new draft bill was enacted which deprived McNutt of his power over Selective Service. Appointed by Pres. Truman high commissioner to the Philippines on Sept. 6, 1945, McNutt became U.S. ambassador after the commonwealth was declared a republic on July 4, 1946.

Madras

Capital of Madras presidency, the chief seaport on the eastern coast of India and third city of India, Madras is situated in 13° 4' N. and 80° 17' E. In 1941, the city had a population of 777,481. Municipal progress was greatly interrupted by World War II, and, because of threats of Japanese bombing attacks, a large proportion of the population temporarily left the city to go inland. The length of metalled roads was extended from 358 mi. in 1936 to 372 mi. in 1944, and the main streets were lighted with electricity. In 1942 a serious attempt was made to eradicate the slums; two areas of 492 ac. were acquired by the municipality to be used as housing estates. Education was nominally compulsory, but there were practical difficulties in enforcing the law, especially as regards girls. In the period, the number of children attending the public elementary schools increased from 27,282 to 37,613. Madras university had 37 affiliated colleges with 12,000 students. In 1944-45 the birth rate was 31.45 and the death rate 35.72 per 1,000. Infant mortality was 273.77 per 1,000 registered births. (H. G. RN.)

Madrid

The capital of Spain and of the province of Madrid, on the left bank of the river Manzanares, had a population in 1940 of 1,088,647. In Jan. 1937, when the British embassy moved to Valencia—the republican capital during that year—Madrid had been under siege by General Francisco Franco for two months. Attempts made to cut the Madrid-Valencia road and then to attack the city from the northeast both failed. Though continually bombed and all but starving, the capital held out, with magnificent morale, till Catalonia had fallen and the whole of the

nationalist strength, reinforced by help from Germany and Italy, could concentrate upon it. On Feb. 12, 1939, Dr. Juan Negrín's cabinet returned to Madrid, re-established as the republican capital. On March 5 this was superseded by a "National Council of Defense" which quickly negotiated a surrender.

Entering Madrid, where hundreds were dying daily of starvation, on March 28, the nationalists quickly relieved the immediate suffering, set about rebuilding and published ambitious plans for the capital's enlargement and amelioration. Soon after the victory parade (May 19, 1939), General Franco's ministries arrived from Burgos; schools and colleges re-opened and Madrid's appearance re-approached the normal. Much bomb damage, however, still remained: in particular, the grandiose university city, which had borne the brunt of the attack, was for two years a total ruin, and was not fully restored until 1945.

During the hardest of the years following the civil war, Madrid, with its large population, suffered terribly. By Nov. 1940 its bread ration was from three to six ounces (varying with the individual's income) and in the following spring this ration was halved. Other foods also being scarce, the black market flourished, as also did street-begging, epidemics (notably typhus in 1941) and tuberculosis. From the end of 1942 the food situation improved, though inordinately high prices still ruled.

As the capital of Spain, Madrid reflected many of the vicissitudes of the country's life during World War II. Diplomatic battles were fought in the embassies; street demonstrations marked Spain's ill-judged annexation of Tangier (1940); contingents of the Blue division paraded before leaving for Russia (1941-44). German penetration, at its height during 1940-42, gradually diminished after the North African landings, and, on the defeat of the axis powers, the Germans still in Madrid were slowly dispatched, after much pressure by the United Nations, to their own country.

Maglione, Luigi

Cardinal Maglione (1877-1944) was born March 2, 1877, at Casoria near Naples. Ordained priest in 1901, he entered the papal diplomatic service and was sent to Switzerland in 1918 as special representative of Pope Benedict XV. Through his efforts a nunciature was established at Berne and he became the first nuncio there. He was consecrated titular bishop of Caesarea of Palestine Sept. 26, 1920. In 1926 he was transferred from Switzerland to Paris as apostolic nuncio to France. He was created a cardinal on Dec. 16, 1935, and the following year was recalled to Rome to serve on several congregations of the Curia. Pope Pius XII named Cardinal Maglione papal secretary of state on March 11, 1939, a post Pius himself had held before his elevation to the papacy. Some authorities interpreted the appointment as a papal gesture of amity for the democratic governments, although the new secretary gave little indication of his political leanings during the troubled years of World War II. He died at his home in Casoria, Aug. 22, 1944.

70 Magnesium

The history of the magnesium industry during World War II was a good example of what could be accomplished under the pressures of necessity. In only a few short years, magnesium was raised from the rank of a minor metal to that of a major one, and it remained to be seen at the end of the decade 1937-46 whether sufficient demand could be created for peacetime uses to enable it to retain its major ranking. Exact data were lacking on magnesium production in many countries, but estimates are presented in Table I.

Table I.—World Production of Magnesium

The greater portion of the war expansion in the production of magnesium was made in the United States, where output was increased eightyfold between 1937 and 1943. Most of the increased capacity was in government-owned plants, the disposal of which became a problem after the war. It was recommended that 7 plants be disposed of for any available use, and that 6 others, with an annual capacity of 106,000 tons, be retained in operation by lease or sale, or kept in standby condition.

The war uses of magnesium were probably rather generally misunderstood. While casings and powder for incendiary bombs were an important factor, engine and structural parts for aeroplanes were the largest item; castings alone accounted for 80% of the 1944 consumption.

(G. A. Ro.)

Magnesium Compounds

During the course of the decade, the raw materials used in the production of magnesium compounds were radically altered. Formerly the commercial forms of magnesium came almost entirely from crude magnesite, while magnesium chloride and other compounds were derived mainly from well brines. To these basic raw materials were added bruceite, dolomite, sea water bitterns, dry lake brines and raw sea water, from any of which almost any desired magnesium compound could be prepared by proper manipulation of the processing procedure.

Giant magnesium container being carried over retort furnaces at the plant of the Permanente Metals corporation near San Francisco. Managed by Henry J. Kaiser, the plant began full production in 1943

Since the major world producers of magnesite outside of the United States were the U.S.S.R., Austria, Manchuria, Greece and Czechoslovakia, little information could be given on foreign supplies, and attention centred on progress of the industry in the United States, where it was necessary to expand production to meet both expanding demand and declining imports. Total imports of all types of magnesium compounds decreased from 50,778 short tons in 1939 to 6,042 tons in 1945.

Production of Magnesium Compounds in the United States
(Short tons)

	Crude Magnesite	Caustic Calcined	Refractory	Total Magnesia	Other Compounds	Dead-burned Dolomite
1937	203,473	10,031	83,204	93,235	64,777	617,706
1938	97,000	7,400	38,738	46,138	70,733	366,626
1939	198,980	10,157	86,077	96,234	85,754	671,561
1940	333,166	16,261	140,668	156,929	108,266	867,909
1941	374,799	30,225	201,481	231,706	137,357	1,069,887

Maine

The extreme northeastern state of the United States, Maine was admitted as the 29th state in 1820; popularly known as the "Pine Tree state." Land area 31,040 sq.mi.; water area 2,175 sq.mi.; population (1940) 847,226; rural 504,169; urban 343,057. Capital, Augusta (19,360). Other cities: Portland (73,643); Lewiston (38,598); Bangor (29,822). The population on July 1, 1944, was estimated at 793,600 by the U.S. bureau of census.

In Jan. 1937 Lewis O. Barrows was inaugurated governor; he had been elected in 1936 when only Maine and Vermont out of the 48 states remained Republican. In the same month three Republican congressmen, James C. Oliver, Clyde H. Smith and Ralph O. Brewster, former governor, took office. Senator Wallace H. White, Jr., was re-elected by a small majority over Louis J. Brann, retiring Democratic governor. For the first time since 1931, the whole Maine delegation at Washington, D.C., was again Republican. Perhaps the main political event of 1937 was the defeat by a majority of more than two to one at a state-wide referendum of a law proposing a sales tax to secure revenue for public schools and old-age pensions. The legislature passed legislation that for the first time set up a merit system for state employees. A special session of the legislature late in the year provided the necessary revenue for the schools and old-age pensions by increasing liquor taxes and reducing the appropriations of various state departments.

In the 1938 election, the Republicans increased their majority in the legislature, and re-elected Governor Barrows and three congressmen: Oliver, Smith and Brewster. The merit system law of 1937 was operating in only a few departments at the end of 1938, partly because of lack of funds. Northern Maine citizens formed a committee to study the feasibility of making Aroostook county the 49th state. The Maine Municipal association, only organization of its type in New England, completed its second year in 1938 with 171 cities and towns as members. In addition to its publication and advisory service, and its local and state conventions, it announced a new magazine, *The New England Townsman*.

The regular biennial session of the legislature, meeting

in 1939, decided to continue the state's narrow tax base, depending largely on auto, gasoline, liquor and real estate levies. No major bills were passed; the department of health and welfare was reorganized, and a host of minor bills and amendments were approved. Several municipalities were granted the right to adopt the manager form of government. Dog racing, lottery and liberal old-age pension bills were killed. A proposed constitutional amendment increasing the state debt limit to permit additional highway bonds was defeated by the voters in Sept. 1939. Old-age assistance appropriations were increased without passing any major tax bills, funds being procured from other sources.

In 1940 the *Bangor Daily News* claimed the credit for disclosures of irregularities and embezzlement after a private firm of auditors had checked the work of the state auditing department. On April 1, shortly before he was to testify, William Runnells, state controller, was found shot. Auditors reportedly discovered shortages in his accounts totalling more than \$157,000. As a result of the scandal and subsequent investigation, three high officials resigned and a permanent legislative investigating and research committee was created. Investigation disclosed widespread administrative inefficiency and disregard for the statutes. A defective administrative organization and the continuance of the spoils system appeared to be responsible.

Campaign charges of graft and inefficiency did not cause defeat of the well-entrenched Republican party in the 1940 election. Senate president Summer Sewall was elected governor by a vote of 162,719 to 92,003 on a platform promising honesty, economy and efficiency. In the same election (September), three Republican representatives and a senator were elected: Oliver (1st district) re-elected, Margaret Smith (2nd district) and Frank Fellows (3rd district). Representative Ralph O. Brewster won the senate seat vacated by Frederick Hale in the June (Republican) primary. Fewer Democrats were elected to the legislature than in 1938. An election surprise was the narrow Willkie margin of 163,951 to 156,478 votes for President Roosevelt in November, after the decisive Republican victory in September and the large majorities in 1932 and 1936. Maine was one of the few states where Roosevelt gained votes in 1940. The legislature met in special session in May, July and October.

Among controversial measures enacted by the regular session of the legislature in 1941 were a premarital examination law, a contributory pension bill covering state employees and a cigarette tax bill, the returns of which were earmarked for old-age assistance. Various tax rates were increased, including a half-cent-a-gallon rise in gasoline. The gas tax increase was defeated in a referendum election, and the governor vetoed the pension bill. The governor and his finance officers made changes in budgeting, accounting, and auditing procedures of the state, designed to improve efficiency and prevent financial scandals. The governor charged the liquor commission with inefficient and lax administration of the laws, and replaced all three members, with his former secretary as chairman. Senator Brewster took office in Jan. 1941 for a six-year term.

A special session of the legislature convened Jan. 12, 1942. A defense measure granted emergency powers to the governor and another authorized the issuance of war bonds. State employees receiving less than \$30 weekly were given a 10% raise, and a jointly contributory retirement system was established. The permanent legisla-

tive investigating committee continued its studies of state agencies and prepared a report for the 1943 legislature. Loss of state employees to federal agencies and war industries caused a critical shortage of workers in the state hospitals for the insane. Pay increases were granted to prevent a breakdown of state services. Republican governor Sumner Sewall was elected in Sept. 1942 for his second term. Senator White (Rep.) was re-elected for a full term. Republican representatives Margaret C. Smith and Frank Fellows were re-elected; Robert Hale defeated James C. Oliver in the June primary and former Democratic governor Brann in September. Balloting was the lightest since 1930.

The 1943 regular session of the legislature met from Jan. to April. Most of the bills passed were concerned

with routine matters or amendments to existing laws. Fish and game laws were simplified and a postwar planning fund established. The state personnel board granted a general pay increase in all departments, after the legislature had appropriated larger amounts for personal services for the biennium beginning July 1, 1943. Numerous individual increases were also granted, but rapid turnover and shortages continued to be serious, especially in state institutions.

Two special sessions of the state legislature met in 1944, one in April and one in Sept. In the September election Horace A. Hildreth (Rep.), president of the state senate, was elected governor to succeed Sumner Sewall. The voters approved an amendment to the state constitution which segregated automobile and gas taxes for highway purposes. Thomas E. Dewey carried the state in November in his bid for the presidency, by a vote of 155,434 to 140,631 for Franklin D. Roosevelt.

The regular session of the legislature met from Jan. to April, 1945, with George D. Varney as president of the senate and George Barnes as speaker of the house. Veterans' preference legislation and postwar public works plans were enacted. Horace A. Hildreth (Rep.) took office as governor (1945-46 term). Five Republicans served in congress: Robert Hale, Margaret Chase Smith, Frank Bellows in the house; Wallace H. White, Jr., and Owen Brewster in the senate.

Governor Hildreth was re-elected in the election of Sept. 1946, for the 1947-48 term. Republicans retained control of the 151 member house and the 33 member senate. A sales tax-soldier's bonus measure enacted at a special session of the state legislature was defeated by referendum. (E. F. D.; X.)

Makin, Norman John Oswald

Makin (1889–), Australian statesman, was born March 31, 1889, at Petersham, New South Wales. The son of impoverished parents, he was forced to leave school in his youth and worked as delivery boy, bookseller and patternmaker. Becoming active in Labour party politics, Makin was elected in 1919 to the Australian house of representatives as member from Hindmarsh. He was speaker of the house from 1929-32 and was president of the Labour party in 1936. A member of the Advisory War council in 1940, Makin was appointed minister of the navy and munitions in Curtin's Labour cabinet in Oct. 1941; in 1945 he also was given the additional portfolio of minister of aircraft production.

Makin headed the Australian delegation that attended the United Nations Security council sessions in London. On Jan. 15, 1946, he declared that the atomic bomb should be placed at the disposition of the Security council's police force which under the charter would be designed to keep the peace. At the first meeting of the Security council Jan. 17, 1946, he was elected president under the alphabetical rotation plan.

Malaya, British

See MALAYAN UNION; WORLD WAR II.

Malayan Union

The area known as British Malaya was divided, at the beginning of the decade 1937-46, into three classes of territory known severally as the Straits Settlements, the Federated Malay States and the Unfederated Malay States. The Straits Settlements, which ranked as a British colony, comprised the islands of Singapore, Penang, Christmas, Labuan and Cocos, as well as the peninsular districts of Malacca and Province Wellesley. The Federated Malay States were four in number (Perak, Selangor, Negri Sembilan and Pahang), all situated on the mainland of the Malayan peninsula. The Unfederated Malay States (Johore, Kedah, Perlis, Kelantan, Trengganu and Brunei) were also situated on the mainland with the exception of Brunei, which formed part of the island of Borneo.

British relations with all these various classes of territory were conducted through a single officer who combined the functions of governor of the Straits Settlements with those of high commissioner for the Malay states, and, in a third capacity as British agent, served as the channel of communication between the British government and the states of Sarawak and North Borneo (see BORNEO, BRITISH). In the Settlements the governor's functions were similar to those of other colonial governors. He was directly responsible for the administration of territory under full British sovereignty. In the Malay states the position was not quite so simple. British rights and obligations were defined in every case by a formal treaty concluded with the sultan concerned. The various treaties were drawn in very similar terms. Broadly speaking, each sultan was required under treaty to accept the advice of the British crown, as conveyed through the high commissioner, in all matters not affecting Malay custom or the Mohammedan religion. The high commissioner's authority was exercised in each state through a local representative known in the Federated Malay States as British resident and in the Unfederated Malay States as British adviser. In the Federated Malay States, the high commissioner communicated with the British resident and the state administrations through an officer known as the federal secretary whose sphere covered the whole federation but who exercised no executive authority in any but federal matters. The whole machine was a somewhat complicated one; but it had grown up in conformity with local needs and traditions and worked smoothly enough in normal times and in normal circumstances.

Total area of British Malaya: 53,222 sq.mi. (Straits Settlements 1,356 sq.mi., Federated Malay States 27,540 sq.mi. and Unfederated Malay States 24,326 sq.mi.). It is situated in the southern portion of (and islands adjacent to) the long strip of territory known as the Malay peninsula, which runs southward from the main Asiatic continent to a point just north of the equator.

Total pop. (1931 census) 4,383,850 (1941 est. 5,560,444); (Straits Settlements 1,114,015 (1941, 1,420,841); Federated Malay States 1,713,096 (1941, 2,193,605); Unfederated Malay States 1,556,739 (1941, 1,889,648). Principal racial elements (1931): Malays, Chinese and Indians. Taking the country as a whole: Malays 1,872,000, Chinese 1,709,000,

Indians 624,000. The racial percentages to total population in the various classes of territory were as follows: in the Straits Settlements, Malays 26%, Chinese 60%, Indians 12%; in the Federated Malay States, Malays 35%, Chinese 41%, Indians 22%; in the Unfederated Malay States, Malays 70%, Chinese 21%, Indians 7%. In the city of Singapore the Chinese represented about 74% of the population.

Chief towns: Singapore (headquarters of the governor of the Straits Settlements and high commissioner for Malaya) (pop. 544,000 in 1931; 1941 est. 760,226); Kuala Lumpur (local headquarters of the administration of the Federated Malay States) (c. 140,000; 1939, 138,425); Ipoh (67,000); and Taiping in the Federated Malay States (39,000); Johore Bahru (cap. of Johore, the largest of the Unfederated Malay States) (27,000); Brunei (1937 est. 10,453). Languages: Malay, Chinese, Indian languages and English. Religion: Mohammedan, Hindu, Buddhist and Christian.

Sir Shenton Thomas assumed office as governor of the Straits Settlements and high commissioner for the Malay states on Nov. 9, 1934. On the fall of Singapore (Feb. 15, 1942) he fell into Japanese hands and remained a prisoner for the rest of World War II. From the British reoccupation (Sept. 1945) to the end of March 1946, Malaya was under military administration. In April 1946, as part of the postwar reconstruction of British civil authority in the area, Sir Edward Gent was appointed governor of the Malayan Union and Sir Franklin Gimson governor of Singapore. In May 1946 Malcolm MacDonald was appointed governor-general with a sphere of authority covering all British territories in Malaya and Borneo.

Wealthy Malaya.—Malaya, at the beginning of the decade, was one of the richest areas in the British colonial empire. Its two chief products—far outweighing all others in magnitude and importance—were tin and rubber. In respect of rubber the country, though it had a close rival in the Netherlands East Indies, could claim to be the largest producing territory in the world. It was estimated that, at the end of 1937, the total area under rubber was 3,273,000 ac. The Malayan production of tin was also greater than that of any other country, the Netherlands East Indies again being the nearest rival. Malaya's output of tin ore was estimated in 1937 at 37% of the total world production of 228,690 short tons. The tin-mining industry was one in which both Europeans and Chinese were interested. About 70% of the mines were operated by European concerns (in which the Chinese also had shares) and the remaining 30% by Chinese firms. The labour employed in the mines was, and had been for many years past, predominantly Chinese. Labour on the rubber plantations was confined for the most part to immigrant Indians whose general practice was to reside on the estates for a limited number of years and eventually to return to India. The Malay community, which by 1940 had fallen slightly below the Chinese in point of number, played little active part in the immense industrial progress which the country had achieved. The Malay was seldom a wage earner by choice. He preferred to preserve his independence and tended, notwithstanding the rapid industrial development that was going on all round him, to carry on traditional occupation as a fisherman or (more usually) as a farmer cultivating his rice, coconuts and vegetables, and increasing his cash income when he found it desirable to do so by tapping his own rubber trees. Nine out of every ten Malays lived in the rural districts of the country. Insofar as they had taken to wage earning (a comparatively late development), they found employment in supervisory rather than in manual labour. Many were employed as

Rice for hungry British Malays was brought by R.A.F. Sunderland flying boats during an acute rice shortage in 1945. Native boatmen are shown unloading a shipment

policemen, watchmen, tally clerks or in some similar occupation.

Among the more important questions that came to the front during the early years of the decade was that of providing improved facilities for higher education in Malaya. With a view to dealing with the matter comprehensively the British government sent out a special commission from England whose terms of reference covered all aspects of higher education in the country and particularly the work of Raffles college, Singapore (an institution established in 1929 to provide advanced instruction in English). The commission was also instructed to inquire into the possible development of a university for Malaya. It reported in June 1939, some three months before the outbreak of World War II. The conclusion reached was that the day had not yet arrived for the establishment of a fully-organized university, but the recommendation was made that, with that ultimate object in view, preliminary steps should be taken without delay for the fusion of Raffles college and the Medical college at Singapore into a single University College of Malaya controlled by a joint principal. The intervention of the war prevented further development along the lines proposed.

Malaya had never been looked upon as a recruiting ground, on any considerable scale, for the armed forces of the British empire. But there were military developments of some importance in the country during the years immediately preceding the war. A regular Malayan regiment was raised as an experimental measure at the expense of the Federated Malay States. At the outbreak of the war, it was regarded as having passed the experimental stage and was declared fit for active service. It played its part, not without credit, in the disastrous Malayan campaign. Little use was made of the Chinese community for military purposes. The failure to tap this source of recruitment was one of the reproaches brought against the British authorities after the fall of Singapore. Plans for the formation of Chinese labour units were under active consideration at one stage, but they had not been carried into effect by the time that Malaya became a theatre of hostilities.

Sense of Security.—The outbreak of World War II did

not, in the initial stages, produce any very pronounced effect upon the general situation in British Malaya. The region was far removed from the scene of active hostilities and must have seemed to its inhabitants in those early days to be as secure from the shocks of battle as any country in the world. There was little immediate increase in recruitment for military service. The view taken by the British government was that the primary function of Malaya was not to provide recruits for the armed forces but to stimulate by all possible means the production of tin and rubber, both of which were commodities regarded as vital to the Allied war effort. In addition to concentrating upon this all-important object, Malaya made other valuable contributions to the general war effort during the first two years of hostilities. The Malay sultans set an example of princely generosity in their pecuniary gifts to the British exchequer. In all, a total of about £20,000,000 was raised in Malaya as a whole for purposes connected with the prosecution of the war. It was made up of contributions in which members of all races—rich and poor alike—took their share. The amount subscribed in the country represented two-thirds of the total contribution of the British colonial empire. A local defense corps was raised in which men of all races served side by side. Between 80% and 90% of the European male community was embodied in active and passive defense organizations.

Whatever may have been the initial sense of security in Malaya, it received something of a shock when France collapsed in June 1940, leaving French Indo-China, one of Malaya's nearest neighbours, exposed to Japanese influence and infiltration. This was, in fact, though it may not have been fully recognized at the time, a turning point in Malayan war history. Free access to French territory proved an immense asset to the Japanese. It enabled them to establish a strong position in the neighbouring territory of Siam (Thailand) and so to acquire a base from which, when the time arrived, they could direct their attack upon Malayan territory with the maximum effect. For many months after the fall of France the intentions of the Japanese remained uncertain. British relations with Japan were critical throughout this period, but there were times when the danger of an armed conflict seemed to have receded into the background. The situation changed almost

from day to day, and hopes of a peaceful settlement—doomed in the end to disappointment—were maintained up to a very late date. During the autumn of 1941, the British government, seriously disquieted by the general situation in the far east, took steps for the better co-ordination of their interests throughout the whole area. For this purpose a British minister of cabinet rank (Alfred Duff Cooper) was appointed resident minister for far eastern affairs with headquarters at Singapore and with general authority to direct British policy (subject to the instructions of the London cabinet) and to furnish political advice to the British naval and military high command in the far eastern theatre. Duff Cooper's assumption of office synchronized almost exactly with the outbreak of hostilities in the far east. He held the post for a bare month; with the creation of a unified command for the whole of the Southwest Pacific area, with General Sir Archibald (later Field Marshal Viscount) Wavell as supreme commander, it was considered that there was no longer any scope for the activities of a resident minister, and Duff Cooper was accordingly recalled to England. He left Singapore on Jan. 13, 1942.

Malaya Doomed.—On Dec. 7, 1941, while negotiations between Japan and the United States were still in progress at Washington, the Japanese air force delivered a surprise attack on the U.S. naval base at Pearl Harbor. That meant war with Great Britain as well as with the United States. The Japanese were prompt to act against Malaya. Singapore received its first air raid in the morning of Dec. 8, and on the afternoon of the same day a Japanese landing was repulsed on the Malayan coast. Two days later the British battleship "Prince of Wales" and battle cruiser "Repulse" were attacked and sunk by Japanese aircraft, Admiral Sir Tom Phillips, the recently appointed British naval commander in chief in the far east, going down with his ship. The practical effect of these two incidents—the attack on Pearl Harbor and the destruction of the British battleships—was to cripple Anglo-American sea power in the Pacific for many months to come. Having acquired predominance both at sea and in the air, the Japanese were not slow to press forward their campaign of aggression.

In Malaya the first serious British reverse occurred when the island of Penang had to be evacuated on Dec. 18, 1941. Ipoh, the centre of the tin industry, fell on Dec. 29. Kuala Lumpur was occupied on Jan. 10, 1942. By Jan. 14, 1942, the British retreat had reached as far south as the northern border of the Johore state. Later, the British troops fell back upon Singapore Island where the Japanese made their first landings on Feb. 8. By Feb. 13 the city of Singapore was closely invested and its water supply was cut off. On the 15th it surrendered unconditionally.

The fall of Singapore was one of the most resounding reverses ever sustained by British arms. The great maritime fortress, on the construction of which immense sums had been expended, and which was believed to be virtually impregnable from the sea, had proved powerless to resist a determined overland attack. The general consternation that resulted led, as was perhaps only to be expected, to much hasty and ill-considered criticism. The criticism was not confined to the military conduct of the campaign. The civil authorities in Malaya were accused of incompetence and lack of foresight and resolution; the Asiatic community—or at least some sections of it—of "fifth-column" activities and of rendering assistance to the Japanese in the field. The agitation died down in the course of time, as such agitations do. The accusations against the British au-

thorities lacked substance; and subsequent investigations proved that the charges of "fifth-columnism" against the Asiatics rested upon the flimsiest foundation. They also brought to light a number of cases in which the local inhabitants—both Chinese and Malays—had rendered devoted help to isolated British units in the course of the campaign. In Singapore itself the Chinese community—without distinction of party—did invaluable work in the sphere of civil defense. The story of the Malayan campaign may be summed up in a single sentence. The Japanese had gained control, for the time being, both of the sea and of the air; against that combination there could be no adequate defense. (See WORLD WAR II.)

Iron Curtain.—With the capture of Singapore an iron curtain fell across the Malayan scene and was not lifted again for three and one-half years. As a Japanese-occupied territory Malaya underwent experiences similar to those of other eastern territories that came under Japanese control. Trade was stifled because markets and shipping were not available. Industry languished. The whole economy of the country was dislocated by the inefficiency and corruption of the military bureaucracy. Mechanical, cultural and economic interests were systematically neglected. Outside the island of Singapore, and more particularly in the rural districts of the mainland, medical and health facilities, built up at great expense and raised to a high standard of efficiency by the British authorities, suffered a disastrous setback. The Asiatic community had to reconcile itself to an alien regime, which on the whole was apparently more favourable to the Malays than to the Chinese. What they felt about it all could best be inferred from the enthusiasm with which, when their long ordeal at length ended, they welcomed the returning British troops. The European community, cooped up in internment camps behind barbed wire entanglements, did their best to maintain

Singapore merchant displaying unrationed silks and other fabrics to a group of British sailors shortly after the close of World War II

some semblance of civilized life both for themselves and for those Asiatics who were their fellow prisoners. In the matter of education, remarkable work was accomplished. Camp schools were set up both for boys and girls. Small committees of school teachers drew up an appropriate syllabus. It was even found possible, during the later stages of internment, to hold school certificate examinations for qualified candidates. The first was held in Jan. 1945 and the second in the following August. A full report of the two examinations was submitted to the Cambridge examination syndicate, which agreed to accord recognition to the results achieved. Much valuable work was also done, under conditions of the greatest difficulty, in medical and health matters. Efforts were made by British medical personnel to maintain a minimum health service in the city of Singapore and by that means to control the spread of epidemics. In fact, the city suffered less during the time of Japanese occupation than might have been expected. A report drawn up shortly after the British reoccupation in Sept. 1945 showed that the general health position was surprisingly good except for a rapidly increasing incidence of tuberculosis and malaria. Malaria showed some signs, which were happily not borne out by the event, of developing into a serious epidemic. Sanitary services deteriorated greatly under Japanese rule, but taken as a whole the death rate at Singapore was not greatly in excess of what had been recorded in specially unhealthy years before the war.

Peaceful Reconquest.—During the first half of 1945, the tide of war in the far east went steadily against the Japanese. By May 3 their expulsion from Burma was virtually complete. Plans were in preparation for a large-scale Allied expedition for the reconquest of Malaya. It was revealed after the war by Admiral Lord Louis Mountbatten, who was in supreme command of the forces in this area, that 250,000 men, with full air support, would have taken part in the attack. As it happened, no such action was found necessary. Japan surrendered on Aug. 14, 1945. On Sept. 5, 1945, British, Indian and Gurkha troops landed at Singapore. They met with no opposition and the re-establishment of British authority in Malaya was peacefully and rapidly effected. The returning British troops received a warm welcome from all sections of the population.

For many months before the end of the war the British government had been engaged in formulating plans for the future administration of Malaya after the ejection of the Japanese forces. An official statement on the subject, foreshadowing political changes of a far-reaching character, was made in the British house of commons on Oct. 10, 1945, scarcely more than five weeks after the reoccupation of Singapore. On that occasion the secretary of state for the colonies laid special emphasis on the "need to promote the sense of unity and common citizenship which will develop the country's strength and capacity in due course for self-government within the British commonwealth." With this object in view it was proposed to create a constitutional "union" of Malaya and to institute a Malayan citizenship which would give equal rights to all persons claiming Malaya as their homeland. The Malayan Union was to include all the nine states in the Malayan peninsula as well as the two British settlements of Penang and Malacca. The town and island of Singapore were to be treated separately in the first instance.

New Union.—To carry these proposals into effect it was necessary to conclude new agreements with the Malayan sultans conferring full jurisdiction over their territories upon the British crown. A special representative was sent

out to Malaya, who lost no time in negotiating new treaties with the rulers, both federated and unfederated. An announcement to this effect was made in the British parliament on Jan. 23, 1946. Further action followed without delay. As soon as the period of British military administration came to an end (April 1, 1946) Malaya was grouped under two governments: the first known as the government of Singapore (covering the previous settlement of that name and including Cocos and Christmas islands as well as the island of Singapore itself), and the second as the government of the Malayan Union, comprising the nine Malay states of the peninsula and the British settlements of Penang (including Province Wellesley) and Malacca. Kuala Lumpur was chosen as the capital of the union. A governor was appointed to each of the two territories; and a new post was created—that of governor-general—to co-ordinate and direct the policies not only of Singapore and the Malayan Union but also of Sarawak and North Borneo, those two territories having become the direct responsibility of the British government. The first incumbent of the post of governor-general was Malcolm MacDonald, an ex-secretary of state for the colonies and son of the former British prime minister. He assumed office in May 1946.

Meanwhile, the new policy had aroused considerable criticism both in Malaya and in Great Britain. There was adverse comment on the rapidity with which the new treaties with the Malayan sultans had been concluded. The sultans themselves, though they had signed the revised treaties, complained later that they had been induced to act with precipitation and had not fully appreciated the implications of their action. In particular, the provisions in regard to citizenship of the Malayan Union were the subject of much opposition. It was urged that they were unfair to the Malay community in that they placed two sections of the population, viz., the Malays themselves, whose interests were wholly bound up in Malaya, and the Chinese, who retained Chinese nationality under the laws of China and in many cases were associated with Malaya only temporarily, on too level a footing.

In response to this criticism the British government, while declaring its continued adherence to the principle of common citizenship, gave an understanding on March 8, 1946, that the new citizenship would not actually be brought into effect until there had been opportunity for full local discussion of the terms on which it should be granted. As already stated, the Malayan Union came into existence on April 1, 1946, but opposition from the sultans and from Malay political leaders continued to develop. In an endeavour to solve these difficulties in a friendly and constructive manner, the sultans and Malay leaders were persuaded by the governor-general and the governor of the Malayan Union to enter into discussions, the scope of which it was intended to extend later so as to include representatives of all important communities in Malaya. Once inaugurated, the discussions proceeded on their course, but no final decisions had been reached by the end of 1946.

Malinovsky, Rodion Yakovlevich

Malinovsky (1898-) Soviet army officer, was born in Odessa of peasant parents and was drafted in the tsarist army in World War I. He served in 1915 with one of the Russian brigades in France, fighting beside British and U.S. troops in the Amiens-Arras-Reims region. Malinovsky left France for Russia to take part in the bolshevik revolt of 1917. After serving as an officer during the civil war, he returned to Odessa. Soon he was back in the army, however, and when World War II broke out he held the rank of major general and was commander of the soviet 6th army. In 1941 Malinovsky was forced to abandon

Dnepropetrovsk before the nazi advance; he later personally led the forces which recaptured the city. He beat off German attempts to relieve trapped German troops in Stalingrad in 1942, and was promoted to the rank of colonel general and given command of the entire southern front. While commanding the 3rd Ukrainian army in 1943-44, Malinovsky evicted the Germans from the southern Ukraine. In 1944 his armies drove into Bucharest, and in September, he signed the United Nations armistice with Rumania. He was promoted to the rank of marshal at this time. In Dec. 1944 he spearheaded the soviet drive into Hungary. Budapest fell in Feb. 1945, and by April the 3rd Ukrainian force had driven into Czechoslovakia. After the war in Europe, Malinovsky was sent to Siberia, where he commanded one of the soviet armies which invaded Japanese-held Manchuria in Aug. 1945.

Malta

Malta (95 sq.mi.) and Gozo (26 sq.mi.) are much the largest and most important of a group of islands situated in the central Mediterranean, about 58 mi. from the nearest point in Sicily and 180 mi. from the nearest point on the African mainland. Civilian pop. of island group: (1931 census) 241,621; according to a census of April 1946, based upon food rationing figures, the total population was 285,130 (including 540 British service personnel drawing civilian rations). Chief towns (1931 census): Valletta, including suburbs (cap. 51,898); Senglea, Cospicua and Vittoriosa (combined pop. 27,149); Città Vecchia or Notabile, including the adjoining town of Rabat (pop. 10,032). Language, Maltese; English and Italian also widely spoken. Under letters patent issued in 1936 English and Maltese (to the exclusion of Italian) became the official languages of the colony. Religion: Roman Catholic. Governors (with dates of assumption of office): Gen. Sir Charles Bonham-Carter (April 16, 1936); Lieut. Gen. Sir William Dobbie (June 17, 1941; he had been administering the government as officer in command of the Malta forces since the previous year); Gen. Viscount Gort (May 7, 1942); Lieut. Gen. Sir Edmond Schreiber (Sept. 26, 1944); F. C. R. Douglas (after July 10, 1946).

At the opening of the decade 1937-46, Malta was passing through a difficult phase in its political and constitutional development. The constitution of 1921 gave the colony responsible government in its domestic affairs. Imperial questions remained the concern of the imperial authorities, but in all purely Maltese matters the administration was conducted by a Maltese ministry, depending upon the support of a party majority in an elected legislative body. The system broke down after about 12 years' experience. Matters reached a point at which the British government felt compelled to intervene. Italian intrigues and encroachments, unchecked by the Nationalist party then in office, had been carried to intolerable lengths. Drastic action had to be taken. The constitution of 1921 was suspended in 1933 and subsequently revoked in 1936. A new constitution was introduced in 1939, framed on lines appropriate to a wholly nonself-governing colony. Full power rested with the governor, advised by executive and legislative bodies. Malta's progress along the path of self-government had received a decided check.

That was the position when World War II broke out in Sept. 1939. During the first few months of the war Malta did not find itself directly threatened; but the situation was entirely changed in the early summer of 1940 when Italy entered the war and the central Mediterranean became a first-line theatre of operations. Malta, lying within such close range of Italian territory, was highly

vulnerable to axis attack. The first air raid upon the island was delivered on June 11, 1940; and thereafter the assaults continued, almost without intermission, for the best part of two and a half years. Matters reached a climax in Feb. 1942 when the island was subjected to continuous attack and there were sometimes as many as 13 alerts in a single night. There was a series of heavy raids during the following April.

The worst of the campaign was over by the end of 1942; by that time it was estimated that about 16,500 tons of bombs had been dropped upon Malta, that about 25,000 buildings had been destroyed or damaged and that civilian casualties amounted to 5,146 (1,469 killed and 3,677 injured). Even in the early stages, the axis by no means had matters all its own way. Thirty-seven axis aircraft were brought down in raids during Jan. 1941, and 16 more were destroyed in a raid in the following March. The axis sustained a heavy defeat on March 10, 1942, when it was estimated that no fewer than 93 of its aircraft were put out of action.

Throughout the prolonged ordeal the spirit of the defenders remained unbreakable. Apart from the loss of life and damage to property caused by repeated air attacks, Malta suffered from other hardships and discomforts inseparable from a state of siege. The maintenance of its food supply became a matter of extreme difficulty. The convoy of supply vessels from the United Kingdom and elsewhere grew more and more hazardous an adventure. There were cases in which convoys suffered a loss of more than 50%. Nevertheless, the task of provisioning was successfully accomplished in the face of all difficulties, and the danger of starvation was averted. An admirable system of air-raid shelters, many of them out of the living rock, reduced civilian casualties to a minimum. Under the leadership of Gen. Sir William Dobbie and later of Lord Gort, the garrison, both British and Maltese, held out against every onslaught, and the morale of the civilian population never wavered. Their steadfastness and fortitude were officially recognized on April 15, 1942, when the British sovereign bestowed the George cross upon the "Island Fortress of Malta."

Under the stress of siege conditions the constitutional question receded into the background. But it re-emerged in the first half of 1943. The existing legislature, formed under the constitution of 1939, was due for dissolution in July. War conditions made it necessary to extend its term of service, and this extension led to a demand from all political parties in the island for some indication of the future intentions of the British government. In the light of their conduct in the day of adversity, the claims of the Maltese to resume control over their own affairs could no longer be contested. Italian intrigues, which had played so conspicuous a part in the events of 1933, no longer counted. On July 13, 1943, a categorical assurance was given in the British parliament that responsible government would again be conferred upon the colony after the conclusion of the war; and that, in the meantime, early steps would be taken to consult Maltese opinion as to the precise form of the future constitution.

A congress, convened with an object of setting up a national assembly to draft a new constitution for the colony, met in Malta on Feb. 10, 1944. Its proceedings did not advance very rapidly, and it was not until nearly a year later, Jan. 20, 1945, that a national assembly, consisting of 388 members representing all sections of the population of Malta, held its first meeting in the Hall of St. Michael and St. George in the Palace of Valletta. The assembly was confronted with many difficulties from the

outset, not the least of which was the financial position of the colony consequent upon the heavy material damage sustained during the siege. Later in the year the British government sent out a financial expert to investigate the finances of the local government. A free grant of £10,000,000 for purposes of restoration of war damage and the rebuilding of Malta after the war had been approved in the closing months of 1942. In the light of the financial expert's report, it became evident that this amount must be largely increased; and it was officially announced in July 1946 that the British parliament would be invited to provide a further sum of £20,000,000 for the same purpose. It was also announced that legislation would be introduced to enable Malta, after the introduction of responsible government, to continue to benefit from the provisions of the Colonial Development and Welfare act; and that a sum of £1,000,000 per annum would be allocated to the colony as its share of the financial benefits furnished by the British treasury under the act. A commissioner was also sent out from England to assist the local representatives in framing the new constitution.

The appointment of a civilian governor of Malta in July 1946 marked a departure from long-established practice. Prior to the war the British colonial empire included three "garrison" colonies—Malta, Gibraltar and Bermuda—where officers of high military rank were regularly appointed to the governorship. The practice was first broken in the case of Bermuda in Oct. 1941. Malta followed suit nearly five years later.

Manchester

City, municipal county and parliamentary borough, Lancashire, England, Manchester is 189 mi. N.W. of London, and 31 mi. E. of Liverpool. Pop. (est. 1945) 624,300 (1938 est., 732,900). During 1937–46, Manchester consolidated its position as the capital city of provincial Britain.

Parallel with some reduction in cotton business, there were more than corresponding increases in heavy and light engineering and chemicals; government departments and the British Broadcasting corporation chose Manchester as their regional centre; the university began to be the focal point of the north's education; the medical services, general, specialist and hospital, were unrivalled in the United Kingdom outside London, and cancer research at Christie hospital was of world importance.

In 1938 the centenary of the incorporation of the city was celebrated by an exhibition and commemorated by the publication of Dr. Arthur Redford's three-volume *History of Local Government in Manchester*.

War found Manchester able to produce aircraft (including "Manchester" and "Lancaster" four-engined bombers), radar equipment, guns, tanks, radio, penicillin, sub-oceanic oil pipeline, Bailey movable bridges, parts of the "Mulberry" invasion harbours, the insecticide DDT and parts of the atomic bomb apparatus.

In air raids 600 persons were killed and 40,000 dwellings damaged; the internationally famous Free Trade hall, the assize courts, and the ancient inns and buildings adjoining the market place and known as the Old Shambles were destroyed.

Initiating Manchester's policy of a planned community, the corporation's aim in 1946 was to build 25,000 houses in the succeeding five years. Of these houses, 7,500 would complete the satellite town, Wythenshawe, which would then have cost £54,128,000; initial development for 4,000 of them had been completed in 1946. Complementary plans provided for the construction of schools, shops and other facilities. This five-year plan also included the clearance of many of the 68,000 unfit houses in the congested part of the city: the cleared areas were to be redeveloped as new open standards to a master plan, and a second satellite town was proposed at Mobberley, 12 mi. from the city. Parallel to this immense housing program, the council was considering a major highway program to cost £2,800,000. In the replanning of the bombed areas, a site was reserved near the city centre for a combined court of law estimated to cost nearly £2,000,000. (Hu. L.)

Manchuria

"Manchuria" is a term used in western languages and Japanese, but without equivalent in either the Chinese or Manchu languages, to designate the territory traditionally called in Chinese the Three Eastern Provinces of Liaoning (formerly Fengtien), Kirin, and Heilungkiang, to which a fourth province, Jehol, was at times administratively attached. It is bounded on the N. by Siberia; on the E. by Siberia and Korea; on the S. by the Gulf of Peichihli and the Great Wall of China; on the W. by Chinese provinces and the Mongolian People's republic. Area, 503,143 sq.mi. (including approx. 100,000 sq.mi. in Jehol); pop. (Japanese figures of 1940), 43,233,954 (incl. Jehol). Minorities: 1,162,000 Koreans; 1,035,525 Mongols (among whom there continued to be a strong nationalist movement); 642,300 Japanese (largely repatriated to Japan in 1946); and a few thousand Manchus, long since culturally assimilated to the Chinese. The Chinese population contains (1) an element anciently established in South Manchuria and (2) immigrants, during the 20th century, from Shantung, Hopei and Honan. Largest cities, according to Japanese figures of 1940: Liaoning (Mukden), 1,135,801; Pinkiang (Harbin) 661,984; Changchun (called Hsinking by the Japanese), 544,202; Antung, 315,242. Capital: until

1931 Liaoning (Mukden); after 1932, Changchun. In religion, the majority of Chinese are conventionally listed as Buddhist and Taoist; but the ecclesiastical organization of both religions is weak, and the profession of faith of most laymen merely nominal. Lama Buddhism prevails among the Mongols. Moslems and Christians are small but important minorities, with Roman Catholics estimated at 130,000 and other Christians at 125,000.

The region as a whole was anciently inhabited by Chinese in the south, Mongols in the west, Koreans in the east and Tungusic tribes, from which the Manchus emerged as a political coalition in the 16th century, in the centre and north. From the Manchu conquest of China in 1644 until not long before the fall of the Manchu dynasty in 1911, the whole region (except for the Mongol areas) was treated as the private domain of the Manchu ruling house. It was then divided into provinces on the regular Chinese model. In the civil war and warlord period in China after 1911 these provinces were virtually autonomous, until the authority of the national government at Nanking was fully and voluntarily accepted in 1929.

In 1931 Japan invaded the territory. From 1932 to 1946, the Three Eastern Provinces (to which Jehol was annexed by a further conquest in 1933) were controlled by Japan through a nominally independent state which in 1934 was declared to be the "Empire of Manchukuo," under Pu Yi, heir of the Manchu line of emperors, who as a child had been deposed from the throne of China in 1911. Real control was in the hands of the commander in chief of the Japanese occupation forces, who was concurrently ambassador. Japanese held administrative posts in the government and entered all civil organizations.

In 1945, the U.S.S.R. entered the Pacific war, took prisoner Japanese troops estimated to number from 500,000

Armed Chinese guarding a police station barricaded with sandbags in Mukden, Manchuria, during March 1946. Tension between communists and nationalists was at a peak due to the delayed evacuation of Red army troops

Smoke, rising from a target in the city of Anshan, is visible through the nose of this B-29 Superfortress during a daylight raid on the "Pittsburgh of Manchuria" July 29, 1944

to 1,000,000 men, and captured Pu Yi. In accordance with the Cairo declaration of the United States, Great Britain and China, confirmed at Yalta by the United States, Great Britain and the U.S.S.R., and in 1945 by treaty between China and U.S.S.R., Manchuria then reverted to Chinese sovereignty.

Under Japanese control "Manchukuo" functioned as a pivotal position of the Japanese empire. Internal indoctrination and external propaganda were strongly anti-soviet, but in practice "Manchukuo" was used primarily to facilitate further encroachment in China, where countries like the United States and Britain had great interests. To an appreciable extent Japan succeeded, by advertising an anti-soviet policy in "Manchukuo," in weakening Anglo-U.S. resistance to the undermining of their own interests in China, although the U.S., under the Hoover-Stimson doctrine of nonrecognition of the fruits of aggression, which was endorsed by Britain, never officially recognized "Manchukuo." Japan retorted with measures restricting trade and investment, evading responsibility by asserting that these measures were enacted by the "independent" government of "Manchukuo." Relations with the U.S.S.R. were stormy. Soviet half-interest in the Chinese Eastern railway (the Chinese half-interest having been seized by the Japanese), was sold to the "Manchukuo" government, through negotiation with Japan, in 1935, on terms disadvantageous to the Russians.

There was chronic friction along the soviet frontier. In 1939, on the eve of war in Europe, soviet and Mongol forces inflicted a defeat on the Japanese at Nomonhan (Khalkha River), with losses greater than any ever previously admitted by the Japanese in any battle. The strength shown in this battle may have saved Russia from a double German-Japanese invasion. On the other hand, continuing Japanese hostility was shown by Japan's adherence to a

tripartite pact with Germany and Italy in 1940; but the seesaw dipped again when Japan signed a neutrality pact with U.S.S.R. in April 1941, and thus evaded joining Germany in the attack on Russia in June of that year. Under this pact the Russians undertook to respect "the territorial integrity and inviolability of Manchukuo," and Japan gave a similar pledge with regard to the Mongolian People's republic.

Soviet entry into the Pacific war was heralded by the denunciation of this pact in April 1945, on the ground that "Germany attacked the U.S.S.R., while Japan—Germany's ally—is helping the latter in her war against the U.S.S.R. Moreover, Japan is at war with the United States and Great Britain, who are the Soviet Union's Allies." Denunciation was followed, in August, by soviet (and Mongol) invasion of Manchuria, about two weeks before Japan's surrender to the United Nations. On Aug. 14, China and the U.S.S.R. signed a treaty, with several annexed agreements, which (1) restored full Chinese sovereignty and authority in the Manchurian provinces; (2) established joint Chinese-soviet ownership of the Chinese Eastern and South Manchuria railways (but not of other rail lines), for 30 years, after which the property was to revert to China without cost; (3) established a joint Chinese-soviet naval base at Port Arthur, also for 30 years, with ultimate reversion of all installations to China, without cost; and (4) established a free port at Dairen, under Chinese administration but with a soviet port manager,

appointed from the soviet staff of the jointly owned railway, this arrangement also to terminate in 30 years.

At the Moscow conference of Dec. 1945, it was announced that soviet troops would withdraw from Manchuria by Feb. 1, 1946, but this date was deferred on the request of the Chinese government. From the surrender of Japan to the end of 1946 there was a period first of confusion and then of uncertainty, with the U.S.S.R. accused of allowing Chinese Communists to enter Manchuria and acquire surrendered Japanese arms, and with the United States accused of intervention in Chinese domestic politics by transporting government troops to Manchuria. After sporadic fighting, sometimes intense, a strong government wedge was established in the broad plain in the heart of Manchuria, with considerable Communist strength in the north and west, and an undefined but strong "state's rights" movement among Manchurian Chinese throughout the territory. It seemed likely that local political ascendancy would depend on whether this local movement entered into coalition with the government (Kuomintang) or the communists.

During the soviet occupation there was extensive stripping of Manchurian industrial equipment, which was removed to Siberia. This, and undisciplined behaviour of soviet troops, stimulated anti-Russian feeling, traditionally strong in Manchuria, which apparently was somewhat offset, later, by resentment against the United States for extending the scope of civil war by bringing government troops to a territory which otherwise would have been able to make its own terms with the communists and with the government. (O. Le.)

Mandated Pacific Islands

See PACIFIC ISLANDS, MANDATED.

Mandates

By 1937 the mandatory system was working regularly. The annual examination of a report from each mandated area, supplemented by the presence at the mandates commission of a representative of the mandatory power, was carried out in close detail. The Permanent Mandates commission's discussions were published almost verbatim, and it was upon these minutes that the efficacy of the League of Nations supervision of mandatory government depended. During the last years before World War II, the affairs of the B and C mandate areas, *i.e.*, the African and Pacific territories, called for no outstanding remark. The ordinary custom of the mandates commission was to examine the reports of the year before its twice-yearly meetings, although the representatives of the mandatory powers might later add up-to-date information. The history of the areas in 1937 was thus discussed in 1938; they were examined under a series of subjects, such as administration, finance, health, education, labour conditions and native development.

In 1938 and 1939 there was a considerable discussion with the Belgian, British and French representatives on the position of the chiefs and native authorities in the central African areas. The commission, which tended to support the principle of indirect rule, questioned the British officials closely on the alteration of administrative districts, and on the efforts in the Cameroons to organize native authorities where, in one region, they met the impact of the immigrant Africans from abroad. The commission noted in 1938 that the Belgian system in Ruanda-Urundi, which employed chiefs mainly as the agents of

government policy, was not indirect rule in the full sense, and hoped it would be possible to invest the chiefs with the authority required by their functions.

The main subjects of interest in those years, however, were the emancipation of Syria and Lebanon and the civil war in Palestine. The French government signed a treaty with its two mandated areas in 1936, providing for a period of three years during which the administration should be handed over to the peoples of the countries. By 1938, changes in French politics had caused a withdrawal from the policy of emancipation and the French representative reported that there was small chance of the ratification of the treaties. Nonetheless, the administration had begun to hand over to the Syrians and Lebanese. The Syrians, partly because of centralist dogma, and partly as a reaction from the policy of France in dividing the country during the mandate period, began direct rule of regions such as Latakia, the Djebel Druse and the Jezireh. Local resentment caused French intervention. The mandates commission showed anxiety regarding safeguards for minority rights, after the mandate should have expired, and also regarding the position of the French troops which it was proposed to station in certain places.

Palestine from 1936 onward had been in a state of fluctuating Arab war against the British, though by 1939 the conflict was flickering out. The mandates commission had considered the Peel report, with its suggestion of partition and failing that of restriction of Jewish immigration and land-purchase to be combined with planned development of the country. This had been followed by the Woodhead report, stating that partition was impracticable. In 1939 the British government published a White Paper stating that Palestine was to be given democracy and, after ten years, independence; that in the meantime Jewish land-purchase was to be forbidden in the hill-country and restricted in part of the plains, and Jewish immigration to be limited to 75,000, to bring the Jews to a third of the population. To explain this policy, Malcolm MacDonald, the colonial secretary, attended the commission for a special discussion in June 1939. Palestine did not present the relatively simple case of all the other mandates, where freedom of conscience, and, in the A and B areas, the "open door" regime were the only provisions not directly concerned with native welfare and development.

In Palestine, the general covenant obligation to govern the country as a trust for indigenous inhabitants, and the special recognition of the independence of the Arab areas, came into conflict with the mandate provision for the establishment of a national home for the Jews. Faced with this conflict, which ran through the whole history of the mandate, some of the members of the commission had abandoned the attempt to preserve impartiality. Through a long discussion in 1939, MacDonald advocated the new policy on the ground that the Arabs of Palestine, like any other people who came under the mandatory system, were protected by Article 22 of the covenant. The British government, the mandates commission and the League council had long agreed that the obligations to the Arabs and the Jews were of equal weight. The national home for the Jews was now firmly established; it had already impaired the rights of the Arabs, though not to extinction. The time had come to carry out the covenant and mandate obligations to the Arabs. Under these treaties not only were they promised independence, but it was specifically provided that the national home must not prejudice their rights and interests and that Jewish settlement on the land must not injure their rights and position. The British minister received severe criticism from

some members of the commission. In its report to the council the commission said that the interpretation of the mandate differed from that which had been accepted in former years, but it could not decide whether the new policy was or was not in accord with the mandate; four of its members thought that it was incompatible with the mandate; three did not. This refusal to find on the constitutional point was later much misquoted in propaganda about Palestine.

Mandates and the War.—By 1939 the commission was already shrunk in numbers. Neither the Spanish nor the Japanese member was allowed to attend in that year. The commission met for its 37th session in Dec. 1939. It asked the mandatories to say how their areas were affected by the war, and whether they were involved as belligerents. But the answer to that question was never to be given, for in 1940 Germany overran western Europe and isolated Switzerland. The meeting of Dec. 1939 was in fact the final session of the mandates commission. The international status of the mandated areas was unaffected by World War II. Indeed the Atlantic charter, with its repudiation of annexationist aims, confirmed that status by implication. But the areas were inevitably involved in the war. Palestine became an army base. Syria and Lebanon, after it became clear that the Vichy government would allow axis forces to use its aerodromes, were invaded by British and Fighting French troops in 1941, under a promise of their independence after the war. Thereafter they suffered a troubled course of emancipation.

The French provisional government confirmed their independence in 1943, subject to French control of the local forces and the continuance of French troops on their soil. This the Lebanese and Syrians would not accept, and at the end of the war they had broken off relations with France. They became original members of the United Nations at the San Francisco conference of 1945, and at the first session of the security council in 1946 they appealed for a decision that the French and British troops still stationed in their countries should depart. Both France and Britain accepted the appeal, and the case ended with an agreement that the four states should arrange the evacuation among themselves.

The French mandated areas in Africa followed the lead of Governor Félix Eboué of French Equatorial Africa, and declared for the Free French. They formed part of the lines of communication of the Allies for the rest of the war, as did the British areas. The mandated Pacific islands suffered terribly in the war. Japan invaded and occupied the whole of the New Guinea group and Nauru. The islanders were subjected to ruthless oppression by the Japanese troops and many of them to equally ruthless air bombardment by the U.S. navy in the course of their recapture. The Australian campaign in New Guinea, helped by the native people, was one of the hardest-fought of the war.

Trans-Jordan was granted independence in 1946, and constituted as an independent Arab kingdom. Palestine ended the war in a condition still more critical than that of 1939: The Arabs had, in practice, accepted the 1939 policy; but the Jews resisted it. They embarked upon a policy of aiding illegal immigration. In 1942 the Jewish agency for the first time declared a policy of a Jewish state and army. Jewish nationalism was strengthened by the massacres in Europe, and Arab nationalism was confirmed by the organization of the Arab league. After the war, the Jews waged war upon the British both by assassination and by organized military action. British

attempts to obtain an agreed solution by impartial inquiry, by enlisting the help of the United States and by trying to hold a round-table conference were frustrated in 1946.

Trusteeship.—The future of the colonial peoples was discussed in official and unofficial circles among the Allies during World War II. The result was a consensus of opinion that the mandatory system, with some modifications, should be applied to the former mandated areas and to any colonial possessions conquered from Germany, Italy and Japan. The conference of San Francisco considered drafts prepared by Australia, Britain, China, France, the U.S.S.R. and the U.S. These showed signs of previous consultation, but varied somewhat, the Chinese proposals being the most detailed. After considerable discussion, two chapters on colonial government were included in the United Nations charter.

Chapter XI of the charter, the declaration regarding non-self-governing territories, embodied the Australian proposal. Under it, the United Nations recognized that the interests of the inhabitants of the colonial lands were paramount and undertook to ensure their welfare and to develop self-government. They also promised to send the United Nations information on the progress of these policies; an undertaking which Britain began to fulfill in 1946. This chapter amounted to a general pledge of enlightened policy; it did not put colonies under international control in any way. The trusteeship system was founded by chapter XII. This provided for the administration and supervision of territories defined as former mandated areas, colonies detached from the axis powers and any others which might voluntarily be added by their rulers.

The aim of the system was "political, economic, social and educational advancement of the inhabitants of the trust territories, and their progressive development toward self-government or independence as may be appropriate," respect for human rights and economic equality for all members of the United Nations. There was to be a separate trust agreement for each territory. For territories defined as "strategic areas" account was to be made to the security council, which might, however, ask the trusteeship council to supervise the provisions for welfare and development. Annual reports from the trustee would be examined by the trusteeship council, which might also receive petitions and visit the areas; it was to report to the assembly. The trusteeship council was composed of representatives of the trustee states, of nontrustee permanent members of the security council and of enough states elected by the assembly to make the number of nontrustee members equal to the trustees.

There was some difficulty in getting the system going, owing to opposition by the U.S.S.R. during the first assembly of 1946; this, however, was abandoned in the second part of the assembly held in October. At that session the trusteeship council was constituted. It consisted of Australia, Belgium, Britain, France and New Zealand, trustees respectively for New Guinea and Nauru, Ruanda-Urundi, Tanganyika and British Togoland and Cameroons, French Togo and Cameroons, and Western Samoa; and of China, the U.S.S.R. and the United States, non-trustee permanent council members, and Iraq and Mexico, elected by the assembly.

South Africa stated at the 1946 assembly that it proposed to annex its mandated area of South-West Africa. In reply to criticism, based upon the absence of self-

Mandated Areas in 1937

Pacific Islands under Japanese mandate	811	Dec. 17, 1920	C	Germany	Japan

Trans-Jordan became an independent Arab kingdom in 1946.

Syria and Lebanon were recognized by Great Britain and the Fighting French as independent republics in September and November 1941 and later by all the great powers.

government of the African inhabitants, South Africa conducted an inquiry and reported that the inhabitants both white and African desired union with South Africa. The assembly meeting of October refused this proposal by a large majority; whereupon South Africa declared that it would not accept the assembly ruling. During this period also the United States proposed to the security council that they should rule the islands formerly under mandate to Japan as a security area under sole trusteeship. The security council approved this proposal by unanimous vote April 2, 1947.

The charter provisions on trusteeship went further than the covenant of the League of Nations in providing explicitly for eventual self-government or independence. In all other respects they were more vague than the covenant, with its specific obligations on subjects such as land-tenure and labour conditions. The drafting of the charter, indeed, was confused. The texts of the trustee agreements to some degree remedied this defect.

The main difference in regard to administration was that the mandates (except in the French B areas in case of a general war) forbade the conscription of natives and the use of the areas for naval, military or air bases; whereas in the trustee territories the trustees might make bases, in conformity with world agreement for security, and might raise volunteer forces. This represented a change in the view taken of the morality of training backward peoples in modern methods of war. The trusteeship council had a new power, compared with the mandates commission: it might visit the territories. It had, however, completely altered in the nature of its membership, for members were to be representatives of states, an innovation due to U.S. and Russian policy.

With such membership, it would clearly be difficult for the body to exercise what was, in effect, a quasi-judicial function demanding complete independence of judgment. The success of the mandatory system was due to the detachment from governmental control of its members, who were not allowed to be in the employment of any government. (See also PACIFIC ISLANDS, MANDATED.)

Manganese

Wartime gaps in statistics for manganese production had been largely filled by the end of the decade 1937-46, but there were still insufficient data to permit an estimate of the world totals in 1943, 1944 or 1945. However, reported outputs in 1945 were very close to the totals from the same countries in 1943.

Even for the years in which world totals could be made, it was difficult to draw conclusions of much significance, beyond the fact that not only during World War II, but previously as well, world production was well in excess of consumption, and the surplus was being stocked for future emergency needs.

Manganese production in the United States during World War II was a repetition of the experience of World War I. Output was materially increased above the peacetime level but reached only a small fraction of the demand, as shown in Table II.

Throughout the world the shifts in production as shown in Table I could be correlated quite closely with the distance of the source from the centres of consumption and the resulting difficulty in maintaining adequate shipping capacity over the long distances involved. Cuba and Brazil, as the sources closest to the United States, showed the

heaviest increases, with Cuba favoured, not only because of the shorter supply route, but also because the worst of the submarine menace was avoided. Chile, more remote, still shared in the supply. Already handicapped by distance, India suffered still more when the Mediterranean was closed to traffic and shipments had to go around the southern point of Africa. With the Mediterranean closed Egypt practically dropped out of the picture, and water shipments were stopped from the soviet deposits. The Gold Coast continued to ship to Great Britain, but U.S. imports were not allowed to increase. The South African output was cut heavily by the loss of prewar shipments to Germany, some of which were replaced by exports to the United States. Many of these points are brought out even more strongly by the breakdown of U.S. imports by country of origin in Table II.

Prewar estimates of possible needs for manganese ore in the United States in the event of war were of the order of 1,000,000 long tons, or 1,120,000 short tons, but experience showed that this figure was too low by 30%. U.S. production reached its peak in 1944, when production was less than one-sixth of consumption. Actually the record was not even so good as it appeared from these figures, since an unknown but considerable proportion of the domestic output was below the grade demanded by industry and was not used. For the most part, the country was dependent on imports and remained so throughout World War II. By 1936 the consuming industry decided that the trend of world affairs indicated the probability of future needs for manganese ore on a scale larger than ever before, and imports were stepped up sharply, the surplus over current consumption going into stocks. In 1936 and 1937 imports were respectively 15% and 39% greater than in 1926, the former record year, and by 1941, the peak war year, imports were 116% greater than in 1926. Even after the peak of war imports had been passed, with successive declines in 1942-45 inclusive, the 1945 imports were 65% greater than in 1926.

U.S. production and consumption declined in 1946, but imports increased moderately. The figures covering the first three-quarters of 1946 were 107,700 tons for production, 810,161 tons for consumption and 1,187,835 tons for imports.

Adequate imports were maintained throughout the war period, not only for current consumption, but also to build up emergency stocks. The full extent of these stocks had not been reported, but at the end of 1945, after some ore had been declared surplus and turned over to the national stockpile, the Metals Reserve stocks still amounted to 1,119,158 tons, and producers and consumers held 513,063 tons. By Sept. 30, 1946, these stocks had risen to a total of 1,786,184 tons, an increase of only 153,963 tons, while production plus imports in the same time showed a surplus of 475,374 tons above consumption.

(G. A. Ro.)

Manila

Upon the inauguration of the commonwealth of the Philippines on Nov. 15, 1935, President Manuel Quezon decided that Manila was too crowded and busy as an industrial and commercial centre to serve properly as the capital city of the future republic. He therefore started to plan a new capital that would rise to the northeast of Manila about ten mi. away. All the important government buildings would be located there, including the capitol, the executive mansion, the supreme court and the state-owned University of the Philippines. Accordingly, many millions of pesos were appropriated in subsequent

years to purchase the necessary sites, to lay out and construct broad avenues and to finance the purchase and resale of lots to prospective home builders, as well as the construction of private homes and the necessary community utilities, like public schools and markets, in designated zones.

When Japan invaded the Philippines on Dec. 8, 1941 (Manila time), the construction of the new capital city was fairly well advanced. The main avenues had been built, the first four units of the state university were under construction and the foundation piles for the capitol had been sunk. The city, named after Quezon, had its own separate government.

The day before President Quezon and his cabinet sought refuge in Corregidor on Dec. 23, 1941, however, Quezon City was incorporated into the city of greater Manila, together with four other suburban towns, Caloocan, San Francisco del Monte, San Juan del Monte and Pasay. This step was taken ostensibly to insure better protection for the inhabitants of Manila proper and its environs.

The 1939 census had placed the population of Manila proper at 623,492. After the incorporation of the near-by towns, and as a result of the influx of thousands of families from the provinces into the city, the population of Manila was estimated at more than 1,000,000.

Manila was declared an open city by the U.S. military authorities within two weeks after the outbreak of the war. Except for the Japanese bombing of the shipping on the harbour and in the Pasig river and of the northern strip of the walled city (Intramuros), the city was relatively undamaged. When, on Jan. 2, 1942, two prongs of the Japanese invading columns entered the city from the north and south, they found the Port Area and the military barracks and installations, the warehouses and gasoline dumps on fire. Otherwise the city remained whole.

And so it remained throughout the Japanese occupation, except for two minor retaliatory raids by the U.S. air force before the fall of the Philippines, aimed at the Japanese military installations.

During the liberation of the Philippines starting in Oct. 1944 and ending with the recapture of Manila in Feb. 1945, the city suffered considerable destruction. The city was sacked and burned and blasted by the Japanese garrison troops that had been left behind with orders to massacre the inhabitants, destroy the areas they were defending and fight to the last instead of surrendering.

Taken by surprise, the Japanese troops, which had not expected the U.S. penetration from the north so soon, were driven toward the southern part of the city beyond the river. Some Japanese troops, however, were able to hold out in the concrete buildings in the commercial district along the northern bank of the river. There they were cornered, fighting to the bitter end, and in accordance with their orders, finally destroying the buildings.

South of the Pasig, the Japanese proceeded with their premeditated program of wholesale massacre and destruction. Infiltrating U.S. troops and Filipino guerrillas saved some of the outlying areas, and several thousand refugees were enabled to cross over to the U.S. lines. But the city's residential districts of Ermita, Malate, Paco, Santa Ana and Pandacan were almost completely devastated. Intramuros, the historic walled city with its numerous churches built during the three centuries of Spanish rule, easily the most picturesque spot in all Manila, was completely levelled to the ground when, upon the refusal of the Japanese troops to surrender, the U.S. troops decided to demolish the whole enclosed area with artillery fire.

It was subsequently estimated that 70% of the entire city was destroyed during the period of the liberation. This included the entire commercial district, the Port Area with its piers and harbour installations, the poorer districts of San Nicolas and Tondo north of the river, and in the south, the national and city government buildings, the state university plant and the better residential areas.

In two years following the liberation, very little new construction was done because of the shortage of necessary materials. The Philippine government was working on an ambitious plan to lay out the city anew, with fewer and wider avenues to take the place of the numerous small, winding streets dating from three centuries before, when all of Manila outside the walled city was a mere sprawling suburb. A City Planning office had been set up to make a blueprint for the new Manila, to rise out of the ruins. This blueprint involved abandonment of the earlier plan to move the national government out of the city proper, and the construction of the new government buildings in accordance with the new zoning plan.

A plan of this nature, involving the expropriation of a considerable area of privately-owned land, required the expenditure of many millions of pesos. In view of the fact that the Philippine government was without adequate funds to carry out even the most essential functions and services, it was doubtful whether the reconstruction of the city of Manila in accordance with the ambitious plans could be undertaken within five years.

In the meantime, the people of Manila had to repair such damaged structures as could be safely used for commercial and other purposes and to rebuild homes out of the burned-out rubble and such other materials as were available. It was inevitable that these temporary repairs and reconstructions should follow the old street plans—

a situation which might render even more difficult the enforcement of the new zoning and building regulations when permanent construction began.

The Escolta and Rizal avenue—the two major commercial streets—once more hummed with business and trade at the end of 1946. Temporary wharves—wholly inadequate for the purpose of unloading the ships calling at the harbour—had partially replaced the world-famous pier 7 and the other piers of prewar days. But the historic walled city of Intramuros—founded in the 16th century by the Spanish conquistador Miguel López de Legazpi—was definitely gone. The space it formerly covered was to be converted into an extension of the Port Area, and the mediaeval quiet and religious atmosphere of centuries was to be replaced by the clangor of gigantic cranes and locomotives. (C. P. R.)

Manitoba

Manitoba, central province of Canada and geographic centre of North America, lies within the Hudson bay watershed and is drained through the Nelson and Churchill river systems; it was established in 1870. The area is 246,512 sq. mi. (26,789 sq. mi. water); capital, Winnipeg, incorporated in 1873 (221,960). Other cities: St. Boniface (18,157), centre of culture for Canadians of French origin, west of Quebec; Brandon (17,383); Portage la Prairie (7,187). In 1946, there were 30 incorporated towns, 24 villages, 1 municipal district (Flin Flon in the northern mining area) and 115 rural municipalities. Population (1941 census) 729,744. In 1941, 44% of the population was urban; Canadian-born, 73%; density, 3.32 per sq. mi.; 67% of Protestant religion, 28% Catholic religion.

Lieutenant-governors during the decade were William J. Tupper, 1934–40 and R. F. McWilliams, who succeeded him in 1940. Premiers were John Bracken, Aug. 8, 1922–Jan. 14, 1943, and Stuart Sinclair Garson after that date. The unicameral legislature (elected Oct. 15, 1945) was the 21st and consisted of 58 members, one each representing the navy, army and air force for that assembly only.

During the decade 1937–46, the province of Manitoba continuously led the case for a readjustment of fiscal and jurisdictional relationships in the Canadian federation. It recommended changes that would align financial resources with constitutional responsibilities, in contrast with the outlook of the days when the constitution was created in 1867, and the subsequent growth of pools of wealth in certain industrial areas in Canada, not taxable by the regions in which this wealth originated. Its presentation resulted in the creation of the Royal Commission on Dominion-Provincial Relations. Subsequent dominion-provincial conferences were unsuccessful in reaching agreement on recommendations, and later proposals of the Canadian government in respect to fiscal and social security programs likewise were not unanimously acceptable by the provinces. In 1946, however, agreement was reached on a minimum basis between Manitoba and the Canadian government and certain other provinces whereby the Canadian government agreed to pay certain sums in lieu of provincial income and succession duty taxation.

Early in the period, tentative advances were made by the government of John Bracken to establish a nonpartisan government, to develop a less rigid party aspect to the business of government, to provide a united party front on behalf of Manitoba's case for fiscal and constitutional ad-

justments in the Canadian confederation, and (when coalition was accomplished in 1940) to establish a union of political forces to enhance Manitoba's participation in the war effort. A coalition government was established in Oct. 1940 with representation in the cabinet from the Liberal-Progressives, Conservatives, Co-operative Commonwealth Federation and Social Creditors. The Co-operative Commonwealth Federation withdrew and formed the official opposition when John Bracken left the Manitoba government in 1943 to take the leadership of the National Progressive-Conservative party.

Local government passed through transition from a financial crisis caused by depression relief costs of the preceding years and consequent reduced tax payments, to a position of budgets operating on a cash basis with reserves. In 1946 plans of a regional method of assessment and equalization were presented to municipal officers, the purposes of which were to create a new assessment with equalization spread over greater areas and with resulting co-ordination and efficiency.

The economic record of the decade, generally, was one of rising prices for increasing production and the expansion of trade following a period of drought, depression and agricultural surpluses. The year 1937 marked the turning point in Manitoba and the agricultural economy of the Canadian plains and prairies. The experiences of the previous years had emphasized the need for diversification within the agricultural industry and an increased diversification within the total productive life of the province. A sugar beet industry within the Red River valley was started in 1940 with government guarantees which were not required. After experimentation, a pilot plant for processing flax was created at Portage la Prairie in 1945. A co-operative vegetable oil plant, processing sunflower, soybean and rape seeds, was established at Altona also in 1945. In 1937 a muskrat development scheme for northern Manitoba was started, which by 1946 was well established with additional areas in the central part of

the province, and in 1944 this was supplemented by a trap-line control system for wild fur conservation and balanced production. Fish catches doubled with quadrupled values in the ten-year period. A second reaction from the depression years was the recognition of the need to understand more completely the economic and social life in Manitoba. Consequently, under government guidance and support, there was an intensive self-analysis during the decade by those qualified within the province, assisted by professional assistance from without.

The ten-year period was distinguished by this research, which began with the preparation and presentation of briefs to the Royal Commission on Dominion-Provincial Relations and benefited by the guidance of A. R. Upgren, Jacob Viner and Alvin Hansen of the United States. Subsequently there was established an Economic Survey board, under C. B. Davidson and Dr. H. C. Grant, which supervised the preparation of 24 reports in 1938 and 1939 dealing with every phase of the natural resources, climate, soils, employment and unemployment, education and finance. A Western Farm Marketing conference was held in 1938 which dealt with agricultural policies and price levels. Later, a joint study by the staff of the University of Manitoba and University of Minnesota was conducted on the similarities of economic developments in both areas. The crisis of the city of Winnipeg arising out of the relief problems of the depression, and the basic structures of government utilities, was studied and reported upon by commissions headed by Dr. H. Carl Goldenberg of Montreal. A special committee reported upon the establishment in Manitoba of a land court; another upon crop insurance. In 1941 public health in Manitoba and in Winnipeg was studied by the American Public Health association, and from this report a health and welfare program was adopted within both jurisdictions.

In the provincial sphere, a complete health plan was

established with creation of rural health units for the prevention of disease, diagnostic facilities for the medical profession, medical care for all citizens by payment of fees in advance, and hospitals provided for through the creation of hospital districts. In 1946, 11 health units were in operation, comprising 32 municipalities with a total population of 207,131. One hospital district was operating and six others were awaiting organization. In 1937 and subsequent years Dr. F. W. Jackson, deputy minister of health and welfare, recommended premarriage medical examination; on Oct. 1, 1946, this became law. In 1942 the adaptation of farm electrification within Manitoba was reported upon by a commission under the direction of Dr. Emerson Schmidt; from these recommendations a provincial-wide development was undertaken, with original plans for 5,000 farms a year. In 1945 and 1946, however, shortages of material and experienced manpower retarded the accomplishment of the annual program. Five areas in Manitoba were prepared for land settlement by the use of power machines, in contrast with the original slow and harsh pioneer methods, with veterans of World War II being given priority.

A special research project on labour-government-management relations was completed by W. F. Loughheed in 1943. In 1943 and 1944 a special committee of the legislative assembly, together with professional assistance, completely surveyed the administrative and curricular needs of the educational system and emphasized in its report the advantages of a larger unit of school administration, the need for equalization of school financial support, a special type of school able to provide alternative types of courses, and composite high schools with technical and agricultural courses, and a survey of adult education. In 1946 two regions recorded opinions upon the larger unit of administration, the Dauphin area deciding affirmatively. A Royal Commission on Adult Education surveyed the subject under the chairmanship of A. W. Trueman, with Harold A. Innes of Toronto, John Grierson, former head of the Canadian Film board, J. J. Deutsch, economist of the Canadian government and Frances MacKay, director of women's work in the Manitoba department of agriculture.

Plans for the transition in the postwar era were started early with the creation of the Postwar reconstruction committee comprising the deputy ministers of departments of government, advised by W. J. Waines, and assisted by numerous academic, professional, technical and business leaders of the province. The reports prepared by this organization, and all other postwar plans prepared in Manitoba, were later studied for purposes of co-ordination by a special group of representative citizens headed by W. J. Parker, president of the Manitoba Pool Elevators. All projects studied, including those already mentioned in this article, were given a priority based on need for employment and need of the communities of the province. Reports included: Manitoba Agriculture and Prairie Farm Rehabilitation; Industrial Utilization of Plant and Animal Products; South-Eastern Manitoba Land Classification, Land Use and Settlement; Town and Country Planning.

Mannerheim, Carl Gustav Emil von

Marshal Mannerheim (1867–), Finnish army officer, was born June 4, 1867, at Louhisaari, Finland. He studied at Russian military schools, at the Hamina Cadet school and at Nikolaev Cavalry school in St. Petersburg. During World War I Mannerheim served with the tsarist armies. At the outbreak of the revolution in 1917, he left his command and returned to Finland, then in the throes of civil war. Mannerheim was made commander in chief of the White army and, enlisting German aid, quelled Finnish and Russian communists. On Dec. 12, 1918, he became regent of Finland, holding this office until the establishment of the republic in June 1919, when he was defeated in the presidential elections and retired from public life.

Recalled in 1931 to head the Finnish council of defense, Mannerheim reorganized Finland's armies, planned the Mannerheim line of fortifications strung across the Karelian isthmus, and was made a field marshal in 1933. He led the Finnish troops in the winter war against soviet Russia in 1939-40, and continued as supreme commander of Finland's armies when his country joined Germany in the war against the soviets in June 1941. On Aug. 1, 1944, Mannerheim was made president with authority to negotiate an armistice with the U.S.S.R. Following several disputes with the soviet union, he resigned in March 1946.

Manuilsky, Dmitry Zacharovitch

Manuilsky (1883–), Ukrainian statesman, was the son of a village priest. He studied at Petrograd university and became active in the revolutionary movement. He was arrested for participating in the Kronstadt revolt, and was exiled from St. Petersburg in 1906, but escaped and fled to France. After the outbreak of the revolution in 1917, he returned to Russia, joining the Bolsheviks. After the death of Lenin, Manuilsky was named to membership in the central committee of the Communist party, and in 1924 he was a member of the comintern.

In 1944, Manuilsky was appointed foreign commissar for the Ukraine Soviet Socialist Republic and in 1945, he represented that state at the United Nations conference in San Francisco, and later at sessions of the U.N. assembly and security council.

At the 21-nations peace conference in Paris in 1946, Manuilsky announced his intention of filing with the U.N. security council charges that Greece was endangering the peace in the Balkans, adding that Britain was the "principal factor" in aggravating the situation.

At the peak of anti-soviet sentiment in the United States, Manuilsky charged Sept. 10, 1946, that the western nations were waging an "aggressive war of words" against the soviet union and likened the method used in the alleged attacks to the technique employed by Joseph Goebbels.

Mao Tse-tung

Mao (1893–), Chinese Communist leader, was born in the village of Shao Shan in Hsiang T'an county of Hunan province, son of impoverished peasants. After sev-

eral years of formal schooling in Changsha, he joined Sun Yat-sen's revolutionary army in 1911; later he resumed his studies and entered the Hunan Normal school, receiving his degree in 1918.

Mao was present in 1920 at the Shanghai conference at which the Chinese Communist party was formed and in 1922 he was secretary of the party's branch in Hunan province. He helped organize the peasant membership of the party and in 1927 he led the Communist uprising in the Chingkanshan area. The following year, Mao became political commissar for the Chinese Red 4th army and in Dec. 1931, he was elected chairman of the first All-China congress of soviets.

Soon after the outbreak of war with Japan in 1937, Mao's forces occupied a large part of northwest China despite Japanese infiltration. By 1942, however, Chungking's military forces blockaded the areas in which the Chinese Communist guerrillas operated. Chiang's demands in 1943 for dissolution of the Chinese Communist armies and political organizations were rejected by Mao.

After the surrender of Japan, Mao and Chiang began personal negotiations, in the late autumn of 1945. While they failed to agree on military and administrative unity, they emphasized in a joint communiqué issued Oct. 11, 1945, that civil strife must be avoided. However, civil war

between the two factions did break out and on June 24, 1946, Mao charged that U.S. aid to Chiang's government was the "fundamental cause of the outbreak and propagation of the civil war."

Maple Products

The "sugar orchard" industry had been declining steadily in the United States for three decades down to 1937 and descended to a new low in 1945, the most disastrous year since records had been kept by the government. The number of trees tapped was 17,053,000 in 1918, with an output of syrup and sugar (in terms of sugar) of 38,161,000 lb. By 1937 the number of trees had declined to 11,677,000 and the output to about 8,184,000 lb. of sugar.

There was a considerable loss of trees in New England from the hurricane of 1938. Trees were also being reduced in number by natural causes. The very poor crop of 1945 was the result of freakish weather and labour shortage. Sap started to run in February during an unusually warm spell. Producers were not prepared for early tapping and were handicapped by the deep snow. Warm March weather started the buds on the trees and brought the run of sap to an early and abrupt end. This later sap was "green," spoiled easily, had low sugar content and spoiled the quality of the syrup. The price of syrup ad-

Oxen hauling a tank used to collect sap from maple trees at Marlboro, N.H. New England farmers worked hard to meet increased demands for maple sugar and syrup during the war-created sugar shortage

vanced from \$1.61 per gal. in 1937 to a top of \$3.04 in 1944. At the same time the price of sugar rose from 28.9 cents per lb. to 47.4 cents.

Canadian production of maple sugar averaged about 28,000,000 lb. in the prewar period. About 24,000,000 trees were tapped each year in Canada, and one-fourth of the crop was exported to the United States. Imports in 1944 amounted to 3,883,000 lb. of sugar and 1,798,000 lb. of syrup. (J. C. Ms.)

Margarine

The serious shortage of fats for human consumption, particularly butter, brought about a constant increase in the production of U.S. margarine during the decade 1937-46. The output had reached a total of 369,484,000 lb. in 1920, as reported by the bureau of internal revenue, and civilian consumption was estimated at 3.4 lb. per capita. This high rate of production was not reached again until 1935, when it suddenly increased to 381,631,000 lb., but the civilian consumption was only 3 lb. per capita. The shortage of vegetable oils, particularly cotton seed and foreign vegetable oils in 1938 and 1939 reduced production to 300,856,000 lb. in 1939. Quotas of raw materials were set in late 1942, and production of margarine for civilian use was limited to 590,000,000 lb. in 1943, 569,000,000 lb. in 1944 and 471,000,000 lb. in 1946. Not until 1946 did manufacturers utilize their full quotas. Civilian consumption was estimated at 4 lb. per capita in 1945 and a little less for 1946. The raw materials used in the manufacture of margarine in 1945 consisted principally of vegetable oils as follows: cottonseed oil, 253,997,000 lb.; soybean oil, 206,642,000 lb.; peanut oil, 10,215,000 lb.; and corn oil, 9,174,000 lb., or a total of 480,166,000 lb. of all U.S. vegetable oils. Before 1942 large amounts of imported vegetable oils were used (105,802,000 lb. in 1938) but these were no longer available after 1942. Consumption of animal fats ranged from about 20,000,000 lb. in 1937 to 37,691,000 lb. in 1942. Milk was used to the amount of 105,002,000 lb. in 1945 and other materials amounting to 127,052,000 lb.

Margarine was exported in small quantities until 1941, when lend-lease was established; after that time most of the exports were shipped to the British overseas services. The U.S. military forces used about 14,000,000 lb. for feeding prisoners of war in 1945; 7,000,000 lb. was shipped to the soviet union and 2,000,000 lb. to France. The Red

Cross bought 13,000,000 lb. in 1944 and 4,000,000 lb. in 1945, mostly for food parcels for Americans held as prisoners of war. Only small amounts were used for the United States military forces. The average price of margarine was only about half that of butter. During 1945 uncoloured margarine averaged 21.1 cents per lb. compared with 50 cents for butter. United States consumers showed little disposition to substitute margarine for butter even under the most severe rationing. Some agitation for the repeal of the federal tax of ten cents per lb. on coloured margarine was heard without legislative action. The use of coloured margarine increased somewhat but in 1945 still amounted to only 4% of the total amount consumed.

State taxes on margarine in 20 states varied from 5 to 15 cents per lb. in 1946. After 1938 state taxes were removed in Alabama, Nebraska, New Mexico and Oklahoma. Federal taxes continued unchanged after 1931, at ten cents per lb. on coloured margarine, ¼ cent per lb. on uncoloured. Imported margarine was subject to a duty of 14 cents per lb. and a stamp tax of 15 cents per lb. paid by the importer. (J. C. Ms.)

Production of Margarine in the United States, 1937-46
(In pounds)

1937	397,381,000	1942	425,749,000
1938	385,233,000	1943	614,144,000
1939	300,856,000	1944	588,184,000
1940	320,402,000	1945	613,279,000
1941	367,587,000	1946	550,000,000*

Marianas Islands

Little known to Americans before World War II, the Marianas by 1946 had assumed considerable importance to the United States, primarily for their strategic military

A U.S. marine patrol on Saipan discovered this frightened Japanese family crouching in a cave during the fighting which took place on the island in June-July 1944

value but also because they furnished landing and refueling facilities for air travel radiating in all directions.

After the principal islands of the group were taken by the U.S. from the Japanese in the summer of 1944, they quickly became powerful bases for air and naval operations against Japan. Hardly an acre of ground was left unused on Saipan and Tinian by occupying forces; while Guam, which the United States had not fortified before the war and which was garrisoned with less than 500 officers and men when the Japanese took it December 12, 1941, quickly became the site of five large air fields as well as a major naval base and a staging area for ground forces. These three islands were crisscrossed with roads, and Guam became advance headquarters for Fleet Admiral C. W. Nimitz, commander in chief of the U.S. Pacific fleet.

The taking of Saipan and retaking of Guam were bloody operations; the Japanese had prepared defenses deep in the rock cliffs, especially on the island originally held by them. Following intensive bombing and shelling by a naval task force of all important islands in the chain, U.S. assault troops went ashore on Saipan June 14, 1944. Because the island had been built up as the principal fortress guarding the southern approaches to Japan and as a major supply base for Nippon's temporary holdings in the South Seas, defending forces put up suicidal resistance.

Organized resistance was declared ended July 8, 1944, after the defenders had lost virtually all their air force in the island group plus most of their remaining carrier-based air arm. Eventual Japanese troop losses in the Marianas were 52,206 killed and 2,659 captured; while U.S. losses were 4,683 killed, 20,839 wounded and missing. By far the greater percent of U.S. wounded were returned to duty within a few weeks.

The victory for the U.S. was rated one of the most significant of the war in the Pacific, causing the fall of the Tojo cabinet at Tokyo.

Beachheads were established on Guam by U.S. forces on July 20, 1944, and organized resistance was declared ended Aug. 9, though several thousand Japanese troops were killed and captured in the jungle and coral-stone caves during the months following. Total Japanese killed on Guam to Dec. 9, 1944; 17,436; total captured, 512. U.S. losses were approximately 1,300 killed, 6,000 wounded and 300 missing.

Civilians on the island, largely Chamorros, who, almost without exception, remained intensely loyal to the U.S. through the Japanese occupation, suffered some cruelty at the hands of their captors.

Schools, churches and some villages, as well as the principal city, Agana, were largely destroyed by bombing and naval fire of U.S. forces in the battle to retake the island.

Almost immediately after organized resistance ceased, however, the island administration—which also became the administration for all the Marianas—began rehabilitating the civil population (estimated at 23,000). Health programs were instituted, a hospital was given the Guamanians, replacing one destroyed during the fighting; schools were re-established in the English language, the school buildings and churches furnished by the U.S.

Approximately 165 teachers, all natives, were in these schools in April 1946, under a native superintendent appointed by the naval commander (governor of the islands). The Guam congress also had been reconstituted, each district electing its officials.

Several thousand Guamanians were employed by military and naval establishments, while an agricultural rehabilitation program, supported by U.S. government funds,

A Liberator of the U.S. 7th army air force taking off from its base in the Marianas to raid Truk and other by-passed Japanese islands in May 1945

helped most of the remaining adults to find immediate employment. Still others engaged in handicrafts, selling their wares at a handsome price to soldiers and sailors. The objectives of the agricultural program were to restore war-damaged coconut plantations, to convert new acreage from jungle into farm land, and to develop dairying and livestock and new types of commercial and food crops.

The Japanese had developed agriculture and industry in the other islands of the Marianas much more highly, before and during the war, than the development on Guam. In 1937, Saipan exported \$6,000,000 worth of sugar, while Guam's total exports were valued at only \$228,229. The small island of Rota had a sugar mill, a railroad and a phosphate plant.

By unanimous vote of the United Nations Security council on April 2, 1947, the United States was given sole trusteeship over the former Japanese mandated islands in the Marianas. (See also GUAM; PACIFIC ISLANDS, MANDATED.)

Marie, Queen

Queen Marie of Rumania (1875–1938), was born at Eastwell Park, Kent, in England on Oct. 29, 1875, the eldest daughter of the duke of Edinburgh, Queen Victoria's

second son. On Jan. 10, 1893, she married Prince Ferdinand of Rumania, and as his consort was crowned queen of Rumania on Oct. 15, 1922, reigning until Ferdinand's death on July 20, 1927. Queen Marie visited the United States and Canada in 1926. After King Ferdinand's death she took little part in public life. She died at Pelishor castle, Sinaia, in Rumania, on July 18, 1938.

Marine Biology

In spite of World War II which raged through most of the decade 1937-46, a few marine scientists in some of the more fortunately situated stations throughout the world carried forward research and conducted explorations that added richly to the store of useful knowledge concerning the sea and its living organisms. While considerable routine work found its outlet in the usual published reports and followed the more or less stereotyped descriptive form of previous years, this interval in retrospect seemed unique in that much of the outstanding research resulted from new methods and techniques applied to the solution of the older problems. Some of the more important accomplishments of marine biologists are summarized under each of the several subheadings.

Technical Research.—Well to the forefront came the practical use of the "bathysphere,"^{1,2} a large, heavy, hollow, spherical steel ball in which a scientist could descend to various depths of the sea. There were seen living forms never before viewed by the eyes of man. Among the many lilliputian organisms described, perhaps the most interesting were comparatively small, brilliantly coloured deep-sea fishes. These were characterized as having proportionately very large heads from which protruded protoplasmic stalks bearing luminous organs. The deepest descent recorded was in a limited area of the ocean in close proximity to Bermuda where the bathysphere was lowered to a depth of 3,028 ft. After the forms collected by this means were studied and catalogued, there were found representatives of approximately one-third of all known species of sea-life. The principle of the bathysphere was pronounced "the greatest invention since the diving suit."³

At about the same time⁴ at the Marine Biological station (Woods Hole, Mass.), scientists discovered that sea-urchin eggs, when subjected to great centrifugal force (*i.e.*, 10,000 x), were broken into nucleated and non-nucleated halves. Subsequently on being treated with parthenogenic reagents, the non-nucleated halves underwent cleavage and developed into blastulae, a circumstance which profoundly altered contemporary thought in embryology. It was thought that only cells with the intact nucleus were capable of reproduction and development.

Somewhat later (1939) a deep-sea dredge of new design⁵ was successfully used to obtain mud-core samples ten ft. thick from the ocean floor two mi. deep (Atlantic). From studies of these core-samples, several conclusions were reached; evidence was abundantly clear that there were four ice periods and five warm periods represented; that the magnetic pole had wandered quite widely as evidenced by differently-directed magnetic particles in the different

sedimentary strata; and that strange gigantic shelled animals dominated one era. This device⁶ used in another way furnished data on the rate of sedimentation and age of the various mud-strata. From differential amounts of radium in the core from the deeper to the more superficial layers it was estimated that an interval of approximately 1,000,000 years was required for the deposition of a core 10 ft. thick.

The development of automatic depth-recorders (echo-sounding) and position-finding at sea⁷ contributed greatly to the knowledge of subterranean topography along the shores of the western hemisphere in both the Atlantic and Pacific oceans. From this mass of data it was concluded that the sub-sea configurations are quite like those of the land areas above sea-level; that the sub-continental slopes studied showed definite signs of erosion; that the submarine mountains were weathered and were not mountains of deposition as some had thought; and that the sea level was in earlier times at least 10,000 ft. below its existing level.

One of the most useful devices applied in marine studies came with the development and perfection of the under-sea camera⁸ with a special automatic "trigger" mechanism which activated both the photoflash bulb and the film exposure. This candid camera enabled biologists not only to secure pictures of rare bottom forms, but to secure exposures showing ecological habitats of both marine plants and animals never before observed. A study of exposures over the Georges Banks fishing grounds, just off the New England coast, showed the area literally alive with crabs, sea snails, starfish, sea urchins, sand dollars, deep-sea scallops, tube-building worms and sponges as well as much sea vegetation. These rich biological associations implied that the basic organic synthesis was performed by the pelagic phytoplankton—probably diatoms in the first place, which in turn were consumed by the zooplankton—the copopods; the latter together with others served as the attractive source of food for the commercial fishes taken in such numbers about the Banks. Beyond the use of this in the hands of biologists, geologists and oceanographers⁹ employed it as a material aid in interpreting the effect of tides and currents upon the sea-floor in the formation of "sand-ripples" and submarine canyons. The device also found wide application in diving operations preliminary to actual salvage operations.

Two very practical techniques resulted from the exigencies of World War II. In 1943, the royal Canadian navy¹⁰ first made use of a discovery of "pink pills" as a preventative of, and a cure for, seasickness. In the same year the United States Naval Medical Research institute developed a chemical briquette about the size of a candy bar which was a very successful and efficient "sea water de-salter." Subsequently these briquettes were included in the life-saving packets of navy vessels and overseas planes.

Finally, the radar principle¹¹ met with wide and remarkable success as an electronic navigator on many combat ships of Allied nations during the latter days of the war. Experiment testing sets were successfully employed by the U.S. maritime service in 1945, and gave promise of great usefulness for vessels engaged in scientific exploration of the seas.

Surveys and Expeditions.—During the earlier years of the decade, many surveys and expeditions were completed by scientific and national organizations. These were varied in scope and purpose and not easily evaluated. Several Pacific expeditions of considerable duration were com-

pleted off the Central and South American coasts. One sponsored by the American Museum of Natural History¹² collected marine specimens and carried out a research program over an interval of four months off the coast of South America. A similar study was conducted by the sixth Allan Hancock Pacific expedition along the Central American coast. Many rare and unnamed specimens collected by this and a subsequent expedition (the seventh) were studied and donated to scientific institutions along the Pacific coast. A long series of expeditions¹³ under the direction of the U.S. coast guard, known as the Marion and General Greene expeditions to Davis straits and the Labrador sea, was completed. A comprehensive report was published as part two of *Physical Oceanography* by the U.S. printing office. Shortly thereafter, the second Eastern Pacific Zaca expedition¹⁴ was completed. In these studies emphasis was placed upon oecological habits and colour patterns of marine forms rather than upon their structural and taxonomic positions. Much scientific data as well as colourful facts were reported in the book, *The Zaca Venture*.¹⁵

Concerned with the Arctic and Antarctic expeditions, three important reports were made; two under the sponsorship of the Linnean society of London¹⁶ as the result of the expedition of the "Nautilus" to the Arctic waters. One was an extensive monograph on the *copopoda*, and the other concerned the *appendicularians*. It was reported¹⁷ that during the ice "drift" from the north pole to the coast of Greenland, U.S.S.R. scientists accumulated much data on depth soundings, plankton studies, sub-ice water flow and organic life. So far as was known, however, these observations did not find their way into scientific literature of the decade.

The U.S. geophysical expedition¹⁸ to the Southwest Pacific, northeast of New Zealand, resulted in a physical and biological survey of an area of the ocean which was estimated to cover approximately 4,500,000 sq.mi. Most of these data, however, concerned physical features; about the same time Cambridge university, Cambridge, England, completed a biological expedition to Jamaica. The British Museum released part one of its studies of the Great Barrier reef which dealt with studies on rock-destroying molluscs, zooplankton, copopods and crustaceans of that region. The British Museum also released the report on the John Murray expedition (1933-34) dealing with oceanographic and biological surveys of the Indian ocean and the Gulf of Aden. A new oceanographic vessel, the "Culver," was sponsored jointly by the Development Commission of Great Britain and the Royal Society of London and entered upon a long term study of the Gulf stream. The icebreaker "Sedor" (1940) after a drift of 27 months in the Arctic, returned to Murmansk and set out again, sponsored by the geographical department of the U.S.S.R., to explore the Kara sea.

In 1941 the U.S. National Museum¹⁹ issued the sixth volume in the series of the Henry W. Fowler's studies of the fishes collected by the "Albatross" dealing mostly with the primitive fishes of the Philippine Islands. This volume of some 900 pages proved of great value to the systematist as well as to the lay reader.

Reports from the Richard E. Byrd expedition to the Antarctic, covering a three-year period (1939-41), included observations of the aurora, ice formations, ornithological

studies, new details of the Antarctic map, volcanic areas and other topographical details.

Marine Stations and Research Ships.—Three new marine stations were established in 1937; two of them by the U.S.S.R. Academy of Sciences in northern Russia and the other by the British government at Bermuda in the Atlantic. The Bermuda station was dedicated to the study of the pulses of the Gulf stream as these affect marine life. The research ship "Culver" was commissioned to the Bermuda station by the Royal Society of London at the same time (July 16, 1937) that the new ship "Atlantis," of the Woods Hole Oceanographic institute, entered into a joint research program of considerable magnitude. In the same year the British admiralty²⁰ commissioned the "Research" to finish the work of the "Carnegie" which was destroyed by fire in 1929 at Spia, western Samoa. However, much of the earlier data gathered by the "Carnegie" was in safe-keeping and two important contributions, data for which was gathered in 1928-29, appeared in 1943,²¹ *Biology III* and *Biology IV*, published by the Carnegie institute. The Danish government also commissioned a new ship, the "Dana," at a cost of approximately \$500,000 (1,000,000 krone) equipped with all modern devices for scientific research of the sea.

In midsummer 1938 the 50th anniversary of the Marine Biological laboratory at Woods Hole, Mass., the oldest institution of its kind in America, was celebrated. The scientific accomplishments in the field of marine biology throughout the half-century and succeeding span of years were reviewed in a volume²² published in 1944 by its long-time director.

Duke university, Durham, N.C., established a new marine station at Beaufort, N.C., in 1938, and in the following year the South Wales government established a new biological research station at Cronulla. Three new U.S. bureau of fisheries laboratories were established in the same year; one at Pensacola, Fla., on the site of the quarantine station on Ballast, Rock Island. Another was established at the crossroads between North and South America in Puerto Rico, where research concerned advanced methods of fish canning and marketing. A third station was established at Milford, Conn., especially adapted to the research on the propagation of oysters and other commercial molluscs. The marine biological station at Plymouth, England, was seriously damaged by bombing early in 1941, but was later repaired and its research program continued. Limited use of motor boats was also renewed. A similar situation was experienced by the Naples marine station and aquarium.²³ In 1943 the buildings were extensively damaged, but even more unfortunate losses were the long-time specimen collections, the library books and separates. However, in less than a year after the withdrawal of the German troops from Italy the station was revitalized and the research program was re-established by subsidies subscribed by the Royal Society of London.²⁴

Marine Zoology.—In 1937 a most comprehensive study of the salinity and temperature fluctuations of the English channel covering a 25-year interval was released by the

University of Agriculture and Fisheries of Great Britain²⁵ concerning many factors affecting the life of marine organisms in the oceans of the world; two voluminous reports were also issued by the Permanent Council for the Exploration of the Sea.²⁶ These studies concerned rheotaxis, geotaxis, photaxis, habitats and responses of sea animals. Several scientific discoveries of more than ordinary interest were reported concerning life histories and adaptations in fishes. In the matter of protective coloration,²⁷ an exhaustive series of experiments on marine fishes was reported before the National Academy of Sciences. It was concluded from the experiments that fishes with the most perfect adaptive mechanisms suffered least from predatory foes; thus the "protective coloration hypothesis" of the scientists was strongly upheld.

A systematic study was made of the so-called sea horse (*Hippocampus*),²⁸ a fish constituting a curious biological anomaly wherein the male of the species gives birth to the living young. The female places unfertilized eggs, a few at a time, in a pouch-like sac of the male, where in a manner yet unexplained by science at the end of the decade, they are fertilized and undergo development. Some facts²⁹ were reported concerning the rate of growth and number of moults of the lobster. At one year of age it was only 2 in. long and replaced its outside covering (carapace) 16 times; when 10½ in. long it had discarded its old coverings 30 times. A comprehensive report was completed on the marine fauna of the Bristol channel³⁰ concerning Amphipoda, Porifera, Coelenterata and fishes. These data supplemented surveys previously made by the University of Liverpool, England.

From an extensive study of the fishes taken in the brackish waters of the Panama canal³¹ it was deduced that many species found only in the Atlantic migrated into Gatun lake, while others represented typical Pacific ocean forms. In all, representatives of 159 species were identified. A somewhat similar report came from a study of the ichthyofauna of the Laptev sea in the Arctic by Russian scientists. Out of a total of 315 species, certain ones were typical of Atlantic fishes, while others were Pacific forms with definite evidence of interbreeding.

One of the two gobioid fishes new to science collected on the presidential cruise into the Caribbean sea in 1938 was given the name of *Pycnomma roosevelti* in President Roosevelt's honour. One of the most interesting chapters written by nature was translated from the study of the life history of the young sailfish (*Istiophorus grey*).³² While in outward appearance the young sailfish somewhat resembled the adult, its structural anatomy gave no hint of the radical changes that were ontogenetically to come. There was no suggestion of the disappearance of the primitive scales and their replacement by bony scutes, nor the shift from a prehensile snout to a stiffened recoil-guarded appendage resembling a great sword, nor the extensive ossification of the joints so as to form a taut, stiffened body so characteristic of the adult. In the mobile body of the young fish, all these trends in reorganization were held in abeyance.

As a side light on sea warfare,³³ a distressing picture was drawn of the fatal suffering of untold numbers of sea birds that mistook "oil slicks" for quiet sea areas. Since mineral oils break the natural protective film of bird feathers it was stated that oil slicks were responsible for an appalling fatality of ducks, gulls and all other birds which rest upon the sea.

The demand for sea foods of all kinds, especially fish, in maritime countries resulted in notes of alarm on overfishing, and suggested ways and means to correct the practice. In England, a lengthy paper was presented before the Royal society³⁴ concerning the situation in waters of the British Isles and North sea. In Canada³⁵ a similar series of problems confronted the government. In Australia, the Council on Industrial Research³⁶ issued a bulletin which dealt with overfishing of the sea mullet, which also contained suggested remedies. In the Mediterranean,³⁷ however, the problem was how best to meet the demands of the undernourished and starving peoples of southern Europe. The answer was found to some extent in reopening Sardinia's sardine and Sicily's tuna canneries. The age-old problems of the biological fouling of ships' bottoms was attacked from several angles. In a lengthy report³⁸ issued jointly by the Iron and Steel institute and the British Iron and Steel federation, it was concluded that any treatment which hindered the deposition of brine salts by living organisms would counteract fouling. It was said that zeolite or sodium permutit admixed with the anticorrosive paint inhibited the formation of gelatinous calcium carbonate, a medium on which fouling organisms subsisted. While still debatable as to its efficiency for all fouling organisms, the new insecticide DDT (dichlorodiphenyl-trichloroethane), when admixed with anticorrosive paints, was used effectively against barnacles.³⁹ It was said by some⁴⁰ to be inadequate against annelids, bryozoan algae or tunicates.

It was concluded that certain island birds of the Pacific⁴¹ had become extinct since a careful survey of Midway and certain other islands failed to discover either the Laysan rail or the Laysan finch. It was thought also that many other birds were in imminent danger of extinction because of the severe war operations among those islands.

Biological Results of the Bikini Bomb.—Official reports on the effects of the underwater atom bomb explosion at Bikini on marine life were unavailable at the end of 1946, but some interesting facts were released which indicated the direction of the effects, if not the extent, such a bomb has upon aquatic forms. The most serious effect was upon the fishes of the atoll waters, there being little evidence of other biological changes in the lagoon. Some fishes were killed by the explosion and others were killed by radioactivity, but the relative numbers involved in the one or the other of these causes were not yet determined. Specimens of bottom-feeding fishes which were caught after the explosion off Bikini, especially some of the reef fishes, were so radioactive that when they were placed upon photographic plates they took their own pictures. Thus it was postulated that the atom bomb could exert a serious effect on the commercial fisheries of the world—actually as well as genetically—and indirectly have widespread repercussions upon the health and well-being of humans as well as

other organisms using them in their dietary.

Marine Botany.—Ever looking to new sources and substances to enrich the sustenance of man, it was not surprising that certain sea plants were made to yield many useful products such as food, fabrics for clothing, fertilizers and drugs.

Taking advantage of advanced biochemical reactions and processes, much research was brought to bear upon the more abundant seaweeds of the shores of continents and many islands. The relative nutritive value of kelp and Irish moss⁴² was ascertained when fed in the dietary of rats. Diets containing approximately 10% kelp increased rate of growth by 20%. Irish moss fed under similar conditions was slightly less effective. It was found that human dietaries benefited similarly when these algae were included.

In a more extensive study⁴³ the nutritive value of the seaweed *Laminaria flexicaulis* was evaluated when used in the dietary of domestic livestock (cattle, sheep, pigs and poultry). This seaweed gathered off the coast of Brittany showed, after being processed into meal, a nutritive assay of three pounds of seaweed meal to four of oatmeal. Similar assays were recognized and put into practice in the U.S. One of the abundant Pacific seaweeds, the giant kelp *Macrocystis pyrifera*, was processed in great volume for feeding purposes. It was discovered by Swedish scientists⁴⁴ that the survival of certain fish larvae during the critical weeks of their existence in the Baltic sea depended upon the quality of the phytoplankton in reference to vitamin D content of the latter. From another seashore plant known as the "devils shoestring," there was extracted an insect-killing drug known as "rotenone." This was a valuable discovery since the chief source of supply had previously been the Netherlands East Indies.⁴⁵

Many of the common seaweeds were demonstrated capa-

ble of forming many by-products, some of which were of commercial use.⁴⁶ From the potash and mineral extractions was derived a third shiny substance called "Algin." Treated with certain reagents, that substance was transformed into "hard rubber"; treated somewhat differently, a film similar to cellophane was formed. It was also spun into thread and was reduced to a white powder which constituted a very satisfactory base for cosmetics, transparencies, plastics, auto polishing powder and creaming agents; it also served as a suspension medium for powdered milk and cocoa. It was reported an excellent sources of glue, gels and mucilage. These commercial applications prompted extensive harvesting and processing organizations.

On the taxonomic side, two epoch-making volumes on the algae were published for the systematist. One dealt with seaweeds of the coast of California.⁴⁷ There were listed in this volume 385 species of marine algae and contained 80% of all known species found along the northern Pacific coast. The other volume was a monumental work from the University Press of Cambridge.⁴⁸ While the title suggests the book deals with the structure and reproduction mainly, it also includes taxonomy, oecology and physiology of these seaweeds. It was reported from the University of Leeds, Scotland,⁴⁹ that a high quality rayon was produced from certain seaweeds (kelp).

The rayon was produced by treating dried seaweed, which contained approximately 40% alginic acid, with an alkali (Na_2CO_3). This treatment formed an alginate rayon of excellent quality and appearance suited to a wide range of dye-fast colours by basic dyes and yarns which were non-inflammable.

It was concluded by scientists at the Marine Biological laboratory of Plymouth, England,⁵⁰ that the autotrophic flagellates and peridinians together constituted the larger proportion of the oceanic phytoplankton; the former form outnumbered the latter by a small margin. (See also BOTANY; EXPLORATION, POLAR; FISHERIES; GEOLOGY; ZOOLOGY.)

Marine Corps, U.S.

When the undeclared Sino-Japanese War mounted to full fury during the summer of 1937, the 4th marine regiment was stationed at Shanghai and a guard of 500 marines was maintained at the U.S. embassy in Peiping. Landing forces, including marine detachments from vessels of the Asiatic fleet, reinforced the 4th regiment in Sept. 1937, and two companies were rushed from Cavite, P.I., naval base. By the middle of the month the forces at Shanghai had been formed into the 2nd brigade, with a strength of 2,536 men for the defense of the neutrality of the International Settlement. In Feb. 1938, fighting moved west of Shanghai and the brigade was withdrawn to San Diego, leaving the 4th regiment to garrison Shanghai. The regiment was finally moved to the Philippines in Nov. 1941.

Under an act of congress of 1919 the strength of the marine corps had been set at 1,093 officers and 27,400 enlisted men. This strength had never been actually reached, and in 1933 the corps had been reduced in enlisted personnel to slightly more than 15,000 by an economy act. In spite of the shortage of personnel, great progress had been made in the study of amphibious warfare.

This study, which began after World War I, had resulted in the establishment of the fleet marine force in 1933. Manoeuvres were held each year thereafter with the fleet, and the body of amphibious tactics evolved in these manoeuvres was standardized in 1938. This doctrine, with minor changes, was used throughout World War II by army, navy and marine forces and was adopted by all the major amphibious forces of the world.

Recommendations and experiments in the manoeuvres in the Caribbean and in the Pacific led to the development of the amphibious tractor and the landing craft which were major weapons in World War II.

Marine aviation units were also assigned to the fleet marine force for the purpose of providing close air support from carriers and land bases, a practice which became standard during the amphibious operations of World War II.

As the United States began to build up its defenses in anticipation of war, the strength of the marine corps was slowly increased to 29,612 in 1940. Continued increases brought total strength to 66,041 on Dec. 7, 1941. In the meantime, a marine brigade of 4,095 men had been sent in July 1941 to Iceland, where elements remained until the end of 1942 in defense of that base. Stations from the Philippines to the leased bases in the Atlantic also had increased marine garrisons during 1941, and two divisions were formed. Elements of the 2nd division moved to the Samoan Islands in Jan. 1942, to protect that vital base.

With U.S. entry into the war, the marines first went into action at Wake and Bataan. A small garrison of 378 marines on Wake Island (*q.v.*) withstood heavy Japanese

U.S. marines, newly landed at Okinawa, closing in on Japanese snipers hidden in a burial vault near the town of Sobe. The town was taken within an hour of the first landings on April 1, 1945

attacks for two weeks in Dec. 1941 before they were finally forced to surrender after inflicting heavy damage.

The 4th regiment, withdrawn from Shanghai, participated in the defense of Bataan and Corregidor (*q.v.*) and a marine detachment on Midway (*q.v.*) successfully withstood repeated Japanese aerial assaults. Small detachments at Guam and Peiping were captured.

In Aug. 1942, the 1st marine division, reinforced, struck the first land offensive blow of the war, seizing Tulagi, Florida, Gavutu and Tanambogo islands and establishing a beachhead on Guadalcanal, in the British Solomon Islands (*q.v.*). The 19,119 officers and men of the division, semi-isolated by furious naval battles, seized and defended Henderson field on Guadalcanal against Japanese forces which were gradually reinforced to an estimated strength of 50,000. When the marines were relieved by army troops in Dec. 1942, they had control of a beachhead 10 mi. long and 5 mi. deep and had killed 26,000 Japanese troops while losing 1,121 killed and 2,672 wounded.

During 1943 units of the 1st marine amphibious corps joined with army forces in consolidating the central Solomons, making landings on New Georgia, Rendova and Arundel islands. In November the 3rd marine division seized a beachhead on Bougainville, completing the circle of Allied bases in the Solomons, while the 2nd marine division, as part of the 5th amphibious corps, opened the drive across the central Pacific by seizing Tarawa atoll. The marines stormed heavily fortified Betio Island and destroyed its 4,000 defenders at a cost of 985 killed and 2,167 wounded in a bitter four-day assault. (See GILBERT ISLANDS.)

In Dec. 1943, the 1st marine division began the seizure of Cape Gloucester, sealing off the western end of New Britain, largest island of the Bismarck archipelago.

During Feb. 1944, marines joined in the attack on the Japanese-mandated Marshall Islands (*q.v.*). The 4th division seized Roi and Namur islands, as well as 55 smaller islands. In the second phase, the 22nd regiment, assisted by an army unit, captured Eniwetok atoll with its fleet anchorage. Marine corps casualties for the Marshalls campaign were 430 killed and 1,363 wounded, while the Japanese suffered 6,639 casualties.

Emirau Island in the St. Matthias group was seized in

March without a fight and in June the 5th amphibious corps began the bloody assault on the vital Marianas Islands (*q.v.*). Supported by the greatest fleet concentration ever used up to that time, the 2nd and 4th marine divisions landed and overwhelmed the fanatical Japanese defense of Saipan in three weeks of extremely severe fighting. They were aided by the 27th army division. In July the 3rd marine division, the 1st provisional marine brigade and the 77th army division recaptured Guam (*q.v.*) while the 2nd and 4th marine divisions reduced Tinian in eight days after achieving tactical surprise by landing over narrow beaches considered by the Japanese as impracticable for a main attack.

A total of 20,183 casualties were suffered by marines in the Marianas fighting, while 53,569 were inflicted on the Japanese by combined forces.

In Sept. 1944 the 1st marine division destroyed 12,000 fanatical defenders on Peleliu in the Palau Islands in a grueling one-month battle which cost 6,298 marine casualties.

The Japanese defended their islands during 1945 with increased fanaticism and tenacity. The 5th amphibious corps, composed of the 3rd, 4th and 5th marine divisions, engaged in 26 days of the most violent battle to reduce the heavily fortified volcanic island of Iwo Jima (*q.v.*) in the Bonin group. Smashing through a network of underground fortifications, the marines counted 21,000 of the estimated 23,000 defense troops as dead, with others buried in their defenses. The marine forces sustained 21,406 total casualties, which included more than 5,528 dead.

In April 1945 the 3rd amphibious corps landed on Okinawa (*q.v.*) in the Ryukyus, forming with the 24th army corps the 10th army. The landing was unopposed, and the 1st and 6th marine divisions fanned rapidly northward from the initial beachhead, securing the north 30 miles of the island by cleaning out Motobu peninsula in three weeks against moderate resistance.

The 24th army corps, meanwhile, had found the Japanese entrenched in the powerful Shuri line, one of the strongest defensive positions encountered in the Pacific. In May the marine divisions were committed against this line. The 6th division broke through the western anchor at the capital city of Naha, crossing the Asato river and beating back furious counterattacks.

The 1st division pierced to Shuri castle, the heart of the defensive system, by a surprise infantry assault through heavy mud which prevented the use of armour or vehicles. The island was secured in June, after 83 days of battle which cost the Japanese 111,351 casualties. U.S. forces suffered 11,879 killed or missing and 46,319 wounded. Marine casualties were 3,145 killed and 14,527 wounded.

The marine corps had reached a maximum strength of 485,934 during World War II and suffered 84,812 battle casualties, including 19,549 killed.

A total of 596,182 men and women served in the marine corps during the period of hostilities. Of these, the majority totalling 396,767, formed the fleet marine force. At its greatest strength the F.M.F. was composed of two amphibious corps, the 3rd and 5th, with six divisions and five air wings which were assigned to a corps as needed for a specific operation. Special troops, such as reconnaissance elements and defense battalions, were also included.

A total of 22,466 marines, enough to comprise a reinforced division, were stationed aboard the capital ships of the fleet and participated in every major naval action. Detachments of marines from battleships participated in limited land actions in connection with the landings in

North Africa, Italy, Normandy and southern France.

A total of 528,496 marines served overseas during the war, including approximately 98% of all officers and 89% of all enlisted personnel. In addition to the fleet marine force and ships' detachments, marines served outside the U.S. continental limits as garrison forces and guard detachments for naval establishments.

Aviation personnel serving outside the continental limits totalled 93,796. Besides providing close support for ground forces of the fleet marine force, marine aviators were assigned the mission of neutralizing certain Japanese bases, notably Rabaul and the by-passed atolls of the eastern Marshall Islands.

Aviation and artillery units supported army troops during the reconquest of the Philippine Islands. Adoption of suicide tactics by Japanese pilots in attacking the U.S. fleet necessitated the replacement of dive bombers by fighter aircraft aboard the carriers. Marine fighter squadrons were installed on eight carriers during 1945 and participated in strikes against the Japanese homeland as well as the defense of the fleet. In 1946 marine squadrons were retained aboard six carriers.

The strategic use of the fleet marine force in combatant action throughout World War II demonstrated for the first time since the Allied fiasco at Gallipoli in 1915 that an amphibious landing could be made in the face of modern defenses. The unchallenged surge of the Japanese amphibious forces toward Australia was halted in the Solomons by the employment of land, sea and air arms in the closest co-ordination. Without the previous training and established doctrine derived from the manoeuvres of the fleet marine force with the fleet before the war, the Allies could not have undertaken to stop the Japanese offensive at that time.

Close support by aviation units was provided throughout the consolidation of the Solomons, and the neutralization by air of the northernmost Japanese bases there precluded the need for further landings.

In the drive across the central Pacific the mission of the fleet marine force was to seize the advance bases needed by the fleet in what was essentially a naval war.

The advance into the Marianas brought an anticipated violent reaction from the Japanese in view of the fact that their home islands were brought within range of both ships and planes. Increasing success by the B-29 long-range bombers based in the Marianas was hampered by the lack of fighter escort and Japanese interference from bases in the Bonins. Consequently, the 5th corps of the fleet marine force was assigned the mission of reducing the formidable bastion at Iwo Jima by amphibious assault. The successful landing was made possible only by overwhelming naval and air superiority provided by the fleet. The seizure of Iwo Jima provided an advance base in this case for planes.

The fleet marine force then helped to complete the purely naval advance which reached its high point at Okinawa. The seizure of Okinawa with its many potential airfields placed all of Japan within range of medium bombers, protecting fleet operations in Japanese home waters. The seizure of Okinawa also provided the staging area and the final springboard for the assault on Japan which was planned for the end of 1945.

Following the Japanese surrender, two marine regiments, one formed from marine detachments of the 3rd fleet, took part in the initial occupation of Honshu. The 5th amphibious corps, composed of the 2nd and 5th ma-

Palm fronds covering the simple graves of U.S. marines killed in action during the first attack on Guadalcanal in Aug. 1942

rine divisions, then landed on Kyushu and in Yamaguchi prefecture of Honshu as occupation troops. In Dec. 1945, the 5th division and corps were deactivated, and the 2nd division returned to the United States in Aug. 1946.

The 3rd amphibious corps, composed of the 1st and 6th marine divisions, was landed in North China to enforce the surrender of Japanese elements there late in Sept. 1945. Threats of civil war between the Chinese nationalist government and communist forces led to the retention of the 1st marine division, reinforced, with garrisons in Hopei and Shantung provinces to protect vital mines, railways and ports supplying the cities of North China.

By the end of 1946 the marine corps was reduced to the peacetime strength authorized by congress that year of 100,000 enlisted men, 7,000 officers and 1,200 warrant officers. An enlarged reserve was also authorized.

General A. A. Vandegrift was commandant of the marine corps in 1946, being stationed at administrative headquarters at the navy department in Washington, D.C. He succeeded Lieut. Gen. Thomas Holcomb in Jan. 1944.

The marine corps was organized with shore establishments and units of the fleet marine force on each coast, ready for action with the Atlantic or Pacific fleet. The most important posts and stations were: Camp Joseph H. Pendleton, at Oceanside, Calif.; El Toro and Miramar air stations, in California; Camp Lejeune, N.C.; Marine Barracks, Quantico, Va.; and Marine Air Station, Cherry Point, N.C. All except Quantico were constructed in the period 1941-45.

Basic training for marine recruits during World War II centred at Parris Island, S.C., and the Marine Corps Base at San Diego, Calif., and plans were made to continue their operation. Military schools and research were carried on at Quantico. (A. A. V.)

Women's Reserve.—The marine corps women's reserve was the last of the women's military services of the United States to be organized; but the prestige of the corps and the fact that it was willing to call its women reservists "marines," instead of giving them a nickname, resulted in its speedily attracting a fine type of young woman.

On Feb. 13, 1943, General Thomas Holcomb—then commandant of the marine corps—announced that 18,000 enlisted women and 1,000 officers were needed for the women's reserve. This quota was reached in June 1944, less than 16 months after the first announcement had been made, and thereafter only sufficient recruiting was done to supply replacements for normal attrition.

Recruits came from all parts of the country; but the greatest number came from the northeastern, north central and Pacific coast states. The eligible ages for enlisted women were 20 to 36 years inclusive; but the average age proved to be 23½ years.

Only two years of high school were required for enlisted women, but all except 13% had more than this education; 65% had completed high school and 22% had had some college work. It is also interesting to note that 88% of recruits had army general classification test scores between 89 and 129; 6% had lower scores than 89 and were almost equally balanced by 6% who had test scores between 130 and 151. This high level of intelligence and education undoubtedly had much to do with the fine standard of efficiency and behaviour later attained by members of the marine corps women's reserve.

Through the co-operation of the U.S. navy and Capt. Mildred H. McAfee, director of the WAVES, the first enlisted women marines and the first officer candidates received their basic training in navy schools. But in July 1943, as soon as enough women officers and enlisted women had been trained to provide a skeleton staff for its own schools, the basic training for all members of the marine corps women's reserve was moved to Camp Lejeune, N.C. This was a permanent marine corps camp for men and afforded very good accommodations and training opportunities. Recruit depot and officer training school continued to operate there until the end of the war; and women reservists also attended with the men such advanced schools as quartermaster, motor transport, cooks and bakers and paymaster. Other women reservists—particularly aviation personnel—took advanced training in navy schools, both clerical and mechanical.

Special efforts were made through interviews and aptitude tests to fit the women to the jobs. About 65% of the women had held clerical jobs in civilian life, and a similar percentage held such jobs in the marine corps, though the individuals were not necessarily the same. For instance, at headquarters, marine corps, where a great deal of clerical work was required, 87% of the enlisted personnel were women reservists. Those not engaged in clerical work filled a wide variety of jobs, a considerable number of them being of a mechanical nature.

Eighteen months from the time the first announcement of a women's reserve was made, its members constituted from one-half to two-thirds of the permanent personnel, at marine camps along the Atlantic and Pacific coasts. They helped in the training, processing and supply of the combat units which passed through them; and also in the maintenance and operation of the camp services. They also did all the work required to make their own units self-supporting. In Aug. 1945, there were 28 units, composed of 579 officers and 14,252 enlisted women serving under women commanding officers in the United States. There were also 17 smaller units, consisting of 102 officers and 1,876 enlisted women, and a few others were on scat-

tered, specialist duties, such as recruiting.

On Sept. 27, 1944, congress amended the Naval Reserve act to permit women to serve on duty in the Territory of Hawaii upon their prior request. The first volunteers arrived in Honolulu on Jan. 28, 1945; and by August of that year there were 34 officers and 580 enlisted women in the women's reserve battalion at Pearl Harbor, and 21 officers and 366 enlisted women in the women's reserve squadron at the marine corps air station at Ewa.

The surrender of Japan on Aug. 14, 1945, came exactly two and a half years after the formation of the marine corps women's reserve. It found that organization at a total strength of 831 officers and 17,714 enlisted women.

It then became important to demobilize this group as fairly and steadily as possible, without interfering with the orderly demobilization of men who had seen combat. Women reservists were discharged on the basis of credits, which in most cases were based on length of service only. After V-E day, special concessions were made to wives of men discharged from military service; and after Sept. 1, 1945, such women were automatically discharged upon their own request, as were also any women more than 35 years of age. As the system of credits worked out, it appeared that the great majority of women served approximately two years in the marine corps women's reserve.

On Dec. 7, 1945, Col. Ruth Cheney Streeter, the first director, resigned her commission and was succeeded by Col. Katherine A. Towle. The difficult and delicate task of orderly demobilization was carried out under her supervision. She also developed plans for organizing and training a postwar women's reserve. Since all women reservists except a few who had volunteered to remain on duty at headquarters, marine corps, were scheduled for discharge before Sept. 1, 1946, Col. Towle in turn submitted her resignation as director.

Postwar plans did not call for retaining any substantial number of women reservists on full-time duty; but Gen. A. A. Vandegrift, commandant of the marine corps, stated that the corps would like to train a part-time women's reserve of 500 officers and 4,500 enlisted women, which would be capable of rapid expansion in case of need. On Sept. 5, 1946, Major Julia E. Hamblet was appointed director, to develop such an organization. (R. C. Sr.)

Marriage and Divorce

U.S. family life during the decade 1937-46 revealed the consequences of an unprecedented period of storm and stress. As various studies of the family had demonstrated, the domestic institution was already encountering rough passage as it attempted to adjust to the social changes of the 20th century and the shift from the traditions of a rural economy to a dominant urban modern culture. Then, before reaching any measure of security, it had to meet the new impact of two catastrophes—the depression beginning in 1929 and World War II.

One expression of the inward instability of the family

was the increasing divorce rate. As had been expected, the war accelerated this trend. First of all, it reversed the influence of the depression, which had delayed and discouraged marriage. A considerable part of the increase in marriages during the war years came from reckless and even insincere mating. It was apparent to students of the family that, as was true after World War I, a great many of these war marriages would end in divorce. This occurred everywhere in the world where there had been social disturbance because of World War II and legal opportunity to obtain release from domestic dissatisfaction. This stimulus to divorce in turn became a social influence affecting some husbands and wives who in a more stable period would solve their domestic difficulties and achieve an enduring marriage.

The draft act became a major influence. Although it delayed some marriages it hastened more and led some to become parents who had either postponed the coming of children or had planned to have none at all. As soon as preparation for national defense became an avowed governmental policy the effect of war industry upon marriage was apparent. Multitudes of men and women moved from the country, village and small city to the great industrial centres, attracted by the opportunities offered by the production of war materials. Marriages increased in 30 of the largest cities possessing about 1/4 of the nation's population. The increase was especially great where shipbuilding, naval and aviation industries flourished. During the first 11 months of 1941 marriages gained 8.8% over the previous year for the same period.

The migration to industrial centres affected family life in many ways. Most obvious was the great overcrowding. Housing facilities were far behind the needs. Slum conditions were re-created in some localities. Everywhere living conditions were abnormal. In many homes there were sudden changes in the standard of living not always leading to a rational household program. Frequently both the father and the mother went outside the home to work, and in spite of public effort to take care of this problem a portion of these families were undermined and their children neglected. Abnormally high war wages raised the income of many families; increased taxation and higher prices lowered that of others.

When the United States actively entered World War II these disturbances increased and new ones were added. As a multitude of men and some women went into the armed forces, many homes were temporarily broken. There were more hasty and thoughtless marriages. Young men were moved from accustomed social surroundings and thrown without needed preparation into alien countries with the consequence that, upon their return to the United States, some could not, or could not easily, adjust to their former family life. Once casualties began to occur, homes were permanently broken; in many such families husband and wife had lived together only a few weeks or months. Children appeared in homes where there were no fathers. There was a decided shift in the sex ratio of the country, especially where war industries concentrated, removing from many women opportunity for normal courtship and adding strength to the already existing trend toward greater sex freedom and promiscuity.

The most significant and alarming expression of this greater sex freedom appeared in the startling increase of delinquency, especially among teen-age girls (see CRIME). This indication of social disorganization among young girlhood was in its size, a new national experience. World

War I had upset the U.S. moral code less and had chiefly affected the older adolescents. The longer World War II continued the more apparent it became that no portion of the population was being more disturbed than the teen-age group. This problem of delinquency persisted in the postwar era. The testimony of social workers as to the magnitude of teen-age delinquency, at least in part a consequence of the war, was brought out in John Edgar Hoover's annual statements of arrests. During the first six months of 1943 as compared with a similar period in the previous year the increase in the delinquency of girls under 21 years of age was 64.7%. More impressive was the fact that there were more arrests during this six months period than for the entire 1941 calendar year. For offenses against common decency the number of girls under 21 years of age arrested during the first half of 1943 increased 89.5%. Reports of delinquency as a result of maladjustment among youth, especially girls, came from every section of the nation, especially from cities and communities near war camps. One of the most startling evidences was the increase in cases of syphilis among boys and girls between 15 and 20 years of age. The New York health department reported that primary and secondary syphilis increased 37% during 1942 as compared with the period from 1939-41.

The trend in arrests was a significant portrayal of the delinquency situation but not the only evidence. Cases of young girls taking part in holdups and even murder gave spectacular emphasis to the profound social disorganization experienced by youth as a result of the war conditions, principally the lack of family discipline. The situation in 1945 revealed that peace had not ended the abnormal situation. In that year, 30.1% of the rapes were committed by persons under 21, as were 33.5% of the larcenies, 35.2% of the robberies, 49.8% of the burglaries, 61.1% of the car thefts.

* * *

THE SHORTAGE of labour in war industries created a demand for youthful workers. During 1943 and 1944, 27 states modified child labour laws, though the majority of these changes were only for the duration of World War II. In addition there were 15 administrative rulings which made it easier for minors to be employed. In some homes trouble came because these youths who ordinarily would have been at school were working and earning more than the father. Thus they were naturally unwilling in many instances to accept the discipline which under normal conditions would have been taken as a matter of course.

Not only did World War II rearrange the accustomed patterns of courtship; it also frequently prevented the normal building of a home. After marriage the bride had to live either with her own parents or with her husband's while he was stationed at a distance. This arrangement, always hazardous, was especially so during the stress of war. It took considerable time for letters to go back and forth; any friction that developed between the young wife and her parents or in-laws, if expressed in correspondence with the husband, easily led to a feeling of frustration that became a wedge between husband and wife. Such friction was the greater because often the two young people had been together too short a time to develop the sense of union which they so greatly needed for a struggle with circumstances not to their liking.

The experiences of war also brought about personality changes which in some instances destroyed the harmony of

husband and wife relations. These changes took many forms with consequences affecting marriage. Some husbands returned physically mutilated; some suffered from mental shock even to the point of developing mental disease; others were too thoughtful, too mature and too serious to fall back into ways once accepted and still preferred by the wife. Some husbands became enamoured of other women, too often themselves married, and insisted upon a divorce. Some returned to find that their wives had been promiscuous or had fallen in love with some other man. Other husbands experienced suspicion or jealousy for which there was no basis but which nevertheless destroyed marriage harmony. Even the unwillingness of some women to return to housekeeping after having enjoyed a different kind of occupation during the wartime became a motive for divorce.

Of all the peacetime problems which struck against the marriage happiness of veterans, none proved so great as the lack of housing. Thousands of men who dreamed of their return to a normal home life found that this was denied them merely because they could not find suitable quarters. Population displacement, the lack of new construction because industry had concentrated on munitions and other matériel of war and the increased population all worked together to bring about a situation which not only led to bitterness and disillusionment but often removed privacy and made living uncomfortable—both serious handicaps to a normal marriage.

Distribution of Families by Marital Status of Family Head, United States, 1940

Marital Status of Family Head	Percent Distribution					
	Of All Families	Of Broken Families				
	Total	Male Head	Female Head	Total	Male Head	Female Head
All families	100.0	84.7	15.3			
Natural families (husband and wife present) . . .	75.8	75.8	—			
Family head single	6.4	3.8	2.6			
Broken families	17.8	5.1	12.7	100.0	28.9	71.1
Widowed	12.7	3.3	9.4	71.1	18.7	52.4
Divorced	1.6	.5	1.1	9.3	3.1	6.2
Separated	3.5	1.3	2.2	19.6	7.1	12.5

A study by the American Institute of Family Relations of divorces in Los Angeles county showed a higher proportion of marriages which lasted not more than a year and of childless marriages than ever before. From the 1945 docket of the Los Angeles county superior court, 547 cases were studied. The marriages of these couples had a mean duration of 6.1 years as compared with a similar sample taken from the same court in 1933, when the average duration was 9.27 years. Of the divorces for 1945 23% came from marriages that had lasted a year or less; 67% had lasted less than 4 years, contrasted with 45% in 1933. Of the 1945 group 58% were childless as 45% had been in the earlier period. This trend discovered in Los Angeles was probably representative of a significant tendency in the United States not to struggle long against marital unhappiness.

Although not entirely a product of war marriages, the trend had been accelerated by marriages based on short acquaintance or on hasty decision.

It would be a distortion of the facts to credit World War II only with liabilities for marriage and family life even though this was its greater contribution. War conditions augmented and accelerated some movements which tended to strengthen and improve family life. A summary of significant changes in domestic relations brought this fact out. Some changes had to do with the functioning of the family and some with its composition. One important indication of progress affecting the former resulted

from the appropriation of \$1,500,000 in connection with the Social Security act which was passed in 1935. This sum provided for grants-in-aid to help states develop their child welfare services. At that time, although every state had laws for the care and protection of children, only 26 had welfare departments with responsibility for conducting or synthesizing the child welfare services on a state-wide basis. In 1946 every state and the three territories of Alaska, Hawaii and Puerto Rico recognized by law their responsibility for maintaining and directing services for the welfare and protection of children. The federal appropriation became a stimulus for increasing and expanding work under the auspices of the state and local community. In every state new services were inaugurated, and those already in operation were improved. Professional standards were raised. In 1945 17 of the states made provision for the employment of psychiatrists or psychologists as technical consultants. New laws were passed or old ones improved in order to safeguard child welfare. When World War II came it proved fortunate that this nation-wide effort to safeguard child life was well established and able to provide new facilities during the emergency and to resist the pressure to lower restrictions on child labour without regard to future consequences on marriage and family life.

A great number of mothers with small children entered industry, thereby creating a very great need for the expansion of nursery service. Various programs were carried through, each adapted to the local situation and recognizing differences in the demands made by older and younger children. The community programs for taking care of these children were made as economical as was consistent with good standards of service. Needs of the national war effort and those of individual families and children were recognized; neither was unduly compromised for the advantage of the other. Changing conditions in the communities and in families also had to be provided for, since a static program would have proved unsatisfactory. A counselling service became a necessity. Otherwise the mothers not only found difficulty in meeting their domestic problems but grew restless and discontented in their work. Although day-care nurseries and other centres for the care and supervision of children of employed mothers did not entirely remove the risks these children faced in the war

emergency, they greatly lessened the problems that concerned the future welfare of family life.

Women volunteers were trained for the work and reinforced the inadequate staff of social workers and child specialists.

* * *

ONE OF the most successful of the various activities carried on in association with the social security program had to do with problems of maternal health. One aspect was the protection of the woman in industry who became pregnant. The following principles were observed: opportunity was provided for adequate prenatal care, provision was made for the woman's having sufficient time off before delivery to prepare her for the experience and to prevent strain during the latter part of her pregnancy. It seemed wise also for the women to avoid the night shift, including the hours from 12 midnight to 6:30 A.M. They also were not allowed to work more than 8 hours a day or more than 48 hours a week. The women were prohibited from entering occupations involving heavy lifting, continuous standing on their feet, or any kind of work that exposed them to special risk of accident or to toxic substances. The women already in such occupations were placed in other work. It was also recognized that it was desirable for the woman to be free to leave at any time during her pregnancy if her physician decided that this was desirable.

The enactment of federal provision providing prenatal care for the wives of men in the armed services contributed greatly to the encouraging decrease in maternal deaths. This progress, relatively slight up to 1936, increased rapidly after that time. The period of greatest reduction was during the time of greater state and local activity in maternal and child health work as a result of federal and state co-operation under the Social Security act. The decrease for white women was 48% from 1930 to 1940; for Negro women 34%.

During the same period there was also a decrease of 28% in infant mortality. In the five-year period 1936-40, as compared with 1931-35, there was a reduction of 27% in the maternal death rate. This was the result of better medical care and supervision, since the reduction was largest for deaths from infection, 31%, deaths from tox-

Men and women at the Marriage and Family council, Chapel Hill, North Carolina, in 1941, attending an instruction class in courtship and preparation for marriage

aemias, 24%, from haemorrhages, trauma or shock, 16%. The decrease in infant mortality rate for the five-year period compared with the earlier five years was 12%. These decreases in mortality rates were equivalent to the saving of the lives of 18,550 mothers and 80,901 infants. Progress was also explained in part by the fact that in 1935, 37% of live births occurred in hospitals, but in 1940 it had risen to 56%. The proportion of births with no medical attendance decreased from 12% in 1935 to 9% in 1940.

There could hardly be any contribution to the function of family life more valuable to society and the individual home than this lifting of the standards of maternal care and the lessening of the infant death rate. There was considerable variation between the states. The south had the highest maternal mortality rate; it was more than two and a half times as high for Negro women as white. Nevertheless, the death rate was lowered for both groups, and the higher standard of medical care represented an advance that was not confined to its immediate objective, pregnancy and childbirth.

Another factor in the function of the family was the decrease in the age of mothers. In 1920, 8.6% of the total births were to mothers under 20 years of age. In 1935 it was 11% and the same again in 1940. Women 20-24 years of age represented 28.1% of the total in 1920 and 31.3% in 1940. The years of World War II increased the birth rate among young mothers. This trend contributed somewhat to the lowering of the death rate, since medical records showed that the most healthful age for child-bearing is the decade from 20-29.

Since the birth rate had increased 30% in the United States between 1933 and 1943, it might be assumed that the American family was growing larger. The fact was, however, that this increase came almost entirely from the rise in the marriage rate and the greater number of one and two child families of young married couples. During the depression there was a falling off of marriages leading to a deficit of nearly 800,000. This trend was reversed between 1933 and 1941. In 1942 the marriage rate reached an all-time high; this was followed the next year by the largest number of babies born in U.S. history, more than 3,000,000. A larger number of medium-sized families rather than a relatively small number of large families was to be preferred, since it distributed the values of parenthood to a larger number of persons and provided more favourable economic and social conditions for the average child.

Analysis of the 1940 census data confirmed the conclusions of previous sample studies, that the birth rate was lower among those with the advantages of higher education. Native white women aged 15-49 who had 4 years or more of college education gave birth to slightly less than $1\frac{1}{4}$ children per woman and thus failed to replace the population by 45%. Native white women in the same age group who were graduates of high school gave birth to $1\frac{3}{4}$ children per woman. Their failure to replace was 21%. Native white women in that age group who had completed only 1-4 years of grade school had a record of $4\frac{1}{8}$ children and had over-replaced by 95%. The record for women aged 30-34 years who had not completed their families in 1940 and who had children ranging from 5-20 years of age revealed a still greater difference. Those who had 4 or more years of college had only .7 of one child per woman; graduates of high school had 1.2 while those with only 1-4 years of grade school had more than 3 children per woman. The birth rate of those who had not gone beyond

6th grade in the age group 20-29 was 6 times as high as that of women who had completed 4 years or more of college.

Analysis of the birth rate on an economic basis disclosed that, in the middle class, those homes with a monthly rental ranging from \$30 to \$49 lost most ground in the birth rate. Women aged 45-49 years whose homes ranged from \$5 to \$14 in monthly rental value had had twice as many children per woman as women in the same group whose homes ranged from \$40 to \$100. The rate of those in the middle group with a rental value of \$50 to \$99 was $1\frac{3}{4}$ children. The highest rate of increase was found among those whose homes ranged in value from less than \$5 to \$14 monthly rental. Their record was 4.2 children per woman; while the other 2 classes under-replaced the population, they over-replaced it by 76%. This trend toward the relative lessening of the middle class, which had always acted as a cushion between the other two and had thereby contributed to the stabilizing of society, continued throughout the decade 1937-46.

* * *

A STRUCTURAL CHANGE favourable to national welfare, on the other hand, was the tendency toward more inter-marriage among national groups. A study of marriages in New York state, exclusive of New York city, permitting comparison between 1928 and 1941 showed that nearly every one of the national groups had been increasingly marrying with other stocks. Couples born in the United States of foreign or mixed parentage were increasingly marrying into families of other national origins than their own. The same trend was observed in the case of foreign-born women. A striking illustration was the increase of women born in England, Scotland or Wales and married in New York. In 1920 63.8% of these women married men born in one of those countries. In 1940 the percentage became 44.4. There was, however, little change in the habit of native Italian women marrying within their own national group.

A significant structural trend in U.S. population was that of an increasing number of aged persons. In 1944 average length of life (life expectation) was $65\frac{1}{8}$ years, almost 16 years greater than at the beginning of the century. For white females it was 68.95; for white males 63.55, a little less than the peak of 1942 as a consequence of the relatively high mortality among men in military service. Although the life expectancy of Negroes was less, their gains since the beginning of the century had been considerably larger, 22 $\frac{3}{4}$ years for males and 24 for females. The proportion of old people was increasing more rapidly in the large U.S. cities than in the country as a whole. Between 1930 and 1940 the number of people aged 65 and over in the United States increased 35%. In cities of 250,000 or more inhabitants, however, the increase was 47%. Cities with low percentages of elderly people were generally in southern states; those with the largest numbers on the Pacific coast. Two cities in New England, Boston and Providence, also showed a high proportion of older people. The fact that elderly persons are more likely to be a burden to a family in urban than in village or rural communities became a distinctive feature of American life, significantly affecting marriage and the home. Many of these aged persons could not be adequately cared for by family members without affecting both marriage and child-bearing. In the middle class especially younger family members, because of their responsibility for elderly parents, postponed or gave up the idea of marrying. There was reason to believe also that for the same reason married couples denied themselves parenthood or postponed or

limited it. Insofar as the aged were supported by public funds, the middle class received relatively less assistance from public funds and was more sensitive to the effect of increased tax burden, its adversity affecting its opportunity or willingness to reproduce. In 1946 the *Journal of Gerontology* began publication, providing a much needed periodical for the scientific discussion of the problems of aging.

During the decade 1937-46 much progress was made in premarital legislation. By 1945 32 states and the territory of Hawaii required premarital examinations and blood tests for syphilis before issuing marriage licences. Thirty five of the same states and the territory of Hawaii also required that the examining physician make a blood test for syphilis in expectant mothers. Although in 1945 there were ten states which had refused to pass laws regarding premarital examination, the tendency suggested that soon this would be a standard requirement throughout the United States. Progress also was made in acquainting those about to marry, especially the college group having had marriage courses, with the advantages of the premarriage medical examination, particularly of women. During the ten-year period there was greater recognition of the need for revising divorce laws pertaining to those suffering from long continued and apparently incurable insanity.

These laws generally required a definite duration of insanity before granting divorce and also satisfactory arrangements for the support of the insane partner during his or her life.

A significant divorce decision of the United States supreme court was that of *Williams v. North Carolina* in 1944, in which North Carolina for a second time appealed divorce decrees granted in Nevada to two of its residents who went there for the six weeks' required residence. The contention of North Carolina that the six weeks' absence from the state did not constitute a genuine residence in Nevada since it was undertaken merely to obtain a divorce with the intention of then returning to North Carolina was upheld. As a consequence, a great many similar migratory divorces had their validity thrown into doubt. In England a decision of equal legal significance was made by the British court of appeals' annulling a 13-year marriage as unconsummated on the ground that the husband insisted on using contraceptives.

Great progress was made during the decade in various movements to conserve marriage and family life. There was a large interest among professional groups, especially sociologists, social workers and physicians in activities designed to strengthen marriage and lessen divorce. On the part of the churches there was a decided lessening of emphasis on repressive measures to meet the divorce evil and more emphasis on educational efforts for the building of wholesome marriage and family life. All three of the major faiths, Catholic, Protestant and Jewish, developed various organizations to encourage education for marriage and counselling of those encountering difficulty in their marriages. Agitation among Protestants continued throughout the period for the liberalizing of church regulations concerning divorced persons. Within the Episcopal Church the group asking for a more liberal attitude gained in strength. Increasing attention was given to the training of candidates for the ministry as marriage counsellors. Among new developments was the recognition of a small group of professional marriage counsellors that they needed a national organization to establish professional ethics and standards of procedure. This led to the establishment of the American Association of Marriage Counselors in 1945.

There was a marked increase in specialized studies concerning marriage and divorce. Slight progress was made during the period in providing instruction in preparation for marriage for high school students. Here, however, greater emphasis was still on family life, with little frank discussion of marriage problems. The conviction was growing among students of the family, nevertheless, and was supported by thoughtful parents that even as far down as the elementary grades an intelligent program for the conservation of marriage should be included in the instruction, adapted to the age level of youth, as preparation for the responsibilities of marriage and parenthood. There was a marked increase in the literature dealing with marriage counselling during the last half of the decade.

Graduate instruction planned to prepare specialists as educators and counsellors in the field of marriage and the family was developed at the University of North Carolina and at Pennsylvania State college. A great many conferences dealing with marriage and family life were held in various parts of the United States. The National Conference for Family Relations grew during the period both in numbers and in influence.

Great Britain.—English and Scottish law recognized before 1937 the validity of polygamous marriages only as far as rights of succession to property and legitimacy were concerned. This recognition was carried further in 1939, when the house of lords recognized a Hindu polygamous marriage in which husband and wife later joined a monogamous sect as sufficiently valid to entitle the son of the union to succeed to a peerage of the United Kingdom; and further still in 1945 when a Hindu's earlier polygamous marriage was held valid and his later English wife obtained a divorce on the grounds of bigamy. In Scotland irregular or "Gretna Green" marriages by declaration before witnesses or on promise were no longer capable of being validly contracted after the coming into force of a 1939 act, the operation of which was due to start in 1940 but was postponed because of World War II.

Marriages under Scottish law were allowed in wartime in England in cases of Scottish persons in the navy, army or air force.

In 1938 important developments of the divorce law took effect. Divorces were not permitted within three years of a marriage except in special cases by leave of the court, and desertion for three years or more, cruelty and incurable insanity for at least five years became grounds on which a marriage might be dissolved at the instance of either husband or wife. A wife could also obtain a divorce on the ground that the husband had since the marriage been convicted of rape, sodomy or bestiality. Additional grounds were also added on which a court might declare a marriage void: these were nonconsummation because of the wilful refusal of either party, insanity or epileptic condition, pregnancy by another man or venereal disease, if any of these states existed at the time of the marriage and was

unknown to the party instituting nullity proceedings. A further alternative was an application for presumption of death and consequent dissolution of marriage. These new grounds greatly increased the number of divorces granted which rose steadily from 5,000 in 1937 to 10,000 in 1943, and more than 20,000 in 1946.

Wartime marriages created a problem as they were often undertaken on the spur of the moment with foreign or dominion troops and later gave rise to difficulties of nationality and domicile as well as matrimonial incompatibility. To meet these, it became law in 1944 that the English court could dissolve such marriages at any time if the wife had been domiciled in England when married and had not gone to the country to which her husband belonged; such divorces could before only have been pronounced in the country of domicile of the husband.

The final development in the extension of the ease with which marriages could be dissolved came in 1945 and 1946, when administrative action by the lord chancellor greatly increased both the number of the tribunals which dealt with divorce (by the temporary addition of special commissioners and county court judges to the divorce judges of the high court) and also the number of Poor Persons Legal Aid units (consisting of one solicitor and a staff of assistants) who prepared cases for persons of inadequate means at the public expense, which grew from 8 to 34. Another rule reduced, from Oct. 5, 1946, the six months' waiting between trial and final decree of divorce to six weeks only. The committee on Procedure in Matrimonial Causes set up by the government under the chairmanship of Justice Alfred Denning made other proposals for cheapening costs and simplifying procedure in divorce which were still under consideration at the end of 1946.

Reforms were also made in the law relating to domestic proceedings arising out of a marriage but not aimed at divorce. In such cases, usually brought to obtain orders for maintenance in the magistrates' courts, the parties had from Oct. 1937 to be heard as far as possible in private, newspaper reports were restricted to a minimum, conciliators were often appointed to bring the parties together again if possible, and the court itself was to consist of not more than three justices, including a man and a woman.

As a result of the wider grounds for divorce, the instability of many wartime marriages, the increase in the speed with which divorces might be obtained and the decrease in the costs of a divorce, a divorce came to be looked on by the end of 1946 much more as a normal incident of life than in 1937.

Europe.—During World War II countries whose governments were in exile and many of whose nationals were fighting or working abroad made special laws allowing such nationals to divorce their wives or husbands in circumstances in which divorce would previously have been unobtainable. Norway, for example, permitted the grant of divorces in England, without notification to a person in Norway being divorced, where there had been long separation. Such temporary measures lapsed after the return of these governments to their own countries.

In Germany the Hitlerite principle of racial discrimination was carried into the domestic relationship of husband and wife and divorce was freely granted on the ground simply that the party from whom a divorce was sought was of Jewish or partly Jewish extraction; such divorces were encouraged in accordance with the German theory of racial contamination by the introduction of Jewish blood. Such divorces ceased to be obtainable at the end of World War

II, but the number of divorces granted under the remaining principles of German law increased sharply from 1945.

In the U.S.S.R. the 1936 marriage and divorce code remained substantially unchanged but official disapproval by the highest political and governmental authorities of what was called "sexual hooliganism" effectively reduced the numbers of applications for divorces and helped to strengthen the marriage bond in practice, though it remained as easily severable in theory as before.

The most notable and permanent of divorce and marriage law developments occurred in Eire in 1937 when constitutional enactments pledged the support of the new sovereign state to the institution of marriage in the most definite terms and prohibited the dissolution of marriages in that country. Foreign divorces were recognized in Eire only where they were valid under the law of the country of domicile of the parties; and neither party to such a dissolved marriage could remarry within the Eirean jurisdiction during the lifetime of the former spouse. Foreign decrees of nullity were not generally recognized. In Eire itself nullity of marriage and decrees of judicial separation could still be pronounced but there could be no divorce. This change, at first sight startling, was a natural consequence of the Roman Catholic religious background of the newest European sovereign state. Marshall, George Catlett

Marshall (1880–), U.S. army officer, was born at Uniontown, Pa., on Dec. 31, 1880. Commissioned second lieutenant of infantry in Feb. 1901, after completing his studies at Virginia Military institute, Lexington, Va., and at the Army Staff college, he advanced through the grades to brigadier general in 1936. He was with the U.S. expeditionary forces in France in 1917 as chief of operations of the 1st army and as chief of staff of the 8th army corps. After the war he served as aide-de-camp to Gen. John J. Pershing for five years. From 1924 to 1927 he was stationed in China. He was appointed commander of the 8th infantry in 1933.

On Sept. 1, 1939, the day Adolf Hitler invaded Poland, Marshall was made chief of staff and was promoted to the rank of full general. An advocate of aid to Britain and of military conscription, he directed and co-ordinated the enormous task of building up the U.S. army after enactment of the Selective Service bill. During World War II he attended the major international Allied conferences, including those of Casablanca, Cairo and Tehran, and conferred with military officers on all the fighting fronts. Marshall was promoted, in Dec. 1944, to the new five-star rank of general of the army.

In the inquiry report of Aug. 29, 1945, assigning responsibility for U.S. unpreparedness at Pearl Harbor, Gen. Marshall was charged with "failure in his relations with the Hawaiian department," but Pres. Harry Truman and Secretary of War Stimson defended Marshall's leadership. In Nov. 1945 Marshall relinquished his post as chief of staff to Gen. Dwight D. Eisenhower. Later that month he was named ambassador to China, replacing Major

Gen. Patrick Hurley. In Chungking Marshall succeeded in effecting a temporary truce in the civil war between Chungking nationalists and the Chinese communists. Granted the permanent rank of general for life, Marshall was appointed a member of the national defense council in March 1946.

On Jan. 7, 1947, he was appointed U.S. secretary of state, succeeding James F. Byrnes.

Marshall Islands

The Marshall Islands, largely atolls, were of little value and little concern to the civilized nations of the world till World War II began shaping up in the 1930s, at which time their military value became a consideration. Holding the islands under a League of Nations mandate, Japan closed them to the world and secretly began fortifying them in the middle 1930s. Military security was so tight that when the Allies found themselves at war, they had little information about the strength and nature of the island fortifications.

The archipelago, forming the southeast extremity of a 2,500-mi. island barrier, aided Japan in harassing United States shipping to Australia and in cutting it off from the beleaguered Philippines. It also furnished "anchored aeroplane carriers" and submarine bases, from which Japanese forces could operate to discourage attack. Eniwetok and Kwajalein were especially useful to the Japanese, furnishing air bases and vast reef-protected anchorages for vessels of all sizes.

When Eniwetok and Kwajalein were taken by U.S. task forces in Feb. and March 1944 they were put to use as staging and repair bases for operations against the Marianas and subsequent campaigns. Kwajalein became one of the principal stops for air travel between Hawaii and all points in the Southwest Pacific and the far east.

Bikini atoll, being somewhat isolated, was chosen by the U.S. navy as the site for testing two atomic bombs, in an operation known as "Crossroads," in July and early Aug. 1946. In each test a fleet of ships of various classes was left at anchor, without crews, in Bikini lagoon, and subjected to the effect of an atomic bomb, the first bomb being detonated above water, the second under the surface. Several ships were sunk in each test. On Aug. 16, Vice-Admiral W. H. P. Blandy, chief of Operation Crossroads, announced he was moving his testing base to Kwaja-

lein because of "persistent radioactivity." Preceding the tests the natives, 164 in number, were moved to Rongerik atoll, where seabees helped them build new huts in a well-designed village. The displaced islanders also were given several life rafts and their outrigger canoes, used in fishing, were moved for them to the new location. Seabees also built them a church and a meeting house. These islanders told of the departure from Bikini of missionaries, whom they called "Bostons," in 1940, when the Japanese began converting Bikini into a rehabilitation centre for convalescent troops.

Postwar government of the Marshalls was under direction of a senior U.S. naval officer with a staff of specially trained U.S. administrators. Objectives of the administration were to provide education, training in sanitation and health, medical services, to reconstruct war damaged property, to establish self-governing communities, to develop gardening where soil permitted, and generally to assist natives in becoming economically independent.

The native population of the islands, estimated at 15,000 in 1885, had dropped to about 5,000 under the Japanese, who brought in several thousand of their own civilians in addition to military personnel. Japanese military and civilian populations were largely removed after the Marshalls were fully occupied following Japan's surrender.

The Japanese-mandated Marshalls were placed under U.S. strategic trusteeship by unanimous vote of the United Nations security council on April 2, 1947. (See also PACIFIC ISLANDS, MANDATED.)

Martin, Joseph W., Jr.

Martin (1884-), U.S. legislator, was born at North Attleboro, Mass., on Nov. 3, 1884, the eldest son in a blacksmith's family of eight children. After graduation from high school he became a reporter for the *Attleboro Sun* and the *Providence Journal*. In 1908 he became publisher of the North Attleboro *Evening Chronicle*, and four years later he was a member of the Massachusetts

Natives of Bikini atoll in the Marshall Islands being evacuated by LST to Rongerik atoll on March 11, 1946, in preparation for "Operation Crossroads," the army-navy atom bomb tests

house of representatives. From 1922 to 1925 he served as executive secretary of the Republican state committee. Elected to the U.S. house of representatives first in 1925, Martin became well known as a shrewd parliamentarian and political strategist. After being named Republican leader of the house in 1939, he solidified the minority party into a formidable opposition to the New Deal. Wendell Willkie selected Martin as chairman of the Republican national committee in July 1940 to succeed John D. M. Hamilton. Martin resigned the chairmanship after the elections of Nov. 1942. Continuing as minority leader in the house, he was chosen chairman of the Republican national convention in April 1944.

Maryland

A south Atlantic state, Maryland is one of the original 13 states, popularly called the "Old Line state." Area 10,577 sq.mi., of which 9,887 sq.mi. are land. Pop. (1940) 1,821,244: urban 1,080,351 or 59.3%; rural 740,893 or 40.7%; white 1,518,481; nonwhite 302,763; foreign-born 81,715. On July 1, 1944, the bureau of census est. the civilian pop. of the state at 2,127,874. Capital, Annapolis (pop. 1940, 13,069); other cities: Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,802).

State officials at the beginning of the decade 1937-46 were: governor, Harry Whinna Nice (Rep.); comptroller, William S. Gordy, Jr. (Dem.); attorney general, Herbert R. O'Connor (Dem.).

The 1938 session of the legislature passed Maryland's first income tax law (one-half of one percent on all incomes with the same exemptions, generally, as provided by federal law); strengthened the University of Maryland; added to the powers and area of the Washington Metropolitan District commission in order to provide for growth of Washington suburbs; provided for state use of prison-made goods; incorporated the town of Greenbelt, Prince George's county, a \$15,000,000 federal housing project; authorized the creation of housing authorities with condemnation powers by incorporated cities; and provided for a new state office building at Annapolis.

Sen. Millard E. Tydings, in the interest of whose defeat Pres. Roosevelt "invaded" the state in 1938, easily won the Democratic nomination in the primary and was re-elected in the general election by a record majority vote for state-wide offices. Attorney general Herbert R. O'Connor (Dem.) defeated Gov. Harry W. Nice, who stood for re-election on the Republican ticket. Other officials elected were J. Millard Tawes (Dem.), attorney general, William C. Walsh (Dem.) comptroller. Proposed constitutional amendments authorizing lotteries, and a graduated income tax, were defeated at the polls. With the purpose of ending the activities of the "marrying parsons" at Elkton, the state's Gretna Green, an act of the legislature requiring a 48-hour wait between the application for licence and the performance of the ceremony was approved.

In the 1939 legislative session, important laws passed included two which provided for the creation of separate conservation commissions; one to regulate oyster culture and the oyster industry; the other to regulate propagation, protection, etc. of wild fowl, game and "inland" fish. The state welfare department was reorganized. The old county and district coroner system was replaced by

a department of post-mortem examiners headed by an unpaid commission. A legislative council was created to collect information concerning the state government, supervise the interim work of committees and prepare a legislative program in the form of recommendations for the next session. The new state office building in Annapolis designed to house all state offices was completed and occupied. (Ed. EL.; X.)

In the 1940 presidential election, Roosevelt received 385,546 votes and Willkie 269,544; the Socialist party 3,967, Communist 1,216. Seven constitutional amendments and two state referenda were voted on in November. Four amendments and one referendum were approved. They provided for a people's court in Baltimore city and counties and an additional circuit judge; salaries of judges and public officers were declared not exempt from income taxes. A legislative act changing the state Industrial Accident commission was approved by referendum, and reorganization was announced.

The 1941 biennial session of the legislature met from Jan. to April; 1,481 measures were introduced and 937 were passed, of which 82 were vetoed by the governor. The new legislative council established in 1939 held hearings, issued research reports on proposed legislation and made its first report to the legislature. Of 118 bills sponsored by the council, 99 were enacted into law. These included bills placing a state-wide ban on fireworks, regulating instalment selling, providing for roadside control and changing publication notices for constitutional amendments. Thirty obsolete or duplicate laws were repealed on recommendation of the council. A law was passed providing for a board of natural resources to co-ordinate activities of several state departments concerned with conservation, and the board was organized by the governor. The unemployment insurance law was modified, and numerous tax and motor control laws were passed. The Woman Suffrage amendment was belatedly ratified.

Governor O'Connor was re-elected in 1942 for a second term by a narrow margin; the total vote cast was 333,136, as compared with 486,472 in 1938. The Democrats lost two of the six house of representatives seats. Seven constitutional amendments were voted on at the November election and four were approved. The most important were: (1) authority for the legislature to standardize fees for clerks of courts and registers of wills; (2) provision that the state roads commission condemn and immediately take property needed for highway purposes subject to court review; (3) provision for additional compensation for members of the general assembly (increased pay from \$5 per diem to \$1,000 per year). The amendments voted down related to juvenile court jurisdiction, publication of proposed constitutional amendments and establishment of regulations for bequests to churches.

The legislature met for its biennial session, Jan. to April 1943. Important bills passed included a constitutional amendment reorganizing the court of appeals—as recommended by a committee report. The juvenile court of Baltimore was reconstituted so that all juvenile delinquents would be dealt with in the department of welfare. Provision was made for construction of two chronic disease hospitals. The conservation program was strengthened by a bill providing for a co-operative crab-conservation program with Virginia. A report by a special committee led to legislative scrutiny of the budget and a revised budget estimate by the governor. Another bill gave a bonus to school teachers and state employees and an emergency measure reduced the income tax 33% for 1942 and 50% for the 1943 tax. (C. B. S.; X.)

A special session of the legislature in 1944 provided for absentee voting of members of the armed services. At the general election of Nov. 7, 1944, the popular vote was 315,490 for Roosevelt, 292,949 for Dewey. Millard E. Tydings, Democrat, was re-elected to the U.S. senate. At the same election voters ratified proposed amendments to the constitution relating to: the reorganization of the court of appeals; the assignment of judges of circuit courts and other judges by the court of appeals; the compensation of the state's attorney; the creation of the Baltimore Redevelopment commission; the advertisement of proposed amendments to the state constitution. A proposed amendment repealing article 38 of the state declaration of rights was rejected. The article prohibited transfers of property to religious bodies or their officers without approval of the general assembly.

The regular biennial session of the legislature held in March 1945 passed a motor vehicle financial responsibility act designed to encourage motorists to ensure against accident liability.

William Preston Lane, Jr., Democrat, was elected governor in 1946 for a four-year term, to begin on Jan. 8, 1947.

Masaryk, Thomas Garrigue

Masaryk (1850-1937). Czechoslovak statesman, philosopher and sociologist, was born in the Moravian border town of Hodonin, March 7, 1850. Son of a coachman, he studied philosophy at the Universities of Vienna and Leipzig and at the latter met his future wife, an American. For several years his time was devoted to producing philosophical treatises, but he was elected to the Austrian *reichsrat* in 1891 and became a political leader. World War I provided an opportunity to publicize the cause of the Czechs on an international scale. This work was climaxed in 1918 when Czechoslovakia was declared an independent nation. Local recognition of his services came with successive elections as president until his resignation in Dec. 1935. Despite many political disagreements among the Czechs, he remained a subject of national reverence until his death near Prague, Sept. 14, 1937.

Masella, Benedetto Aloisi

Cardinal Masella (? -), titular archbishop of Cesarea of Mauritania and apostolic nuncio to Brazil, was born at Pontecorvo, Italy, and entered the diplomatic service of the holy see as a young priest. Although of Italian birth, Archbishop Masella was better known outside his native country, having spent 35 years of his priestly career in other lands. He served as chargé d'affaires to the Lisbon nunciature from 1910 to 1919, and as nuncio to Chile from 1919 to 1927, when he was named apostolic nuncio to Brazil. Archbishop Masella was proclaimed a cardinal by Pius XII at the consistory of Feb. 18, 1946.

Massachusetts

A north Atlantic state of the United States, Massachusetts was admitted to the union Feb. 6, 1788, popularly known as the "bay state." Area 8,257 sq.mi., including 350 sq.mi. of inland water. Population (1940) 4,316,721, of which 3,859,476 was urban, 457,245 rural; 4,257,596 white, 55,991 Negro. In 1945 the population was estimated at 4,493,281. Capital, Boston (770,816). Other principal cities are Worcester (193,694); Springfield (149,554); Fall River (115,428); Cambridge (110,879); New Bedford (110,341); Somerville (102,177); Lowell (101,389); and Lynn (98,123).

For the third successive biennium the government of Massachusetts was entrusted to an executive department predominantly Democratic and a legislative department decisively Republican in 1937. Inaugurated on Jan. 6, 1937, for a two-year term were the following elective officers: governor, Charles F. Hurley (Dem.); lieutenant governor, Francis E. Kelly (Dem.); secretary, Frederic W. Cook (Rep.); treasurer, William E. Hurley (Rep.); attorney general, Paul A. Dever (Dem.); auditor, T. H. Buckley (Dem.).

During the 1937 legislative session more than 2,500 petitions were considered and several important bills were

enacted. It was voted to submit to popular referendum the question of biennial instead of annual sessions of the legislature. The people approved biennial sessions. By another act a state pension system for judges was established. The legislature also ratified interstate flood compacts for the Merrimac and Connecticut valleys, created a commission to study communist, fascist and nazi activities within the state, voted to permit absentee voting in town elections and abolished the law providing for pre-primary conventions of the major political parties. A move to abolish capital punishment was defeated, as were bills to legalize a state lottery, to tax chain stores, to impose a 2% sales tax, to ratify the national child labour amendment and to bar married women from civil service positions.

The 1938 legislative session established a new record for length of session, meeting from Jan. 5 to Aug. 24. During the session, 498 acts and 91 resolves were passed and approved by the governor. Among them were bills allowing voters in each county to decide whether betting on horse and dog racing should be continued for the next four years; abolishing breach of promise suits; amending the Boston charter so that the mayor might become immediately a candidate to succeed himself; reducing from 4½ to 4% the rate of interest on unpaid local taxes; extending the term of the police commissioner of Boston from five to seven years; protecting motorists against misleading signs relating to the price of motor fuels; reorganizing the state department of mental diseases; recodifying Boston building laws; revising state securities laws so as to bring oil royalties under the supervision of the Public Utilities commission.

In the hurricane and flood of Sept. 21, 1938, 45,000 Massachusetts families suffered losses in varying degree. The number of persons lost or dead was 187; those suffering injuries totalled 462; 445 permanent homes and 2,767 summer homes were destroyed in addition to 847 barns and 2,943 out-buildings. The number of families needing Red Cross assistance was 6,094. It was estimated that \$650,000 worth of fishing boats, equipment, docks and shore plants were destroyed, and the loss to farmers of the state \$13,096,000. Trees blown down aggregated 1,000,000-000 board feet of lumber, valued at \$17,000,000.

(H. T. C.; X.)

The Republicans, led by Governor Leverett Saltonstall, completed in 1939 their first year in control of the executive department after six years of Democratic rule. Inaugurated in Jan. 1939, for a two-year term, were the following elective officers in addition to Saltonstall: lieutenant governor, Horace T. Cahill (Rep.); secretary, Frederic W. Cook (Rep.); treasurer, William E. Hurley (Rep.); attorney general, Paul D. Dever (Dem.); auditor, Russell A. Wood (Rep.).

The 1939 legislative session convened on Jan. 4 and was prorogued on Aug. 12. During the session 517 acts and 74 resolves which had passed the legislature received also the approval of the governor. Twenty-two acts and one resolve were returned by the governor without his approval. The principal battle of the session was over the taxation program proposed by the governor, a large portion of which finally passed. The governor also succeeded in reorganizing several state departments through removals, forced resignations and legislation.

In the 1940 presidential election Roosevelt secured 1,076,522 votes; Willkie 939,700; Thomas (Soc.) 4,091; Browder (Com.) 3,806; Aiken (Soc. Labor) 1,492; Babson (Prohibitionist) 1,370. Governor Saltonstall was also re-elected. No

session of the legislature was held in 1940, under the biennial plan adopted in 1939.

Reporting on his first two years of administration, ending Dec. 31, 1940, Governor Saltonstall noted that 215 of the 351 cities and towns had reduced their tax rates in 1940. The two years, 1939 and 1940, brought a total of 681 new industrial concerns and concerns requiring substantial expansion. The state debt during the two years was cut \$19,000,000, nearly one-half, the largest reduction in 40 years. Flood control work was completed by the state on 600 mi. of streams in addition to flood control work by the federal government. The state ranked among the five leading states in war production and had one of the largest national guards of any state in proportion to population. At the 281 vocational schools in the state more than 50,000 people were receiving training, much of which was directed to the needs of the defense program.

In 1941 the legislature was in session for 171 days, the longest session in its history. Legislation for defense and war constituted most of the action. The net state assessment on municipalities for 1941-42 was the lowest since World War I, with the exception of 1931-32. The net direct debt of the commonwealth between 1938 and 1941 was cut down from about \$40,700,000 to \$15,937,000. When the state national guard was taken into army service, a new state guard of 6,000 was organized, equipped, trained and ready for home police duty by the end of 1941. One of the most productive acts of the governor was the formation of the Massachusetts Industrial Committee for National Defense. Civilian organization for home protection and regulation of consumption was rapidly completed under the direction of the committee on public safety.

In the Nov. 1942 election Governor Saltonstall was elected for his third two-year term and the Republican party again won most of the elective state offices. State officers included Horace T. Cahill, lieutenant governor; Frederic W. Cook, secretary of state; treasurer and receiver general, Francis X. Hurley; Thomas J. Buckley, auditor; Robert T. Bushnell, attorney general. In January Governor Saltonstall proclaimed a state of emergency and assumed the full powers provided by law, this action being ratified and continued by a special session of the legislature. Massachusetts was the first state in the union to begin active civilian defense preparations through the establishment of a state Committee on Public Safety. Closely related to the work of this committee was the state plan for handling any emergency through co-operation of all military and nonmilitary state agencies. Through the Military Information centre in the state house, the Disaster Relief commission was on a 24-hour-a-day basis in 1942.

During the 1943 session of the legislature the senate consisted of 26 Republicans and 13 Democrats, and the house of 139 Republicans and 97 Democrats. Legislation was largely concerned with provisions to facilitate the eventual postwar adjustment. Five special commissions, requested by the governor, were directly employed in preparation for the problems of reconversion. The Post-War Readjustment committee worked with private industries in their postwar planning. The Commission on Emergency Public Works assembled and evaluated plans for public works by the state and stimulated cities and towns to plan projects. The Post-War Highway commission studied the order of priority for projected new highways.

Turbine gears for U.S. warships of World War II, manufactured at the General Electric plant in Lynn, a leading industrial centre of Massachusetts

A committee on transportation studied the revamping of the Boston transportation system. The committee on veterans' rehabilitation and re-employment was charged with the task of assisting returning veterans. The legislature also set up a commission as a liaison agent between the executive and legislative branches in dealing with the problems of returning veterans. The net direct debt of the state government by Nov. 30, 1943, was further reduced to \$5,663,861, and the combined debt of the state's cities and towns was less than \$215,000,000, a drop of more than \$100,000,000 from the 1932 peak.

In April 1944 Governor Saltonstall called a special session of the legislature to pass legislation necessary for the servicemen's ballot. In the state election of November the following officers were elected: governor, Maurice J. Tobin (Dem.); lieutenant governor, Robert F. Bradford (Rep.); secretary of state, Frederic W. Cook (Rep.); attorney general, Clarence A. Barnes (Rep.); treasurer, John E. Hurley (Dem.); auditor, Thomas J. Buckley (Dem.); senator, Leverett Saltonstall (Rep.). Governor Saltonstall was elected U.S. senator by a plurality of 561,668, the largest given any state candidate after Calvin Coolidge. In the presidential election Franklin D. Roosevelt polled a plurality of 113,946 votes.

Constitutional amendments in 1944 restored the practice of holding annual sessions of the legislature, empowered the legislature to prescribe terms and conditions under which felons might be pardoned by the governor and council, provided for simplification of description of measures presented for referendum and provided for absentee voting by qualified voters physically disabled. The financial position of both state and municipal governments was exceptionally good. Even with the new bond issue of \$1,250,000 early in 1944 for airport development, the net direct debt on June 30, 1944, was only \$6,541,615. The combined debt of cities and towns at the close of the year was approximately \$189,000,000. (L. SL.; X.)

The 1945 session of the legislature voted to pay the state's more than 500,000 veterans of World War II a \$100 cash bonus; voted \$15,000,000 for expansion of Logan International airport at East Boston; voted \$15,000,000 for development of the port of Boston and authorized establishment of a new port authority with sweeping powers. The legislature also approved a six-year highway program which was to cost approximately \$153,000,000.

The net direct debt of the state on July 1, 1945, was \$4,593,775 and the combined debt of the cities and towns at the close of the 1944-45 fiscal year was \$170,000,000.

During the legislative session of 1946, several notable

Mathematics

The development of mathematics, in common with that of most other subjects during the period 1937-46, was to a large extent dominated by World War II. The volume of mathematical publications was sharply reduced after 1939. Many mathematicians were engaged in non-mathematical work, or in mathematics directly needed for war research. There was increased interest in problems of applied mathematics. However, in most countries progress continued to be achieved in pure mathematics as well, even during the war. The tendencies of the preceding few years continued. More and more, fields which had formerly

been regarded as quite distinct began to run together, to borrow one another's ideas and methods, until it was often difficult to decide to what field a given publication could properly be said to belong. Another aspect of the same tendency was increased generalization and abstraction. Particularly in the fields of algebra, geometry and topology, and analysis, this tendency led to much experimentation and irregular growth; it was hard to name, year by year, the most outstanding individual contributions, but at the end of a few years it could be seen that significant progress had been made.

Little mention needs to be made of individual countries; except for physical difficulties, the tendencies were much the same in each. This is well exemplified by the case of Japan, which had no mathematical contact with the English-speaking countries from the end of 1941 until 1946. When Japanese mathematical publications for the war years reached the U.S. in 1946, it was found that a number of important results had been reached independently by workers in both countries. The only important mathematical school which ceased work completely was that of Poland, where some half of the prominent mathematicians lost their lives and no work was done until late in 1945. Restoration of normal communications showed that much more mathematics than had been anticipated was accomplished in the other occupied countries of Europe. Germany had been, until 1933, one of the two or three leading mathematical centres; but by 1941 there were more prominent German mathematicians in other countries, particularly the U.S., than in Germany; German mathematics suffered a corresponding decline.

Mathematical congresses inevitably decreased in number. The International Mathematical congress, scheduled for 1940, was postponed indefinitely. The Fifth International Congress for Applied Mechanics was held in 1938 in Cambridge, Mass.; the sixth, in the autumn of 1946 in Paris, was the first postwar international mathematical congress of any size. A number of important local congresses were held before 1940, notably the semi-centennial celebration of the American Mathematical society (N.Y., 1938). A few others, of more limited scope, took place even during the war. The first Canadian Mathematical congress was held in 1945.

Foundations.—One of the most striking results of recent times in the foundations of mathematics was obtained in 1938 by a former Austrian, working in the U.S. The status of the two propositions known as the axiom of choice and the continuum hypothesis had been in doubt for many years. One form of the former states that if we have a collection (in general, infinite) of different sets of objects, we can form a new set containing exactly one object from each set. This axiom appeared to be essential for many mathematical results, but its use was viewed with suspicion by many mathematicians. Even by using the axiom of choice, it was not possible to establish the continuum hypothesis, a statement, too technical to describe here, about the cardinal number of the set of all real numbers. The new discovery was that, if the other axioms of the theory of sets are consistent, then they remain consistent if the axiom of choice and a generalized continuum hypothesis are added. Thus, unless set theory itself is self-contradictory, the axiom of choice and the continuum hypothesis, if not derivable from the other axioms, can be added without doing any harm (a situation analogous to the "parallel postulate" of Euclidean geometry).

Number Theory.—Noteworthy progress was made in some of the oldest problems of the subject. In 1742 Christian Goldbach conjectured that every even number

Dr. J. P. Eckert, Jr., co-inventor of the electronic numerical integrator and computer, first revealed by the U.S. war department in 1946. The machine was expected to revolutionize modern engineering by its great speed in solving mathematical problems

(greater than 2) can be represented as a sum of two primes. No progress was made until it was proved in the early 1930s that every integer can be represented as the sum of not more than a certain (large) number of primes. In 1937 a Russian proved that every sufficiently large odd number is the sum of three primes (so that every sufficiently large even number is the sum of at most four primes).

Waring's problem, dating from 1770, is the problem of finding a number $g(k)$ such that every positive integer is the sum of $g(k)$ k th powers. While the existence of a $g(k)$ was proved by David Hilbert in 1909, it was only in the period under review (1937–46) that a complete solution was obtained for most values of k ; only the values 4, 5 and 6 were still in doubt. Except when $k=2$, only the smaller numbers require the full number of k th powers; let $G(k)$ denote the numbers which suffice to represent all sufficiently large integers. Considerable progress was made in improving previous estimates for $G(k)$. In one of the most difficult cases, $k=3$, a Russian proved that $G(k)$ is at most 7 (while $g(k)=9$). The study of Waring's problem was particularly active in the U.S., the U.S.S.R., Great Britain, China and India.

In a typical problem in "geometry of numbers" a plane is covered by a network of congruent parallelograms, and one asks, for a given geometrical figure K , what is the maximum area of a parallelogram such that K necessarily contains at least two vertices of the network. Results of this kind have many applications. The subject received many significant contributions, particularly in Great Britain, where new methods were developed which for the first time allowed nonconvex figures K to be considered.

A problem on the density of the sum of two sequences of integers, after defying repeated attacks for ten years, was solved in 1942 (U.S.). A proof of a generalized "Riemann hypothesis" and novel work on class fields (France) showed the power of modern algebraic concepts and methods in problems of algebraic number theory. Progress was also made in the theory of partitions of integers and in connection with Fermat's last theorem (U.S.).

Algebra.—In the rapidly developing field of abstract algebra, cultivated especially in the U.S., the U.S.S.R. and Japan, many new concepts were developed and applied to other fields as well as in the subject itself. There were important developments in the theory of partially ordered sets and lattices, which were found to have applications in such diverse fields as logic, group theory and operators in abstract spaces. Both finite and continuous groups were extensively studied. Much of classical analysis was found

to extend to functions defined on a wide class of continuous groups (work initiated in France and the U.S.S.R.). Several generalizations of the concept of a group were introduced and investigated.

Topology.—Topology is basically the study of those geometrical properties which are preserved by one-to-one continuous transformations. It has two principal subdivisions, the topology of sets of points and combinatorial topology, each of which has its own distinctive methods. In both branches, many deep results were established, but the most significant of them are too technical to be described here. Point set topology was especially cultivated in Poland (up to 1939) and the U.S.; combinatorial topology (during the period under review) in the U.S., the U.S.S.R., the Netherlands and Switzerland. The concepts of combinatorial topology, originally developed for Euclidean spaces, were found to be capable of extension to much more general abstract spaces. Important relations between topology and the theory of groups were developed. Topological methods were also increasingly being applied in problems of analysis and differential geometry. The attention attracted by topology and algebra was indicated by the fact that of the ten annual colloquium lectures of the American Mathematical society in 1937–46, five were on topics in topology and three in algebra.

Geometry.—Classical differential geometry and the differential geometry of generalized spaces continued to be studied extensively, particularly in Europe. As noted above, modern topological methods began to show their utility in this subject. Important developments took place in algebraic geometry, where the use of modern algebraic methods (particularly in the U.S.) for the first time put some of the principal general results on a secure logical basis.

Analysis.—In the theory of functions of real variables, much work was done, particularly in the U.S., on the difficult problems connected with the area of a curved surface. A curve or a surface can be looked at as an entity defined either analytically or geometrically; for curves, the two concepts lead to equivalent definitions of length, while for surfaces the corresponding definitions of area are radically different. By 1946 the theory of the area of an analytically defined surface had reached a rather satisfactory state, while that of a geometrically defined surface was still quite unsatisfactory. The problem was attracting much attention in 1946.

In the calculus of variations, progress was made in the theory of the problem of Plateau, and the so-called inverse problem of the calculus of variations was solved (U.S.).

Much attention was paid to the theory of differential equations, both ordinary and partial. Potential theory (originally the theory of solutions of Laplace's equation) was extensively developed and generalized, particularly in France. New methods were found for the study of nonlinear differential equations (U.S., Great Britain, U.S.S.R.). These are of importance in many branches of applied mathematics where it is necessary to improve the classical linear approximations; much of this work was connected with war problems and was still unpublished in 1946.

In the theory of functions of complex variables, although numerous special problems continued to be studied, there was an increased tendency toward the application of modern algebraic and topological methods (Germany, Scandinavia, U.S.). Notable advances were made in the theory of functions of several complex variables, particularly in

the theory of automorphic functions (U.S., China).

The field of functional analysis originally developed out of the study of integral equations and equations in infinitely many unknowns. It is usually regarded as part of analysis, but in its modern aspects it might also be considered as a branch of topology. The study, first of "spaces" whose "points" are functions, and then of similar spaces as abstract entities, was one of the most active fields of mathematics, particularly in the U.S., U.S.S.R. and Japan. The spaces known as Banach spaces were especially prominent, since they seemed to be the most useful for applications to other parts of mathematics. Partially ordered spaces were also studied. The theory of normed rings, which are both Banach spaces and rings (in the sense of abstract algebra), was extensively investigated; this theory seemed to have great potentialities for use elsewhere in analysis.

A closely related subject is ergodic theory, which deals with measure-preserving transformations and is of fundamental importance for dynamics and statistical mechanics. The subject was given fresh impetus by the introduction of new methods, brought into intimate connection with the theory of abstract spaces, and developed into an independent discipline.

Probability and Statistics.—In probability, the classical limit theorems were greatly extended and improved. The theory of stochastic processes, of importance in many physical problems, was further developed (U.S., U.S.S.R., Scandinavia, France). Theoretical statistics, particularly the theory of statistical tests, made rapid progress under the impetus of wartime needs; in particular, new methods in quality control, of sufficient practical importance to have been military secrets, became available to the mathematical public at the end of 1945.

Relativity.—The kinematical relativity of E. A. Milne was further explored, principally in Great Britain; a new theory of relativity propounded by G. D. Birkhoff was under investigation in the U.S. and Mexico.

Applied Mathematics.—Problems in elasticity, plasticity and hydrodynamics, particularly the hydrodynamics of compressible fluids, were extensively investigated in the principal countries engaged in the war. Probably by no means all the results obtained were generally available in 1946, but enough had been published to make it clear that significant new methods had been developed and that formerly intractable problems could now be handled. Another aspect of the wartime pressure for rapid solution of difficult problems was the development of several types of new high-speed computing machines. Many new mathematical tables were computed, particularly by the Mathematical Tables Project sponsored by the National Bureau of Standards (U.S.).

Publications.—Several new series of mathematical books were inaugurated in North America: *Princeton Mathematical Series* and *Annals of Mathematics Studies* (Princeton); *Mathematical Surveys* (American Mathematical society), *Mathematical Expositions* (Toronto). However, the number of books published declined during the war in all countries. Germany, once the centre of the mathematical book world, published little but new editions of older books. A great number of standard advanced mathematical treatises were reprinted by photographic processes in the U.S.

Three research journals of international scope were founded in Argentina, one in Brazil and one in Portugal. The increased interest in applied mathematics was attested by the founding of the *Quarterly of Applied Mathematics* (U.S.) and *Applied Mathematics and Mechanics*.

(U.S.S.R.). *Mathematical Tables and Other Aids to Computation* (U.S.) was the first journal to deal exclusively with the field indicated by its title. The American Mathematical society founded *Mathematical Reviews*, an international abstracting journal, in 1939. (See also PHILOSOPHY.)

BIBLIOGRAPHY.—A complete bibliography of mathematical publications is given in the abstracting journals *Zentralblatt für Mathematik und Ihre Grenzgebiete*, vols. 15–21 (1937–40) and *Mathematical Reviews*, vols. 1–7 (1940–46). For general information see *Bulletin of the American Mathematical Society*, vols. 43–52; E. T. Bell, *The Development of Mathematics*, 2nd ed. (1945).

Matsuoka, Yosuke

Matsuoka (1880–1946), Japanese statesman, was born March 3, 1880, in Yamaguchi. At the age of 13 he went to the United States, where he was converted to Christianity and was graduated from the University of Oregon law school in Eugene in 1900. Returning to Japan, he entered the foreign service and held several consular posts in China. Later he was elected to the diet, and from 1935 to 1939 he was president of the South Manchurian railway. In 1932, he defended his country's seizure of Manchuria before the League of Nations.

In June 1940 Matsuoka became foreign minister in Prince Konoye's cabinet and on Sept. 27, 1940, he signed the Tripartite pact with Germany and Italy. In March 1941 Matsuoka journeyed to Europe where he conferred with Hitler. In June 1941 Matsuoka was dropped from the cabinet. According to documents subsequently found in German confidential files, Matsuoka had assured Hitler that Japan would go to war as soon as possible.

Matsuoka was arrested Nov. 19, 1945, and was indicted with Hideki Tojo and others in April 1946 by the Allied International Military tribunal on charges of war crimes. His death was announced on June 27, 1946, while the trial was still in progress.

Meat

United States meat production had been moving steadily upward from 1900 with periods of notable decline in 1920, following World War I and in 1935, after the great drought. A high record of production had been reached in 1934, more than 18,000,000,000 lb., followed by a sudden drop to 14,400,000,000 lb.—less than the 1935–39 average. In 1937 the total was only 15,700,000,000 lb. By 1939 the total was back to 17,500,000,000 lb. and a steady increase followed to a record of 24,648,000,000 lb. in 1944. Favoured by ample feed supplies from accumulated grains under the ever-normal granary program and better-than-average weather for pastures, stockmen were able to make a quick start to meet the increasing demand

created by World War II. Record and near-record feed-grain crops for five years permitted a continuous increase in hog numbers and also an upswing in cattle numbers to a new high total. Sheepmen also built up their herds. In terms of liveweight of animals on farms and ranches, the total rose from about 34,000,000,000 lb. in 1939 to the top of 46,000,000,000 lb. in 1943. The increased feed crop was a result of wider use of hybrid seed corn, good yields of other feeds and the release of land formerly used to grow feed for horses and mules as they were replaced by tractors. Greater efficiency in livestock production was also a factor. The number of pigs saved per litter increased steadily. Better control of diseases and increased output from better feeding resulted. Bigger lamb and calf crops were recorded.

By 1944 the prospect of the end of World War II and consequent declining foreign demand for meats led to a down-turn of the cycle; by Jan. 1946 the number of all cattle, cows and sheep on farms was less than a year earlier, and the number of hogs was less than in the two record years of 1943 and 1944. The total of animal units on farms showed a decline and indicated that the World War II expansion was completed. The production of meat was expected to continue high because of the slaughter of the animals being sold as herds were reduced.

World War II brought about an increased demand for meat for the U.S. military forces and also for civilians. The high level of employment increased consumers' incomes and they demanded better food with a larger proportion of meat in their diets. This brought about rationing and other distribution controls even though there was an increasing supply of meat. Lend-lease created an extra demand that amounted to 6% of the supply in 1942, 9.3% in 1943, 6.5% in 1944 and an even greater part in 1945–46. The armed forces required about 16% of the total meat output during the five years 1940–45. Yet the supply was large and civilians consumed more meat than in pre-war years—a high of 150 lb. per capita in 1944 as compared with 125 lb. (1935–39 average). The war made the United States a net exporter of meat. Before the war live cattle were imported from Canada and Mexico amounting annually to several hundred million pounds of meat.

Cattle prices were slightly higher from January to June 1946 than in the same period a year earlier. During the period when price control lapsed in July 1946 beef cattle prices rose to the record level of \$30.25 per 100 lb. for a few loads at Chicago. When price ceilings were restored on Sept. 1, prices declined but were still higher than in June; after permanent decontrol they rose again.

The proportions of the different kinds of meat changed more than usual through the decade. In 1935–39 the percentages of each was as follows: Beef 43%, veal 6%, pork (excluding lard) 45% and lamb 6%. Roughly, cattle provided half and hogs and sheep the other half of the supply. In 1944, the year of highest production (24,648,000,000 lb., not including poultry), beef amounted to 37%, veal 7%, pork 52% and lamb 4%. The popular idea that beef was particularly scarce in 1944 and 1945 was not supported by the facts, since the production amounted to more than 9,000,000,000 lb. in both years. Veal production was a third above prewar, pork 75% higher, lamb and mutton 20%. Production had not been increasing so fast as the general increase in U.S. population for several years before the war. The rapid increase during the war years provided for the great increase of the supply for civilians at the same time that military and lend-lease and other

Meat-hungry shoppers jamming a Chicago butcher's shop following the decontrol of prices in Nov. 1946

export demands were taking about one-fifth the total supply.

The production of pork made the greatest advances during the decade. The pig crop increased from 62,000,000 head in 1937 to 122,000,000 head in 1943. At the same time the average weight of hogs slaughtered rose from 231 lb. per head in 1940 to 264 lb. in 1943 but declined to 255 lb. in 1946. A factor in this great increase in hogs was the support prices set at a relatively higher level and effective over a longer period. This rapid expansion of hog feeding used more feed than was being produced or was available from stocks. Farmers, therefore, had to curtail breeding operations in 1943 to bring hog numbers into better relation with feed supplies. The 1944 spring pig crop was 25% and fall pigs 34% below the respective crops in 1943. Consequently, the slaughter in the 1944-45 marketing year declined from 97,000,000 head to 75,000,000 head. The production of hogs moved in cycles of three to five years as the size of the corn crop varied. Hog raising can not be expanded so rapidly as it can be decreased, therefore when there is a sudden decrease in the corn crop the number of hogs is quickly reduced. From 1938 through 1943 there were large corn crops and hog numbers increased steadily. In 1943 the decline began with the reduction in feed supply.

Beef is supplied not alone by cattle raised for beef; about one-third of the supply comes from animals from dairy herds. Dual-purpose cattle continued to supply about 15% of the beef during the decade 1937-46. Only about 50% of the beef came from cattle kept primarily for beef. The fattening of cattle on grain and concentrates in feed-lots serves as a means of quickly increasing the total supply of beef.

About 5,000,000 head were fed on the average during the decade, and it was estimated to be about 12% of the total production of beef and veal. Feeders added about

1,600,000,000 lb. to the weight of animals put through the feed-lots.

The production of beef cattle moves in cycles of 10 to 15 years. Dairy cattle have less violent changes in numbers and increased more rapidly during the decade than did beef cattle. Dairying tended to grow with the increase in total population as milk consumption increased. The drought of 1934-36 caused a low point in the cattle cycle when thousands of animals were slaughtered by the Federal Surplus Relief corporation to prevent their loss from starvation. The year 1937 found total cattle numbers at a low point, fewer in number than in 1914 at the beginning of World War I. With the outbreak of World War II stockmen began to increase their herds; numbers on farms rose rapidly from about 66,000,000 head in 1937 to a peak of 82,364,000 head in 1944. About 41,000,000 head were strictly beef cattle, of which about 60% were grown in the 17 western states. The number of beef cattle in the central corn belt states did not increase so fast as in the northern plains states.

The number of dairy cattle increased steadily from 1937 to 1945, and the amount of meat provided by aged cows and calves formed a considerable part of the increasing meat supply. Calf slaughter increased after 1941; herds had been built up from about 9,200,000 head in that year to 13,620,000 head in 1944.

The part of the meat supply provided by sheep as mutton and lamb played a small part in the total increase. The total number of sheep did not increase after 1943 and in 1946 was smaller than in 1937. Sheep raising was at a low level from 1914 to 1928 but had recovered to above the level of 1900-14 by 1931. Shortage of labour and greater cost of production for lambs than other livestock affected the industry adversely. The uncertain future of wool prices led to the reduction of flocks in the range country after 1942.

Poultry meat made up a large part of the shortage in many regions. The average production in the prewar

period 1935-39 was 2,675,000,000 lb. of chickens and turkeys; other fowl were so few in number as to be unimportant. The prewar average of all meats from animals was 16,182,000,000 lb. in 1935-39. At the height of production in 1944, poultry meat amounted to 4,020,000,000 lb. compared to a total of animal meats of 24,670,000,000 lb. Prewar per capita consumption was 125.6 lb. of animal meats, 17.9 lb. of chicken and 2.6 lb. of turkey. In 1944 animal meat consumption had risen to 148.4 lb. per capita, compared with 23.6 lb. of chicken and 3.4 lb. of turkey.

The prices of all meat animals received by farmers in 1937 were at a peak after a period of advances beginning in 1933, the lowest point after 1910. A price decline continued through 1938 and the advance began which continued until 1943. Prices of all meat animals averaged about the same at the outbreak of World War II as in 1914 before World War I. Hog and sheep prices were lower in 1939, while beef cattle and lamb were higher. Beef cattle prices alone rose to higher levels than in World War I. The prices of animals were relatively more favourable to the stockmen than in the period 1916-20.

Retail meat prices moved up slowly from the low point in 1940. Prices declined between 1937 and late 1941, and the total cost of all foods was below the base level of 1935-39 during the three years 1938-40 inclusive. Meat prices, in comparison with the 1935-39 average, rose to 108 in 1941, 126 in 1942, 134 in 1943, then declined to 130 in 1944 and 131 in 1945 and remained at that level through early 1946. These prices represented the legitimate market. Had there been reliable statistics on the meat sold in "black market" channels, the average would have been much higher in 1944-46, when a considerable part of the total supply was reputed to be moving through illegal markets. Areas dependent upon in-shipment of meat were particularly hard hit in 1945 and 1946.

A crisis in the meat trade was reached in June 1946 when the shipments of livestock to markets reached a low level. The Big Three packers reported at one time that they had purchased only 8 head of cattle at a time when about 10,000 head had been shipped to the Chicago stockyards. These packers stated that they could not pay prices high enough to make purchases because of OPA ceilings. Meat packing plants on the eastern seaboard closed.

After July 1, when the OPA was inactive for several weeks, there was a heavy run of livestock to market as prices soared to record heights. There was an abundant supply of meat in all markets. Retail prices asked were higher than consumers would pay and then there was a recession. When OPA was restored, the shipments of livestock ceased almost entirely. A severe meat shortage developed in the late fall. After final price decontrol late in 1946, however, the supply again became plentiful.

Government subsidies for meat animals were paid after June 1943 for the announced purpose of holding down the price of meat to consumers and maintaining or increasing returns to producers and thereby fostering the supply. A third objective was to ensure meat processors against losses caused by government price control. Slaughterers were forced to comply with the ceiling prices to be eligible for subsidy payments. Subsidies were paid to non-federally inspected slaughterers on a part of their output to obtain better meat distribution in deficit meat areas. When ceiling prices of meat were reduced about 3 cents per pound retail in 1943, slaughter payments of \$1.10 per 100 lb. on cattle, \$1.30 per 100 lb. on hogs and 95 cents per 100 lb. on sheep were begun. This was called the "roll-back" of meat prices. Various changes were made from time to time

through 1943-46. This program was under the Reconstruction Finance corporation and amounted to a total of more than \$1,500,000,000 up to the spring of 1946. In May 1945 the Commodity Credit corporation began the payment of direct subsidy payments to producers. These payments began with the payment of 50 cents per 100 lb. for cattle of 800 lb. or more to induce feeding to heavier weights. These subsidies amounted to about \$14,500,000 in 1945 and \$2,800,000 on cattle in Jan. 1946 alone. The subsidy program for sheep and lambs began in Aug. 1945 at varied amounts, \$1.50 to \$2.50 per 100 lb. for 65 to 90 lb. lambs, and \$2.15 to \$3.15 for lambs weighing more than 90 lb.

The CCC paid out about \$10,000,000 in 1945 under this program.

World Production.—World meat production declined as a whole during the decade 1937-46 and most rapidly during 1945-46. In the United Kingdom meat production in the 1945-46 season was 800,000,000 lb. below the prewar average level of 2,800,000,000 lb.; and the 650,000,000-lb. average imports from Europe were not available during World War II. While larger amounts were imported from both North and South America, the United Kingdom's consumption remained at about 80% of the prewar level. Canada, New Zealand and Australia limited meat for their civilian populations in order to ship more to Britain. In Europe total meat production had dropped from a prewar average of about 25,200,000,000 lb. to 14,200,000,000 lb. in 1945-46, largely as the result of military operations and the lack of imported feed grains. Lack of feed reduced pork production in Denmark about one-half. In the soviet union great losses were due to the German invasion, but by 1945 livestock numbers had increased so that the meat ration was increased materially. The world's totals were maintained by expansion of production in the U.S., Canada and Argentina largely because of the large feed supplies. The great demand for grains for relief needs was a limiting factor in the recovery of livestock production in all countries. A survey of the world's cattle numbers in 1945-46 showed the total to be about 709,800,000 head as compared with an average of 723,000,000 head in 1936-40. Medicine

In 1935, a German investigator named Gerhard Domagk announced the development of a dark red dye substance which was called sulfanilamide. This discovery opened the era of the antibiotic drugs in medicine. It marked a period in which greater advance was made against the infectious diseases as causes of death than ever before in the history of medical science. The opening of this path caused research workers everywhere to embark on the creation of modifications of sulfanilamide, so that by the end of the decade 1937-46 hundreds, if not thousands, of preparations had been developed, and many infectious diseases were being brought completely under control.

Sulfonamides.—The sulfonamides contain in common a chemical group including sulphur, oxygen and nitrogen. The exact method of action of these drugs on the germs that respond to them was still uncertain at the end of the decade. Apparently, however, they interfere with the proper functioning of certain enzyme systems that are essential to the growth and survival of the bacteria. If the sulfonamide drug is present in moderate amounts, the multiplication rate of the germs is decreased. This is known as bacteriostasis. If the drug is present in large amounts, as, for instance, when the sulfonamides are applied to an infected wound, the germs may actually be killed. This is known as a bactericidal effect. Investigations have shown that one of the derivatives of the vitamin B complex, known as para-aminobenzoic acid, acts to prevent the action of the sulfonamide drugs. Apparently also there are substances present in pus and in necrotic tissue which can interfere with the action of the sulfonamides. For that reason infected wounds are first cleaned by removal of the pus and the dead tissue so that the sulfonamide may act effectively.

Extensive study on various forms of the sulfonamides showed that some act more effectively against some germs, others against other germs. Physicians are likely, therefore, when a patient is in a hospital, to have a bacteriologic diagnosis of the infection in order to give the drug that has the best effect. When there are infections with the haemolytic streptococcus, sulfadiazine is the drug of choice; sulfanilamide, second; sulfapyridine, third and sulfathiazole fourth. Infections with the pneumococcus are best treated with sulfadiazine, with sulfathiazole second choice and sulfapyridine third choice. Gonorrhoeal infections respond best to sulfathiazole, with sulfapyridine second choice. The original sulfanilamide is not used in the treatment of infections with the gonococcus if these improved sulfonamide drugs are available. For staphylococcus infections, sulfadiazine or sulfathiazole may be used. Sulfadiazine is also considered to be the first choice for infections with the meningococcus, although the other sulfonamides are effective.

Once the usefulness of these products was established, new techniques were developed for giving the sulfonamides by other methods than direct injection into the blood or application to infected wounds. Preparations were developed to be given by mouth, for use as lozenges in infections of the mouth and throat and for use in the form of sprays mixed with air or oxygen and as vapours. Such vapours are used in respiratory diseases like infections of

the bronchial tubes and lungs, of the sinuses, nose and throat.

Studies continued to be made with the use of the sulfonamides in attacks against various diseases caused by viruses. Apparently they have some effectiveness against trachoma, follicular conjunctivitis and venereal granuloma.

Interesting also was the use of sulfonamides as a preventive of epidemic infections of the nose and throat. In many army camps all soldiers were given daily dosages of sulfadiazine, and the incidence of infection was greatly lowered.

Crystalline sulfonamides were developed for local use against certain bacterial infections, particularly those caused by streptococci and staphylococci. New antibacterial preparations were also developed which could be used locally with the sulfonamides to great advantage.

Tyrothricin.—Subsequent to the development of the sulfonamides new importance attached to tyrothricin, an antibiotic developed by René de Dubos from a bacillus called *Bacillus brevis* found in the soil. Tyrothricin consists of at least two substances, gramicidin and tyrocidin. This drug is not used in the interior of the body either by injection or by mouth because of its toxic character. It is, however, of value in treating superficial ulcers caused by Gram-positive germs, that is to say, germs which stain with the Gram stain. Apparently it does not exert any effect unless it comes into direct contact with the infecting agents.

Penicillin.—Moved by the needs of the British army in World War II, British investigators, including particularly Sir Alexander Fleming, Howard W. Florey and E. Chain, developed the use of a mould called penicillin which had been found by Fleming some years before to be especially effective in preventing the growth of pus-forming germs. Penicillin is a solid extract of organic nature obtained from these moulds, and the extract possesses the property of inhibiting the growth of certain germs and even destroying them. The extract can be prepared in the form of salts of penicillin, including sodium, calcium and ammonium salts. For this work the investigators mentioned received the Nobel prize in medicine.

Penicillin was found especially effective against infections with the staphylococcus, the diphtheria organism, the streptococci, pneumococci, gonococci and meningococci. Its value in the treatment of gonorrhoea and syphilis particularly made it seem likely that for the first time there was a possibility of complete elimination of these venereal diseases. Especially important was the use of penicillin in overcoming subacute bacterial endocarditis, a condition formerly considered invariably fatal but from which, by the end of the decade, perhaps one-third of those infected were recovering.

Streptomycin.—Later streptomycin, another antibiotic drug, was developed by Selman A. Waksman. This became the best preparation for use against tularemia, certain forms of tuberculosis and other infections. Indeed it was predicted that streptomycin might prove to be a sovereign remedy against tuberculosis. It was pronounced the most effective remedy yet discovered against infections in the urinary tract.

Still other antibiotics included subtilin, derived from the *Bacillus subtilis*, patulin and bacitracin. There were no definite limitations on the total number of antibiotics that might ultimately be developed, since there are many thousands of moulds, each of which was being investigated as to its effectiveness against certain forms of infection.

The antibiotics opened a new approach to the attack against infections. By their use the death rate from pneumonia was reduced from more than 25% to an average of

7%. Among U.S. troops in World War II, the death rate from pneumonia was less than 1%, as contrasted with more than 20% in World War I.

Other New Remedies.—Among other new remedies was tridione, especially effective against some forms of epilepsy and other convulsive disorders. Experts in the field of epilepsy who tested its use on many cases, checking the use with the electro-encephalogram or so-called brain wave machine, reported that it was especially useful in averting completely attacks of petit mal but not quite so effective against the serious convulsions of grand mal epilepsy.

Research on the allergic disorders revealed that the allergic attack is accompanied by a release of histamine into the blood. The French first experimented with a preparation which was an antihistamine and found it useful against asthma, urticaria, hay fever and food sensitivities. The French product was called antergan but was revealed to be somewhat toxic. U.S. investigators produced preparations equally beneficial and much less toxic. The first of these, known as benadryl, was to produce attacks of sleepiness in some patients. Later, pyribenzamine was found even more effective in such cases, particularly in urticarias, and to be even less toxic than benadryl. Investigations continued, and it was apparent that a great advance had been made in treatment of the allergies.

The endeavour to find a drug useful against excessive activity of the thyroid gland, such as occurs in hyperthyroidism, led to the development of products called thyroid genes. Among these was thiouracil and other modifications with a variety of names. These drugs apparently have the ability to diminish the pulse rate, excessive perspiration and other manifestations of excessive action of the thyroid. They also lower the basal metabolic rate. A considerable number of people, however, develop a sensitivity to thiouracil and respond with temporary loss of great numbers of white blood cells, thus becoming easily infected. This condition is known as granulocytopenia and also as agranulocytosis. Investigators found that penicillin may be used simultaneously with thiouracil, thus protecting the patient against infections. Because of the manifest dangers, warning labels were placed on all prescriptions for this product.

Malaria was the major threat during World War II. Under the Division of Medical Sciences of the National Research Council and the Committee on Medical Research, some 20,000 preparations were devised and tested. Early in the war atabrine, known in Great Britain as mepacrine and listed in the United States *Pharmacopoeia* as quina-craine, was considered most effective. U.S. production rose from 50,000 tablets per year to more than 2,000,000,000 tablets annually. Later, two other preparations were found specifically effective against certain forms of malaria—chloroquine and pentaquine. Still later, members of the 8-aminoquinoline group of compounds—one known as SN 13276—were reported actually curative in malaria caused by infection with the *Plasmodium vivax*.

A new narcotic called demerol and known in Europe as dolantin began to be widely used in U.S. medicine. Investigations indicated that it was a powerful and quick-acting narcotic. Claims were made that the product was less addictive than opium and morphine. Indeed it was claimed to be as relatively innocuous as codeine. Nevertheless, the bureau of narcotics of the United States government reported a considerable number of cases of primary addiction to demerol, which was placed under the Harrison Narcotic act. In the meantime investigations continued with other narcotic preparations believed to be less toxic

and less addictive than demerol.

Curare, commonly called the South American arrow poison, was developed as an extract in pure form called intocostin. This drug is used to control muscle spasms in infantile paralysis and in other forms of spastic paralysis. It was used to great advantage for soldiers who suffered wounds of the spinal cord. It was used also in the treatment of babies born with brain haemorrhage which caused them to be spastic infants. Particularly useful was the employment of curare to bring about maximum relaxation before surgical operations. Curare used in this way made possible the use of smaller amounts of inhalant anaesthetics like ether, ethylene and nitrous oxide-oxygen with more profound unconsciousness and relaxation.

The U.S. chemical warfare service reported that a by-product of mustard gas which acted directly on the tissues that produce white blood cells could be taken into the body and used against diseases like leukaemia and Hodgkin's disease, in which there is an enormous increase of the white blood cells. This product is, however, quite toxic. By the end of the decade it had not been reported effective in curing either leukaemia or Hodgkin's disease in the advanced stages. Nevertheless, the product was the most promising thus far found, and unquestionably would have wide use on an experimental basis until its values and limitations could be determined.

The British, in the course of their attempt to control poisoning with lewisite, developed a product commonly called British anti-Lewisite or BAL, valuable for overcoming the symptoms of poisoning with mercury and arsenic. Thus one of its special uses is as an antidote against arsenical poisoning and against reactions to arsenic in patients given large doses of arsphenamine or similar preparations in the treatment of syphilis.

The development of the atomic bomb focused attention on substances made radioactive by the use of the cyclotron. These are known as radioactive isotopes. Radioactive iodine was used to overcome excessive action of the thyroid gland. This product could be taken by mouth in solution. Other radioactive isotopes, such as those of calcium, were used to carry radioactivity into the bones. Radioactive sodium can be injected into the veins and its progress traced through the veins into various portions of the body. Thus the rate of circulation can be measured, and it can be determined whether or not there are inflammations of the lining of the blood vessels, which slow the circulation. Radioactive isotopes of strontium and potassium were used because these elements tend to localize in certain organs. Radioactive phosphorus was used particularly for conditions affecting the blood and seems to have had exceeding success in conditions in which there is a tremendous increase of red blood cells, as in polycythaemia.

Among the most frequent of conditions developed during World War II was gastric ulcer, the increase being associated with psychosomatic causation. Anxiety and fear play a major part in the occurrence of gastric ulcer. Among methods of treatment new to this condition were the feeding of neutralized, filtered and preserved gastric juice taken from normal people, also the feeding of mixtures of the amino acids. However, the standard treatment of neutralization of the acid of the stomach by alkaline powders continued to be considered most frequently successful.

The wide spread of infection with fungi such as ringworm focused attention on specific methods of prevention and treatment of this condition. Investigators in the navy reported that a combination of undecylenic acid (2%),

zinc undecylenate (20%) and ordinary talcum powder was the best preventive powder against the fungous infection of the feet. Ringworm infestation of the scalp also spread widely throughout the United States and was believed to be associated with the practice of children, sitting in the movies, of rubbing the back of their heads on the chair. Ringworm of the scalp was detected by the use of the ultraviolet ray, and treatment included complete removal of the hair with direct application of fungicidal remedies, among which undecylenic acid had a high place. (See also CHEMOTHERAPY.)

Preventive Medicine.—Outstanding in the prevention of disease during World War II was the application of prophylactic vaccines against a great variety of tropical disorders, including particularly vaccines against typhus, yellow fever and dysentery, also smallpox, tetanus, typhoid and paratyphoid fevers. Additional vaccines were made available against other plagues to which soldiers might be exposed.

In the course of vaccination against yellow fever, more than 70,000 men developed jaundice. Search for the cause of the jaundice revealed that a virus had apparently been transmitted in the serum used in the vaccine by one of the agencies which prepared it. This led to the detection of a new condition called epidemic hepatitis with a specific virus. Elimination of the use of serum in the preparation of the vaccine resulted in ending the outbreak of jaundice associated with vaccination against yellow fever.

A vaccine was developed against the virus A and B types of influenza. Demonstration of the usefulness of this vaccine on millions of members of the United States army preceded release of the product for use among the public. By 1946 this vaccine was being manufactured in millions of doses and probably would be effective in preventing such devastating outbreaks of epidemic influenza as had occurred in the past. In most instances such epidemics had a high mortality because of the secondary invasion of the body by virulent streptococci of the type of the haemolytic streptococcus and the streptococcus viridans. Since such streptococci were now controllable by the use of the sulfonamide drugs and the antibiotics like penicillin and streptomycin, the probability prevailed that outbreaks similar to those which devastated mankind every 25 years in previous centuries would either not occur or would be controlled.

Significant in the field of preventive medicine was the development and use of blood derivatives for the prevention of a considerable number of diseases. The American Red Cross, which had previously purchased and distributed for free use by the people of the United States all of the gamma globulin developed through the collection of blood in blood banks, followed that procedure by purchasing all of the surplus blood plasma. This surplus was considered to be sufficient for two years. It was to be distributed through state health departments. Gamma globulin is effective as a preventive of measles and also is useful in lessening the severity of an attack of that disease. This is especially important when the globulin is used in institutions such as schools and orphanages where younger children ill with other diseases may contract measles by exposure to modified cases. Gamma globulin was also found useful in lessening secondary complications in mumps as, for instance, in orchitis, inflammation of the testes, or ovaritis, inflammation of the ovaries, both serious complications. Blood plasma was useful in preventing mortality from shock, burns and haemorrhages.

A conspicuous development in the field of preventive medicine was the use of DDT (dichloro-diphenyl-trichloroethane) in sprays and through widespread dissemination by the use of aeroplanes. Thus great areas were freed from the menace of the mosquitoes that carry malaria and flies known to be carriers of various other forms of infection. In fact, the development of DDT and a host of related products represented one of the greatest advances ever made in medical science. By the use of this product it became possible to control epidemics of typhus. The manner in which the preventive medicine section of the U.S. army stopped in its early stages a threatening epidemic of typhus in Naples was hailed throughout the world. In this procedure, DDT powder was sprayed in all of the slum areas of Naples as well as into the clothing and over the skin of all of those who might be exposed to contact with the lice that spread typhus.

In connection with the control of malaria, aerosol bombs were developed which could be broken in a tent in which soldiers were sleeping and thus prevent bites by insects that carried disease. So effective were the anti-malarial procedures of the forces of the United States that many islands of the Pacific were made free of such insect pests. On one island where clouds of mosquitoes had incapacitated troops it became possible after several months for soldiers to sleep without even the protection of mosquito netting. Swamps were drained, DDT was sprayed by aeroplane, aerosol bombs were used in the tents and thus complete control was established.

Conspicuous also was the development of a new poison for destroying rats, known by the contracted name ANTU. With this preparation the menace of plague, spread by fleas from rats, was also controlled and did not prove to be at all a hazard to U.S. troops working in plague-infested areas.

Among the new diseases which attracted medical attention and which demanded particularly the service of epidemiologists was a wide variety of atypical pneumonias caused by viruses. Investigations showed that pigeons or other birds frequently carry a condition called ornithosis, a disease caused by a virus and similar to the disease known as psittacosis or parrot fever. The viruses produce an inflammation in the lung. They are not susceptible to attack by the sulfonamide drugs or by penicillin or streptomycin. Fortunately, however, except for psittacosis, they are not severe. The conditions are best detected by the symptoms that they produce and by the use of the X-ray. People who take care of pigeons are frequently infected with ornithosis. Because of the possibility that pigeons might be responsible for the spread of virus pneumonias, the suggestion was made that pigeons in all cities be destroyed and that steps be taken to eliminate these birds by control of feeding and shelter. Subsequent investigations revealed, however, that few people were infected with the virus carried by pigeons except those directly working with these birds. Patients with the virus pneumonias were usually given the antibiotic drugs for the prevention of secondary infections with the germs which these drugs can control.

In the prevention of the spread of infections with respiratory diseases, two new procedures were found especially valuable. One was the use of aerosols or sprays placed on blankets or floors of barracks and schools. The aerosols are mists containing antiseptic drugs which can be sprayed in amounts sufficient to control to a considerable extent the dissemination of the germs that are contained in droplets in the air. When anyone sneezes or coughs, thousands of droplets containing germs are spread

Seriously wounded British veterans of the North African front in 1942 being loaded into an air ambulance for transportation to large base hospitals in the rear

into the air. The use of oils and the control of floating dusts by the use of oil mops was also found to be helpful in keeping down the germ population of the atmosphere. Effective also was the use of ultra-violet rays for disinfection of the air, particularly in surgical operating rooms but also in children's wards of hospitals and in orphanages and institutions. Studies were made as to the best methods of using ultraviolet for this purpose. Special apparatus had to be developed, also means of protecting those exposed to ultra-violet from overdosage.

Another technique for the control of respiratory disease was the administration of daily doses of sulfonamide drugs, usually sulfadiazine, to persons assembled in considerable numbers in barracks, schools and such places. A single dose given daily proved to be efficient in lessening by one-half the amount of infection as manifested by sore throats, fever and colds.

Toward the end of the war much excitement was occasioned by the announcement that a Russian, Alexander A. Bogomolets, had developed a serum called ACS, or the anticytotoxic serum, which he claimed would be useful in a variety of infections, in prolonging life and in controlling cancer. The serum was based on the idea that the connective tissue cells of the body are involved in processes which tend to shorten life by giving out a toxic substance. The Bogomolets serum proposed to immunize the tissues of the body against this toxic substance. Actual investigations conducted in the United States failed to confirm the claims made for this product in relation to any control whatever over cancer, nor did it appear to be useful in prolonging life. Bogomolets himself died suddenly at the age of 64. Some studies made on the use of the anticytotoxic serum in the healing of wounds and fractures seemed to indicate that it might have a beneficial effect, but these studies were made on small numbers of animals and human cases and seemed to require much additional evidence before the real value of the product could be determined.

Experiments with infected wounds revealed that an

antiseptic substance called furacin was useful in eliminating many of the germs not affected by penicillin. Thus combinations of furacin and penicillin were much more effective in the control of such wounds than either product used alone.

Conspicuous among new infections which became widespread was infectious hepatitis. This condition, already mentioned under the discussion of the jaundice associated with vaccination against yellow fever, was formerly confused with many other forms of jaundice. When it occurred in epidemic form, the condition was called chronic catarrhal jaundice. Investigations indicated that the virus responsible can be transferred through the injection of infected blood. One outbreak was definitely traced to the use of contaminated drinking water from infected wells, and other outbreaks seemed to be associated with the use of the swimming pool.

Whooping cough was formerly considered uncontrollable by the use of any vaccine or serum. Later, studies of the nature of the organism responsible for whooping cough and new methods of preparation of vaccines permitted the approval of vaccines against whooping cough with especially prepared pertussis vaccine.

Diphtheria appeared throughout the world in exceedingly severe forms, in some instances uncontrollable by any of the diphtheria antitoxins available. It became necessary to isolate these new forms of the diphtheria germ so as to prepare new concentrated diphtheria antitoxins capable of controlling these forms. Through the advances made in the creation of vaccines and antitoxins, the National Institute of Health established official potency tests for the following antitoxins and vaccines: botulinus antitoxin, diphtheria antitoxin, *Clostridium histolyticum* antitoxin, *Clostridium oedematiens* antitoxin, staphylococcus antitoxin, tetanus antitoxin, scarlet fever streptococcus antitoxin, perfringens antitoxin, vibron septique antitoxin, diphtheria toxin-antitoxin mixture, diphtheria toxoids, tetanus toxoids, antidysenteric serum, antimeningococcic serum, type specific antipneumococcic serums, bacterial vaccines prepared from the typhoid bacillus, diphtheria toxin for the Schick test and scarlet fever streptococcus

toxin for the Dick test and for immunization.

Vitamins.—During the decade 1937-46, investigations of the vitamins were focused on finding new ones and determining new uses for them. The vitamins were now considered to be substances essential for the maintenance of normal metabolic functions. Not identical with the more familiar nutrients like proteins, carbohydrates, fats and minerals, the vitamins are not synthesized in the human body in normally adequate amounts and therefore must be furnished to the body by a supply coming from without.

By the end of the decade, more than 20 naturally occurring compounds with vitamin activity had been isolated and identified. There were also available preparations in pure synthetic form with the same properties which occur in nature.

As a result of investigations, scurvy, beriberi, rickets, pellagra and xerophthalmia were attributed with certainty to the lack of specific vitamins. Thus these vitamins came to be known as the antiscorbutic vitamin (vitamin C), the antineuritic vitamin (thiamin), the antirachitic vitamin (vitamin D) and the pellagra-preventing vitamin (nicotinic acid).

Chemical, physical and microbiologic methods were developed for determining the presence of vitamins in pharmaceutical products. For some vitamins, including vitamin D, studies still remained to be made on living animals to determine their effectiveness. The Health Organization of the League of Nations sponsored the preparation and distribution of standards for the well known vitamins, and international units were developed for each. The units established by the United States *Pharmacopoeia* are identical with the international units of the Health Organization of the League of Nations.

Thiamin appeared to be the vitamin most frequently deficient in the diet of Americans. An adult requires about 300 international units, equivalent to about one milligram of pure thiamin, per day.

Para-aminobenzoic acid was found especially effective against certain rickettsial disorders, such as scrub typhus or tsutsugamushi disease. Pyridoxine was related to metabolism and had extensive experimentation in muscular disorders.

Because of a shortage of certain vitamins in ordinary diets in the United States, much attention was given to the use of enriched bread containing extra amounts of calcium, thiamin and iron.

Mixtures of vitamins derived from the vitamin B complex were found useful in the treatment of diabetes because of the special virtues of these derivatives in the oxidation of sugars. Vitamin C was found to be useful in encouraging healing of wounds. Healing is much slower when there is a vitamin C deficiency, but it is delayed in the absence of any of the essential elements in the diet.

Vitamin D was found to be not a single substance but a variety of substances (sterols). These were used in a number of conditions, including deficiency of the parathyroid glands, also against rickets and in a variety of spasmodic disorders related to a deficiency of absorption of calcium.

Especially significant among vitamin studies were those made to determine which are necessary for the growth of germs in cultures. Claims were made that vitamin E, tocopherol, was useful in preventing and controlling a variety of disorders of the nervous system and also certain weaknesses of the tissues of the heart. None of these claims could be confirmed.

Some physicians reported that the regular use of fairly large doses of vitamin E by women in the menopause helped to reduce the serious symptoms in a manner similar to the use of estrogenic hormones.

Severe deficiencies of vitamin A in the diet were associated with changes in the cells on the outer surface of the skin, replacing the ordinary cells with hardened material called keratin of the type in fingernails and calluses. Similar changes may occur in the eye.

Vitamin P was claimed to have a special relationship to fragility of the blood vessels. Apparently this vitamin does not affect the fibrinogen or the blood platelets but controls certain forms of haemorrhage because of its relation to the capillaries.

Newest among the vitamins during the decade was folic acid, also known as the *L. casei* factor, which was found to be especially related to the production of red blood cells. The claim was made that it could substitute for liver extract in the treatment of pernicious anaemia. The drug was also especially effective for the anaemia associated with sprue.

Vitamin K was discovered and named by H. Dam of Copenhagen in 1935, when he discovered a fatal haemorrhagic disease in newly hatched chicks which could be cured or prevented by giving a certain fraction of hog liver or alfalfa. This substance was developed as vitamin K₁ and vitamin K₂. The common name menadione was developed for these products by the Council on Pharmacy and Chemistry. Apparently a deficiency in the absorption of vitamin K results in the lack of the substance called prothrombin in the blood. Vitamin K is not properly absorbed when the flow of bile is obstructed. Prothrombin is not formed by the liver unless vitamin K is available. When a deficiency of prothrombin is due to obstruction of the flow of bile, surgeons give bile salts with vitamin K. Investigations proved also that the incidence of haemorrhage in newborn babies could be reduced by administering vitamin K to the mother before delivery. Customarily this is injected, and the use of amounts as small as 1½ to 2 milligrams insure that the newborn infant has a normal amount of prothrombin in the circulating blood. (See also VITAMINS.)

Surgery.—War experiences greatly improved surgery of the chest. In World War I, 70% of men wounded in the chest died of their wounds. In World War II the mortality rate was reduced to 20%. This advance in surgery of the chest was credited to several contributing factors. Surgical teams were developed, and patients were brought promptly to such competent surgeons. Immediate first aid, including blood transfusions, the use of sulfonamide drugs to prevent infection and prompt administration of measures to overcome shock, brought the patient with wounds of the chest to the surgeons in better condition to undergo serious operative procedures. Reports indicated that failure to apply similar techniques resulted in the same high mortality for wounds of the chest in the German army in World War II as in World War I. The experience with surgery of the chest in the earlier war was reflected in advances in chest surgery in civil life.

Conspicuous were operative procedures on the heart and the blood vessels. A small percentage of babies are born with an anomalous condition of the heart and the circulation of the blood, so that an adequate amount of blood does not go through the lungs and receive oxygen. These children become "blue babies." Drs. Alfred Blalock and Helen B. Taussig at Johns Hopkins Hospital, Baltimore, Md., developed a surgical technique for rerouting the blood so as to get a sufficient amount through the lungs.

They operated on many children with severe degrees of cyanosis or blueness and brought the condition under control so as to permit normal development of the child. In the operation one of the large systemic arteries is connected to one of the large arteries that goes to the lungs. Cases were brought to Johns Hopkins from all over the world—in some instances with funds raised by newspaper campaigns. Other surgeons proposed improvements on the original technique. A clamp was developed with which it became possible to shut off to a large extent the blood passing through the aorta (the large blood vessel going directly from the heart) and thus permitting anastomosis or joining of the artery going to the lung directly with the large vessel from the heart. Several recoveries were announced in severe cases in which infants were extremely blue and death was expected momentarily.

A new approach to the prostate gland added a fourth technique to those already used for removal of an enlarged or cancerous prostate gland. The new technique was called the retropubic extravesical technique. The approach to the gland is from the back of the lower portion of the body, and by this technique the operation stays away from the urinary bladder.

Many advances in technique were proposed. In operations on the gall bladder and the tubes that carry the bile from the gall bladder to the intestines artificial metal tubes of vitallium were substituted for the bile ducts. In other instances the bile duct was reconstructed over a vitallium tube so that, after healing, the tube passed on through the intestine and from there passed out of the body.

Conspicuous among developments in reparative surgery were the creations of banks of tissues to be used in plastic repairs. Especially noteworthy during World War II was the utilization of the traveling graft. Thus flaps of skin may be moved from one portion of the body to another where extra skin is needed. Methods were developed for tattooing skin grafts with pigment so that they would blend with the surrounding skin. Surgeons reported transplantation of whole sections of a toe to take the place of a thumb or of portions of fingers that had been lost. Following experience with the creation of banks for the storing of blood plasma and other derivatives of blood, banks were developed for the storage of such tissues as the cornea of the eye, pieces of nerves to be used in nerve grafts, portions of the skin, pieces of cartilage and pieces of bone. Refrigeration of grafts of skin may keep them available for a long time. In plastic surgery procedures the blood derivatives called thrombin and fibrin foam, derived from whole blood, helped to promote the attachment of the new graft to the place of its location.

Experience in war also improved greatly surgery of the oesophagus. Operations were performed chiefly for cancer. Mortality from such operations previous to the war approximated 50% whereas such procedures at the end of the decade approximated 20% mortality.

Much of the improvement in surgery was related to the advances in knowledge of anaesthesia, so that patients could be kept free from pain and unconscious for longer periods of time (*See below*). The tissues are greatly relaxed, and restorative measures using blood and protein substances aid recovery. In this connection also the anti-clotting substances were greatly used by the surgeons. The product called dicoumarol and the one called heparin helped to prevent postoperative thrombosis—clotting—and embolism—movement of a clot through the blood stream. By application of the antibiotic drugs before and during operative procedures, secondary infections were minimized and mortality rates were tremendously reduced.

Secondary peritonitis after operation for removal of the appendix became exceedingly rare. Operation on the mastoid because of infection almost disappeared from a good many hospitals. One institution for the care of children reported only five cases of operation on the mastoid in 1946, whereas 20 to 25 patients were always in the hospital for operation on the mastoid and aftercare five years previously.

The advancement in orthopaedic surgery was reflected in improved operations for restoration of function of the limbs, including transplantation of muscles, ligaments and nerves. New splinting devices were developed, and the tendency to early movement with the use of a so-called ambulatory splint became pronounced. The Stader splint involves insertion of pins into the fragments of bone and the interlocking of these pins with an adjustable splinting device. With this device persons whose bones have been fractured can walk or use the arms within one or two days after the fracture occurs.

Following suggestions coming from abroad, U.S. surgeons adopted as routine procedure the injection of local anaesthetics directly into joints for the relief of pain and into areas in which bursas had become inflamed, making movement difficult. This became a common treatment for bursitis and for severe sprains.

Among new methods which were highly developed was the use of electrocoagulation during operative procedures. Dissection by a heated knife or wire became a standard method for removal of tumors of the brain, for operations on the gall bladder and other procedures in which bleeding may be profuse. For the control of haemorrhage the application of thromboplastin and fibrin foam developed into a life-saving measure.

For removal of enlarged prostate glands in the absence of cancer, a common procedure was electrocoagulation and dissection by a heated knife introduced into a cystoscope. Whereas operations on the prostate gland formerly had a high mortality and involved hospitalization for months, the mortality was reduced to a few per cent, and patients were enabled to undergo the operative procedure and leave the hospital within a week.

Especially important also was the development of surgery of the nerves and blood vessels for repair and rehabilitation following serious accidents or wounds. The sewing of a torn or broken nerve is about as delicate a task as is known to medicine. In World War I doctors used linen and silk thread and also human hair for this purpose. New procedures included the use of a form of fibrin derived from clotted blood and dropped between the torn ends of nerves. The nerve is then drawn together with fine silk. Sheaths of metal and of tissue of various kinds were developed for surrounding nerves joined together.

The Russians claimed to have grafted nerves from corpses to living persons.

Operations were done on the heart of persons with angina pectoris resulting from insufficient circulation of blood to the heart muscle. In one procedure the sac containing the heart was opened and a small amount of powder rubbed on the tissue. This caused adhesions and the development of a new blood supply. Similar operations were attempted for cases of coronary thrombosis in which the blood vessels which supply the heart with blood were blocked. (*See also SURGERY.*)

Anaesthesia.—Improvements in anaesthesia were of vast benefit in promoting the science of surgery. The specialty

of anaesthesiology developed. This includes not only protection of the patient against pain and shock but also the administration of various solutions such as blood, glucose and other restorative materials before, during and after operative procedures.

Curare, the South American arrow poison, was used to produce relaxation of muscles before the giving of anaesthetics. This resulted in lessening the amount of anaesthetic required for complete relaxation and unconsciousness.

New methods of giving anaesthesia, including direct injection of anaesthetic substances into the blood, the use of anaesthetics in the spinal canal to block the nerves and the use of small amounts of anaesthetics continuously administered to maintain blocking over long periods of time, were introduced. Local anaesthetics were developed for operative procedures carried on without loss of consciousness by the patient. Combinations of sedative drugs like the barbituric acid derivatives and various anaesthetic gases also resulted in lessening the total amount of anaesthetic required.

Restorative substances like helium and oxygen were of aid also in lessening the risk of anaesthesia. New techniques were developed for the control of explosions of anaesthetic gases. (See also ANAESTHESIOLOGY.)

Obstetrics.—Outstanding among obstetrical procedures that attracted attention during the decade 1937-46 was caudal analgesia as a technique for preventing pain during childbirth. In this procedure small amounts of the preferred local anaesthetic are injected directly into the lower portions of the spine so as to block the nerves that go to the organs and areas involved in childbirth. There were reports of hundreds of thousands of cases in which women had given birth to babies under caudal analgesia without feeling pain.

The procedure is technical and requires special training which usually calls for the continuous attendance of a physician or a nurse especially trained in the technique. Childbirth with this technique must be conducted in a hospital. The tendency was more and more for women in the United States to have their babies in hospitals. Estimates indicated that more than 85% of white women had their babies in hospitals in 1946 and in most hospitals there were specially developed sections devoted to obstetrics.

Estimation of Safe Period by Temperature Record.—Studies made on the function of menstruation and ovulation indicated that a woman can determine definitely the time when ovulation occurs by taking her temperature each morning and carefully recording it. The temperature is taken by mouth, using an ordinary fever thermometer, each morning at a certain time before food or drink is taken into the mouth. The temperature is carefully recorded on a suitable cross-ruled chart. By this technique it becomes possible to establish a period of from three to five days in which there is maximum fertility. During the remaining time of the month there is almost certainly sterility. When the temperature chart is followed, there is a line which goes along evenly until just before the time of ovulation. The line rises about one day beforehand and then falls suddenly the next day. Then it rises for two more days until it reaches a base line along which it continues until the next preliminary rise before the next ovulation. The period between the first rise until the final rise—namely, a period of three to four days—is the period of maximum fertility. During this period, conception following intercourse is most likely.

Cold-room at Harvard medical school where products of fractionated human blood were stored. Already found useful for coagulation in surgery and as a control for shock, these products were explored for other medical applications

Antibiotics.—Associated with the introduction of the antibiotic drugs, new techniques used in obstetrics and some advances in obstetrical education, the mortality of women in childbirth dropped to an exceedingly low, and perhaps irreducible, figure. Indeed, secondary infection following childbirth became so well controllable that former proposals for isolated maternity hospitals, in which only patients absolutely free from infections or complications would be cared for, were abandoned.

Roentgenography.—Roentgenography developed as a valuable aid in obstetrics for determining the position of the child and the structure of the mother, for detecting with certainty the presence of pregnancy, diagnosing multiple pregnancy, verifying foetal death, determining the size of the baby, detecting deformities of the baby, estimating the size of the baby's head and determining many other similar facts.

Rh Factor.—In 1940 discovery was announced of a new factor found in the blood, known as the Rh factor. The presence of the Rh factor or of incompatibility in blood because of this factor may result in stillbirth or in a serious condition in the newborn child known as erythroblastosis. As a result of this discovery, many hospitals introduced routine examination of the prospective mother for the Rh factor. The suggestion was made for special procedures to be followed during delivery of the child in order to overcome the danger of death.

Eclampsia.—Determination of the cause of eclampsia continued to be the goal of investigators in the field of obstet-

rics. Control of this condition still depended on early detection of its onset with the application of methods for relieving the toxæmia. Most heroic of the methods of treatment was the removal of the unborn child.

Early detection of such symptoms as blurring of vision, swelling of the limbs or increase in the blood pressure may help to avert eclampsia. Pernicious vomiting may be a sign of danger.

Brain Haemorrhage at Birth.—Much attention has been given to the possibility of preventing haemorrhages in the brain of the child at birth. These methods include the administration of clotting substances such as prothrombin and vitamin K. Obstetricians, however, were convinced that good obstetrical practice was the most significant factor for this purpose. Especially important is the avoidance of excessive amounts of drugs, like pituitary extract, which produce violent, expulsive efforts in the muscles of the uterus. (See also GYNAECOLOGY and OBSTETRICS.)

Neuropsychiatry.—*Psychosomatic Medicine.*—Increased attention to the combined effects of the mind and the body in the production of disease led to the establishment of psychosomatic medicine as a specialty. Studies with this technique revealed the tremendous importance of mental factors in the causation of such conditions as ulcer of the stomach, dysenteries and colitis, disturbances of menstruation, asthma and headache. Psychosomatic techniques were introduced particularly into the practice of internal medicine, surgery and allergy. Investigators concentrated on the development of forms of psychoanalysis called "brief psychoanalysis" and requiring much less time for the determination of specific factors leading toward successful treatment.

Shock Treatment.—Continued experiments with shock treatment for mental derangement or mental depression resulted in the application of this technique for many mental conditions but particularly for depression psychoses. While investigators in some institutions preferred insulin shock and others preferred metrazol shock, the tendency seemed to be toward widespread use of electric shock.

The use of curare for producing muscular relaxation previous to the administration of convulsive shocks helps to avert fractures and other complications that occasionally develop during this type of treatment.

Lobotomy.—During the ten-year period, experiments were extended on the use of frontal lobotomy, a technique in which the skull is opened and portions of the frontal lobe of the brain are removed. Investigators reported success, particularly in cases of anxiety and emotional upsets. Most investigators, however, were inclined to the belief that this technique was extremely limited in its applicability.

The various techniques used for schizophrenia or dementia praecox revealed some success with a variety of methods in a limited number of cases but the specific cause and a specific method of treatment were not yet determined.

Narcosynthesis and Hypnoanalysis.—New methods of investigation for mental disturbances included the technique of hypnotism combined with psychoanalytic procedure and another technique in which sedative drugs of the barbituric acid series are given to the patient associated with the psychoanalytic procedure. Active hypnotism was also used to put patients into a mental state in which they would reveal through their replies to questions and through the confession technique the underlying causes of mental disturbances. As a result, many fears and anxieties associated with so-called nervous breakdowns in military service were determined. Preventive techniques were also developed leading toward proper conservation of a suitable mental

state in the aviator, the infantryman, as well as the industrial worker who is subject to special stresses.

Electroencephalography.—The so-called brain wave machine was utilized in the study of a variety of mental disorders. By the use of this device it was shown that more than 50% of the members of the immediate family of epileptics are likely to have abnormal traces in the brain wave machine. The device was found of great value in the investigation of a great variety of mental disorders as well as convulsive disorders of the nervous system.

Group Psychotherapy.—In the practice of neuropsychiatry group techniques were developed for application to improving the emotional and mental status of great numbers of people at one time. (See also PSYCHIATRY.)

Venereal Diseases.—The progress of the campaign against the venereal diseases was greater during the decade 1937-46 than in any previous period in the history of medicine. The Kahn test, the Wassermann test and similar procedures were standardized so that the diagnosis of venereal disease could be made with relative certainty. Every soldier in the United States army was given a Wassermann test. The incidence of syphilis for the general population was revealed to be about 10 per 1,000 persons. Syphilis, however, was far more frequent among the Negro than among the white population. The passing of laws controlling prostitution helped to control to some extent the spread of venereal diseases among the armed forces. Relaxation of such restrictions following the end of the war resulted in a sharp upturn in the total amount of venereal infection. New techniques for the treatment of gonorrhoea and syphilis, however, indicated the likelihood, for the first time, that these diseases might be eliminated as typhoid fever and other infectious conditions had already been brought under control.

Syphilis.—Extensive experimentation with intensive methods of treatment yielded information of vast importance for prompt recovery from syphilis. At first continuous intravenous administration of arsphenamine combined with the use of bismuth was tried, but dangers to the tissues of the body and serious reactions led to virtual abandonment of this method. Indications became clear that syphilis of the nervous system associated with the occurrence of locomotor ataxia and general paresis might be controlled through various forms of treatment. Control of such conditions began with the administration of tryparamide, an arsenical, and was followed by the use of inoculation with artificial malaria or relapsing fever and still later by the application of heat through fever cabinets.

When penicillin was first discovered, investigators in the U.S. public health service tried its effects on syphilis and indicated the possibility of checking the infectiousness of syphilis by this means. Experimentation in the armed forces resulted in standardization of techniques for the treatment of syphilis with penicillin and determination of the proper dosages for the giving of penicillin either intramuscularly or by direct injection into the veins. Thus it became possible to stop the infectiousness of syphilis in a short time and to bring about probable cure of syphilis in seven days. This was in great contrast to the former period of three or four years for the application of arsphenamine.

At the end of the decade, it was still too early to determine the completeness of the cure, but the indications were that this method of treatment could stop syphilis.

In early syphilis involving the nervous system the methods used may include penicillin combined with the use of the arsenicals and heat treatment. Especially valuable was

the application of penicillin controlling congenital syphilis; this became the method of choice.

Gonorrhoea.—New methods of treatment of gonorrhoea involved immediate application of sulfathiazole, effective in the majority of cases in controlling gonorrhoea in from 24 to 48 hours. Penicillin was also found to be effective against this organism, and the use of penicillin by the injection technique became a fairly certain method of cure.

These techniques were especially valuable in preventing the secondary complications of epididymitis, infection of the fallopian tubes in women and more remote complications like gonorrhoeal arthritis and gonorrhoea of the spine.

In U.S. army camps attempts were made to give sulfathiazole tablets to soldiers going on leave as a means of prevention of gonorrhoea. (See also VENEREAL DISEASES.)

Cancer.—Research on cancer during the decade was devoted particularly to the discovery of substances called carcinogenic, which have the power either to initiate or stimulate the excessive growth of cells of the body. A great variety of substances were included under this category as well as forces of the type of the X-ray and radium. These materials, which include tars, derivatives of tars, some of the vitamin-like substances and some glandular extracts, were tested as to their effects on the growth and metabolism of the cells which showed wild and unrestrained multiplication.

Cancer of the prostate gland and cancer of the testis in men were apparently benefited by the use of large doses of the female sex hormone stilbestrol. Similar experimentation indicated some success in controlling the spread of cancer of the breast and of the ovary in women, giving in this instance the male sex hormone. The female sex hormone was also found to be of value in preventing the spread of cancer of the prostate or testis to the bones.

Cancer of the stomach, considered among the most fatal of all forms, was progressively overcome by utilizing new techniques for early diagnosis. These involved particularly the use of the X-ray and of the gastroscope, a device for looking at the interior of the stomach and photographing its walls. If cancer of the stomach is discovered sufficiently early, modern surgical procedures permit removal of portions, if not all, of the stomach with recovery of the patient.

Cancer of the lung was also being controlled by surgery, in some instances with removal of a lobe or of the entire lung. The application of new techniques in surgery of the chest offered about a 60% chance of saving life in a condition formerly considered invariably fatal.

New techniques in the radiation of cancer tissue included the development of the cyclotron, providing 3,000,000 volts. The General Electric company reported the building of a cyclotron that would produce 200,000,000 volts. Of cancers treated with neutrons produced by the cyclotron some apparently showed improvement in three months, although in 20% of the cases the tumours were not affected. Neutron particles were thought to be more destructive of cancer tissue than equivalent amounts of radioactivity produced by the X-ray.

Attempts to control cancer by long continued refrigeration indicated that freezing inhibits cancer growth but at the same time stops all of the other activities of the body, so that the human being is in a state of hibernation. Continued experimentation with this technique failed to substantiate early evidences of possible value.

An unusual technique for removing superficial cancers

including a method by which zinc chloride, used as a caustic paste for destroying cancer cells, is made the basis of a substance which fixes the cancer in the tissues and then permits surgical destruction of the cancer under the microscope.

The development of radioactive isotopes permitted experimentation with various radioactive substances which, injected into the body, travel to the cancer tissue and carry radioactivity directly to such tissue. Radioactive iodine was used particularly in attacking cancer of the thyroid gland and metastases from such cancers. (See also CANCER.)

Glands.—Various epochs in medicine are related to the lines of interest in specific aspects of medical study or specific systems and functions of the human body. The glandular period probably received its maximum impulse with the discovery of insulin by Banting and its use in overcoming diabetes. Previously, adrenalin from the adrenal glands and thyroxin from the thyroid gland had been isolated. These measures opened up a new series of studies leading to the use of liver extract against pernicious anaemia. Once the glandular epoch began to develop, new experiments were made relative to the isolation of a half dozen or more hormones from the pituitary gland, a whole range of hormones from the ovary and testis and a number of hormones from the wall of the stomach, from the kidney, from the heart and the liver.

Interesting experiments have been mentioned involving the injection of the male sex hormone into women to control cancer and of the female sex hormone into men for the same purpose. The use of the male sex hormone in a nursing mother will stop the flow of milk. Among other discoveries in relation to the female sex hormone was the way in which it can work together with insulin to keep down blood sugar in diabetes. Particularly important was the use of both male and female sex hormones in the period called the climacteric, when the sex glands begin to cease their active life and to atrophy.

An extract from the adrenal gland cortex, known as cortin, was found to be useful in treatment of various deficiencies related to that gland. A substitute for the adrenal gland hormone prepared synthetically and known as desoxycorticosterone was found to have special value in shock and also in the treatment of various conditions in which muscular weakness was a prominent symptom.

Significant also were researches which determined the presence in the kidney of a substance called renin, which reacts with a substance from the blood known as angiotonin to raise the blood pressure. Several hormones alleged to have influence in lowering the blood pressure were under investigation. These experiments derived from the work of Harry Goldblatt, who tied off the circulation of blood to the kidney and thus showed that some substance retained from the kidney in the body was related in some instances to the presence of high blood pressure.

The ovaries produce internal secretions necessary for the proper functioning of the uterus both in the normal life of the woman and in relation to childbirth. Internal secretions from the ovary determine cyclic changes in the vagina and in the cervix and are also related to the growth of the mammary glands. The ovary also gives off hormones, which in turn regulate the development of hormones by the pituitary gland, and there is a close interrelation between these glands. The anterior pituitary gland gives off a hormone which induces growth of the graafian follicles of the ovary. These follicles secrete the oestrogenic hormone, which brings about the changes that take place in the vagina and uterus during menstruation. Research by

chemists and physiologists yielded much new information regarding the oestrogenic hormones. The oestrogenic substance is produced in large amounts during pregnancy. Alpha oestradiol is considered the most potent of all the known oestrogens. These substances are given by injection, in ointments and by mouth and for a variety of conditions. The oestrogens are carcinogenic when given experimentally to animals which have an inherited sensitivity to the development of cancer of the breast. The corpus luteum, which occurs in the ovary after growth and elimination of the egg cell, has a hormone which stimulates growth of the breasts and relaxes the muscle of the uterus. This is known as progesterone. One of its uses is for the prevention of habitual abortion. Oestrogenic substances are used also for functional bleeding with excessive flow in women. (See also ENDOCRINOLOGY.)

Otolaryngology.—Conspicuous among the developments in the field of otolaryngology during the decade was the announcement of an operation known as the fenestration operation for otosclerosis or progressive loss of hearing. The procedure, known for some years, had always failed until Dr. Julius Lempert of New York City devised new instruments and new improvements in technique. By 1946 many thousands of operations had been performed in the United States, and great numbers of people previously condemned to permanent loss of hearing had recovered all or considerable portions of their ability to hear at various levels.

Continued research into the cause and pathology of otosclerosis led to studies along the lines of improved nutrition to overcome deficiencies in the field of the proteins and vitamins, particularly with an indication that detection of such deficiencies early in the course of loss of hearing might be helpful in arresting the progress.

Outstanding also in this field was the development of hearing aids to a quantity and quality never before achieved. Estimates indicated from 5,000,000 to 10,000,000 persons in the United States with hearing loss. New hearing devices were developed by the methods of mass production, the prices making them available to persons of moderate means.

Research in U.S. army medical centres involving the rehabilitation of soldiers who lost their hearing due to the noise and concussion of high explosives yielded excellent results brought about by combined psychologic approach with the application of hearing devices and teaching in the methods of the proper use of such devices.

As already mentioned, the operation for mastoiditis became less frequent after the prevention of secondary infection of the mastoid following infection of the nose and throat. The early use of the antibiotic drugs prevented extension of infection from the middle ear to the mastoid. In the same way secondary infection of the large blood vessels in this area was avoided, and in some instances when it did occur, it was controlled by the antibiotic drugs. These secondary infections of the blood vessels close to the brain formerly were invariably fatal.

Plastic operations were developed for the loss of the ear or for portions of the ear, and excellent plastic operations for changing the shape and position of protruding ears became more generally available.

The treatment of infection of the sinuses was advanced through investigations which indicated the great frequency of sensitivities to various substances as one of the major factors in the development of various forms of inflammation and infection of the sinuses. New operative procedures were developed for the drainage of the sinuses. Combined approach to infection by the use of the X-ray,

radium and antibiotic drugs led to the control of many cases of chronic infection and inflammation of the frontal, maxillary and ethmoid sinuses. (See also DEAFNESS.)

Ophthalmology.—Among the most serious of conditions affecting the eyes had been glaucoma, a condition in which there is increased tension in the eyeball caused by failure of proper drainage of fluid from the eye. Several new surgical procedures were developed leading to permanently satisfactory results. A South American investigator developed a technique by which injection of a drug deep into the eyeball yielded lessening of the tension within the eye. Late in 1946 announcement was made of the use of a new drug called di-isopropyl fluorophosphate, with the special quality of lessening the pressure within the eye. If continued experimentation with this drug confirmed its virtues, a tremendous step would have been made for the control of one of the most serious and permanently disabling conditions affecting the eye.

As a result of experiences in World War II, plastic substances were used for the creation of artificial eyes, and extensive improvements were made in the provision of such materials. New operative procedures were developed to permit the tissues to move the eye so that there is co-ordination with the good eye.

Similar improvements were made in the development of contact lenses, which take the place of ordinary spectacles. The improvements in the contact lenses and in the materials used between the lens and the eye in order to prevent irritation resulted in widespread application of these materials to cases of disturbed vision.

New studies were also made relative to a disturbance of vision related to the various planes in which objects appear. The complaint is known as aniseikonia. Recognition of this disturbance of vision as a special form and the provision of proper corrective lenses resulted in controlling a good many cases of unexplained headache as well as various nervous conditions related to disturbances of the vision.

Conspicuous in the attack on diseases of the eye was the application of the antibiotic drugs to the control of trachoma, a form of inflammation of the conjunctiva recognized as caused by a virus. This is one of the few virus conditions that yielded to the antibiotic drugs. Similarly, tuberculosis of the eye was found to yield to streptomycin, and thus another cause of visual difficulties was brought under control.

New operative procedures were developed for detachment of the retina. (See also EYE, DISEASES OF.)

Physical Medicine.—Although such techniques as the use of massage, hot baths, exercise and controlled motion were first described by Hippocrates hundreds of years before the beginning of the Christian era, the decade 1937-46 witnessed a notable revival of such methods and the development of improvements in techniques and materials. The National Foundation for Infantile Paralysis and the Baruch foundation devoted millions of dollars to extension of education in physical medicine and to the training of technicians. The claims made by Sister Elizabeth Kenny relative to the value of hot packs and muscle re-education in the treatment of infantile paralysis served as a stimulus to further studies. Extension of the field of physical medicine resulted also from its widespread use in aiding the rehabilitation of men wounded in World War II. Thus soldiers who had suffered injuries to the spinal cord with paralysis of the limbs were brought to maximum physical restoration by the application of physical medicine, by the

First sale of radioactive isotopes for use in medical research took place at Oak Ridge, Tenn., when Dr. E. V. Cowdry (second left), director of a cancer hospital in St. Louis, Mo., was sold a millicurie of Carbon 14 on Aug. 2, 1946. The isotopes were to be used as tracers in studying living cell reactions

use of prostigmine to lessen spasticity and by the application of nerve-muscle re-education. Similar methods yielded a much higher rate of recovery in patients paralyzed as the result of infantile paralysis or meningitis.

Much interest attached to improvements in apparatus for providing ultraviolet rays, useful not alone in the prevention of rickets and in bringing about suitable mobilization of calcium in the body but also for sterilization of air in schools, hospitals and barracks.

New devices were developed for the application of the fever treatment, and heat cabinets were applied particularly in the control of infections with syphilis and gonorrhoea.

Physical medicine included also extensive improvements in the roentgen ray and in the application of radium and of radioactivity through the radium emanation in the form of radon. New devices such as the cyclotron and the betatron were employed to create radioactive isotopes, and by these techniques radioactivity could be carried into portions of the body not previously approachable by this method.

Improvements in the field of rehabilitation involved the development of special techniques for vocational therapy, occupational therapy and group psychotherapy.

New Techniques.—The progress of medicine is greatly dependent on new discoveries in apparatus and methods which, once conceived, permit great numbers of investigators to search along pathways not previously open.

The perfection of the electron microscope permitted the photographing of infinitesimal bodies like the viruses, and from observations in such photography came the isolation of several viruses not formerly known. Accurate observations also permitted statements as to the sizes and shapes of viruses and their relationship to each other.

The technique developed by Ernest W. Goodpasture for

the cultivation of viruses, utilizing the fertilized embryo chick, permitted not only the isolation of a number of viruses in pure form but also the preparation of vaccines which could be inoculated and thus cause the human body to develop protective substances against infection with such viruses.

The development of the radioactive isotopes, coupled with the use of the Geiger counter, made possible the tracing of various elements on their paths through the body and by their selective location in specialized tissues the determination as to the existence of metastases from cancers.

The use of electric amplification of sound led to the development of a device for locating portions of steel or missiles or other foreign substances in the tissues of the body and thus saved the lives of many men wounded in war.

The application of the electric eye principle led to the development of a cane to be used by the blind which would indicate to the blinded person carrying the cane the presence at various distances of objects of various sizes.

A combination of a chemical and physical principle led to the development of a light to be placed on the ear of an aviator which would indicate by the intensity of the light the amount of oxygen circulating in the blood and thus permit the giving of oxygen when flying at dangerously high altitudes.

These were but samples of thousands of technical discoveries made in other fields and applied to medicine.

Social Medicine.—Improvements in medical techniques resulted in considerably increasing the costs of high quality

medical service. Medicine, formerly practised by an individual physician with the materials that he could carry in a bag, now required hospitals for the application of new methods involving the use of such devices as the basal metabolic apparatus, the roentgen ray, the electrocardiograph, the electroencephalograph and many other new instruments. By the application of new methods and by early ambulation rather than prolonged bed rest, the relative stay of the patient in the hospital was lessened, but visits to the hospital were far more frequent than formerly.

In order to meet the increasing costs of medical service and to secure better distribution, many nations instituted the system of compulsory insurance against the costs of sickness. This method did not seem to be easily applicable to the U.S. democratic system of government. As a result, the development of voluntary insurance against the costs of hospitalization and of medical care was exceedingly rapid. By the end of 1946, voluntary insurance against the costs of hospitalization had risen in the number of persons insured to more than 30,000,000. Insurance in private insurance companies against the costs of sickness and surgery formerly demanded premium rates so high that it could be carried by only a small percentage of the population. Application of mass sale of insurance against the costs of sickness and surgery and great improvement in medical science which made the accumulation of actuarial records possible resulted in the development of several types of insurance which grew at an exceedingly rapid rate. These included group insurance sold by the private insurance companies, which by 1946 covered in whole or in part the sickness and surgical costs of some 23,000,000 industrial workers. New techniques developed through the county and state medical societies similarly covered, at the end of 1946, some 5,000,000 to 6,000,000 persons.

The representatives of the mine workers were successful in securing an arrangement whereby employers established a health and welfare fund, representing a certain percentage of the cost of each ton of coal, this health and welfare fund being administered by joint committees of the miners, the mine owners and the public and providing free choice of physician and free choice of hospital by the miner and his family.

Toward the end of 1946 the American Federation of Labor announced its desire to establish a similar type of fund for all members of unionized labour embraced in the federation.

The congress of the United States passed legislation for the use of federal funds in the building of hospitals and health centres and toward developing a co-ordinated use of medical facilities. Thus there seemed to be developing in the United States a system for the provision of medical and hospital care which was definitely related to the U.S. democratic system of government. Meighen, Arthur

Meighen (1874–), Canadian politician, was born June 16 at Anderson, Ont. Raised on a farm, he was educated at St. Mary's Collegiate institute, Caledonia, Ont., and at the University of Toronto. After teaching at Collegiate institute and in Winnipeg, he was called to the bar at Winnipeg in 1903. He then practised law at Portage la Prairie, Manitoba. First elected to the Canadian house of commons in 1908, he was re-elected in 1911, 1913 and 1917. He was solicitor general in 1913, secretary of state for Canada from 1915 to 1917 and minister of the interior and superintendent general of Indian affairs in 1917. In 1918 he went to England with the prime minister, Sir Robert Borden, to attend the Imperial conference of that year. Meighen served as premier of Canada from July 1920 to Dec. 1921, and again from July to Sept. 1926, until he was defeated in the general election. In Feb. 1932 he was chosen minister without portfolio in the Bennett cabinet, and was named leader of the senate. Selected to lead the Conservative party in 1941, he lost his seat in the house of commons in Feb. 1942 and resigned as leader of his party the following December.

Melbourne

Capital of the state of Victoria, Australia, Melbourne had in 1946 an estimated population of 1,184,000 (greater Melbourne area). During 1937-46 its civil activities expanded considerably. In 1939 the Melbourne city council, a corporation with an annual revenue of £A2,000,000, staged a £12,500 pageant which emphasized national progress, unity and artistic achievement. After World War II civic projects were revived and enlarged. The council and the Victorian state government advanced proposals for the construction of an eight-acre cultural centre in the heart of the city, to house a national art gallery, music hall and auditorium, at an estimated cost of £2,000,000. A scheme for a permanent state orchestra and an annual music festival and carnival were proposed. More attention was given to Melbourne's celebrated parks, gardens, reserves and sports fields (total area 1,626 ac.). Maintenance charges rose from £78,000 in 1937 to £117,000 in 1946.

Early in the Pacific war the commander in chief, Southwest Pacific, General Douglas MacArthur, had his first headquarters in Melbourne, where large numbers of U.S. service personnel were based. Later, Admiral Sir Bruce (afterward Baron) Fraser, commander in chief of the British fleet in the area, established an administrative staff in Melbourne. Victoria barracks (defense headquarters), Melbourne, it was announced, might become one of the most important defense centres in the British commonwealth. Established there in 1946 was a British-Australian-New

128 Zealand-Indian defense team of the highest rank called "joint chiefs of staff in Australia." (A. R. MN.)

Memel Territory

Memel (Lithuanian Klaipeda) became provisionally a part of the soviet union in 1945. It is a long strip of land on the right bank of the Niemen (Nemunas) river on the frontier of East Prussia and Lithuania. Area, 1,100 sq.mi.; pop. (official estimate of 1939), 155,000. According to the German census of 1910 this region had a population of 140,766, of whom 71,191 spoke German as their mother tongue, 67,345 Lithuanian and 1,970 were bilingual. The Germans greatly predominated in the town and port of Memel (an old Hanseatic trading settlement); the Lithuanians predominated in the rural districts. Memel, the chief town, with modern wharves and ice-free throughout the year, is the main port of Lithuania and important also for the export of Polish produce.

Memel Territory, formerly a part of Germany, was ceded by the Versailles treaty to the four principal Allied powers who intended to establish an international administration. In Jan. 1923, local patriots and irregular Lithuanians seized it from the hands of the French administrator, and in 1924 the powers agreed it should be part of Lithuania with large autonomy and subject to certain conditions to regulate the use of the port by both Lithuania and Poland. According to the terms of a convention worked out by a commission with a U.S. head, Norman H. Davis, Memel Territory was to have a governor appointed by Lithuania; an elected chamber of representatives (*Landtag*) of 29 members and a directorate of five, the president of the directorate being appointed by the governor, and the other four directors appointed by the president. Unfortunately, racial hatred between German Memellanders and Lithuanians prevented the smooth working of these arrangements. At first Lithuanians dismissed German workers, expropriated their land and tried many for treason. The national socialists turned the tables in 1938 by winning 25 of the 29 seats in the diet. On March 22, 1939, Germany demanded that the territory be annexed to the German reich, and the next day Adolf Hitler landed from a battleship to take possession and began erecting fortifications. Russian armies occupied the territory early in 1945 and deported most of the German population to Russia for forced labour or to Germany. By the Berlin conference of July 1945, it was agreed that the soviet union should administer provisionally the territory until the boundaries of Germany were finally settled. (S. B. F.)

Menzies, Robert Gordon

Menzies (1894–), Australian statesman, born Dec. 20, 1894, was educated at Grenville college, Ballarat, at Wesley college, Melbourne and at Melbourne university. He practised law in Victoria, entering the Victorian legislative council in 1928 and the provincial assembly the following year. From 1932 to 1934 he was attorney-general and minister for railways in the cabinet of Victorian premier Sir Stanley Argyle, and for a short time in 1934 was acting premier. In that year he was appointed attorney-general and minister for industry in the dominion cabinet of Joseph A. Lyons. Upon the death of Lyons in 1939, Menzies was elected leader of the United Australia party, and received his commission to form a cabinet. Immediately upon the outbreak of World War II on Sept. 3, 1939, Menzies' cabinet approved a declaration of war against Germany. The following month he re-introduced compulsory military training in Australia. In March 1940 he reformed his cabinet along coalition lines to include three members of the Country party. Menzies left Australia in Jan. 1941 to attend a series of conferences with Winston Churchill and members of the war cabinet on Australia's part in the war. He returned to Melbourne late in May to face a growing opposition in parliament, caused partly by the Libyan, Greek and Cretan defeats in which Australian troops had taken part, and partly by the Labour party's insistence that the prime minister remain in Australia and not return to London. Menzies resigned in Aug. 1941 and was succeeded by Arthur Fadden, in whose cabinet he remained as minister of defense co-ordination. He was again elected leader of the United Australia party in Sept. 1943.

Mercury

With a total world production of only 5,000 short tons a year prior to World War II, doubling during the war years, mercury had acquired a multiplicity of uses which gave it an importance far out of proportion to its bulk.

The problem of mercury supply during the war years was complicated on the one hand by the magnitude of the essential war uses, and on the other hand by the fact that normally two-thirds of the output had come from Italy and Spain.

Table I.—World Production of Mercury
(Short Tons)

	1937	1938	1939	1940	1941	1942	1943	1944	1945
Canada	—	—	—	77	268	518	845	368	—
Chile	—	2	—	—	50	86	97	45	?
China	66	21	187	129	248	180	130	114	?
Czechoslovakia	105	110	101	98	—	—	—	—	—
Germany	68	53	46	36	34	19	—	—	—
Italy	2,545	2,537	2,552	3,467	3,578	2,884	2,280	1,330	1,520
Mexico	188	324	280	443	879	1,233	1,076	989	625
South Africa	—	—	—	—	8	22	45	45	32
Spain	1,078	1,574	1,365	1,984	3,286	2,747	1,815	2,620	1,523
United States	627	684	708	1,436	1,707	1,932	1,973	1,432	1,169
Total	5,059	5,700	5,510	7,980	10,450	9,880	8,740	7,220	5,130

Normally, the United States had been a relatively small producer of mercury. In spite of the handicap of low-grade ores, the domestic mercury industry was expanded to meet war demands, leaving such imports as could be secured, chiefly from Canada and Mexico, to be accumulated as stocks to cover a possible emergency shortage. Between 1937 and 1943 the domestic mercury output in-

creased more than threefold. Production declined heavily after the main peak of demand had been passed in 1943, but in 1945 it was still almost double the 1937 figure.

Direct war uses for mercury included such items as fulminate for explosives, anti-fouling paint for naval use and pharmaceuticals for the armed forces; items contributing indirectly to the war program were agricultural disinfectants and fungicides, the mercury used indirectly in various processes for producing chlorine, caustic soda, acetic acid and other chemicals and the large amounts used in electrical apparatus and industrial control instruments. The large increase in mercury consumption in 1945 was largely because of the development of a new type of dry cell using mercury as an active ingredient, large numbers of which were required for tropical use by the armed forces.

After the close of World War II this new cell was adapted for certain civilian uses.

Table II.—Data on the Mercury Industry in the United States
(Thousands of pounds)

	1937	1938	1939	1940	1941	1942	1943	1944	1945
Production	1,255	1,366	1,416	2,871	3,414	3,864	3,947	2,864	2,338
Imports	1,438	180	266	13	588	2,960	3,633	1,486	5,215
Spain	535	95	198	3	8	—	—	—	4,210
Italy	747	84	26	—	—	—	—	—	—
Mexico	117	—	43	10	521	2,289	2,239	1,289	825
Canada	—	—	—	—	60	562	1,184	119	131
Exports	35	54	92	731	197	593	1,158	57	208
Available supply .	2,658	1,491	1,590	2,153	3,805	6,231	6,429	4,294	7,345
Consumption . . .	—	—	—	2,037	3,405	3,777	4,142	3,260	4,856

In response to war demand mercury production was developed in British Columbia, and in 1943 Canada was the world's fifth largest producer. With the cessation of war demand operations were suspended, pending the disposal of accumulated stocks.

The normally small output of Mexico was expanded more than tenfold, and during 1942–44 Mexico was the largest source of supply for U.S. imports. (G. A. Ro.)

Meretskov, Kirill Afanasjevich

Meretskov (? —), Russian army officer, was in command of the Leningrad military district at the outbreak of the Russo-Finnish war in Nov. 1939, and was in part responsible for successful operations against the Finns. After the Germans attacked the Soviet Union in June 1941, Meretskov was charged with maintaining the defenses outside the Leningrad area, and in Jan. 1943, together with Marshal Leonid Govorov, he lifted the land blockade of Leningrad. In the early winter campaign of 1943–44, Meretskov's forces on the Volkhov front participated in the Russian operation which crushed Wehrmacht defenses about Leningrad and captured Novgorod to the south. In the summer campaign of 1944, Meretskov was assigned to the Karelian front; again with Marshal Govorov he launched the drive on June 10 that smashed through the Finnish defenses and compelled Finland to sue for peace. Meretskov was awarded the Order of Suvorov in 1944, and in October he was elevated to the rank of marshal. In Aug. 1945, when the Soviet Union sent three of its finest armies into Manchuria, Meretskov commanded the 1st far eastern army.

Merrill, Frank Dow

Merrill (1903–), U.S. army officer, was born Dec. 4, 1903, in Woodville, Mass. He was graduated from West Point in 1929, and was then assigned to study at the Massachusetts Institute of Technology, where he received

his B.S. degree in 1932. After a period as an instructor at Fort Riley cavalry school in 1935, he was sent to Japan in 1937. He was in Rangoon on a mission for Gen. Douglas MacArthur when war broke out on Dec. 7, 1941. He stayed on in Burma with Gen. Joseph W. Stilwell and participated in the retreat to India. In 1942 and 1943 Merrill helped Stilwell map plans for the reconquest of Burma. In early 1944 Merrill, then a brigadier general, was given command of specially trained jungle troops, later called "Merrill's Marauders." These forces showed remarkable adaptability to jungle warfare and defeated the Japanese at Shaduzup and at Myitkyina in Burma. Merrill took ill during the campaign in April 1944 and was flown back to a hospital in India for treatment. In Aug. 1944 he was relieved of his command. From Dec. 1944 to July 1945 Maj. Gen. Merrill acted as deputy commander of U.S. forces in the India-Burma theatre of operations, and in Jan. 1946 he was assigned to the western defense command under Gen. Stilwell.

Metallurgy

During World War II, emphasis in metallurgy was on production rather than on methods, and new developments in metallurgical procedure generally were not attempted unless they promised to lead to the solution of a vexing production problem. Hence, many of the advances accomplished were concerned with matters that for security reasons could not be made public at the time. With the war over and the veil of secrecy lifted, many new and striking developments in metallurgical detail, but relatively little about changes in fundamental process metallurgy, were revealed.

Although many of the new processes and products were to be adapted to peacetime industry, others would disappear, having been useful only for the time or need for which they were devised. The same comment applied to many types of new equipment; some could be used directly; others could be adapted to similar peacetime uses; but some were of about as much use as a worn-out obsolete bomber—not because of any lack for which they were designed, but because that use no longer existed.

Investigators sent into axis countries after the close of the war reported their findings with respect to metallurgical developments during the war years.

While some of the methods reported could be adapted for use in peacetime industry, much of the work done was concerned with the best utilization of low-grade materials or substitutes, made necessary by the shortage of raw materials.

Developments worthy of mention were so numerous that it was difficult to catalogue them, let alone discuss them, however briefly.

Aluminum.—Increased war demand brought no significant changes in the basic metallurgy of aluminum, but many new alloys were developed, and war uses led to new applications of the metal.

Considerable advance was made, however, in the development of processes for utilizing low-grade ores for the preparation of the pure alumina required for the production of the metal.

Antimony.—Expansion in smelting capacity led to several new types of plant operation: a process for the recovery of antimony and mercury from livingstonite; a process involv-

ing electric furnace treatment of the ore; and a process of leaching and electrolytic recovery. The addition of antimony to 18-8 and plain chromium stainless steels was reported to reduce corrosion by hydrochloric, sulphuric and acetic acids.

Beryllium.—Most of the development of commercial uses of beryllium alloys came during the decade 1937-46, with progress greatly accelerated by war uses, especially in aeroplane engine and instrument parts. The metal was also mentioned in connection with work on the atomic bomb, but to what extent and for what purpose was not reported.

Bismuth.—The most important change in the applications of bismuth was increased use in low melting point alloys, as aids in the forming and shaping of metals. Addition of small quantities of bismuth to aluminum alloys and to stainless, manganese and carbon steels improves machinability.

Boron.—As an addition in low alloy steels, small percentages of boron impart physical properties, especially hardness, that would require much greater amounts of other metals; in aluminum permanent mould castings, boron refines the grain structure and produces round cavities instead of angular ones, without affecting corrosion characteristics or heat treatment, but at the expense of greater brittleness and some lowering of physical properties.

Cadmium.—The outstanding feature in connection with cadmium was its use to control the rate of action in the pile for the conversion of uranium to plutonium.

Chromium.—Marked studies were made in the development of new chromium alloys resistant to oxidation and corrosion at high temperatures, for use in the jet-driven aeroplane and gas turbine. The formation of a corrosion resistant surface on ordinary steel by heating for an extended time in contact with chromium powder served to conserve high chromium stainless steels in uses where only surface resistance was required.

Cobalt.—The loss of the Belgian plant with the German occupation led to the establishment of smelting facilities at Niagara Falls, U.S., for treatment of the Belgian Congo ores along with those from Canada.

Columbium.—Improved processes were developed for the production of metallic columbium, but few uses had been found for the metal by the end of the decade.

Copper.—No striking advancements were made in copper metallurgy, but many improvements were recorded in plant procedure, life and capacity of equipment, and in the development of new products.

Gold and Silver.—Metallurgical progress in the United States was throttled by the closing of the mines during the war years, but some advances were made in applications. Thousands of tons of silver were loaned by the U.S. treasury, for use in conductor bars in electrolytic aluminum and magnesium plants, to conserve copper. Industrial uses expanded greatly, especially for silver.

Iron and Steel.—New blast furnace construction for war needs did not involve any striking new advances in metallurgy, but they did emphasize the trend toward increased size and capacity; several had a rated capacity of 1,200 tons per day, and some produced at more than rated capacity.

In bessemer steel, the outstanding development of the decade was the use of the photoelectric cell to give precise control of the blowing of the bessemer converter by following the condition of the flame; this procedure resulted in a more uniform product and advanced previous

knowledge of the oxidation process and of the absorption of nitrogen by the bath.

Large quantities of brass were saved by the development of a steel cartridge case for artillery ammunition. After the original development in the United States, the steel case was adopted by Great Britain; Germany also used steel cases.

When the growing demand for alloy steels strained the supply of alloying metals, a series of low alloy compositions, known as national emergency steels, was devised and the substitution of these steels for high-alloy steels in all possible uses conserved large amounts of alloy elements.

Strenuous efforts were made to establish the production of sponge iron on a commercial basis but with little success beyond demonstrating that none of the processes tried could be profitably used except for very limited applications.

It was almost inevitable that the heavy production demands incident to World War II should bring a revival of interest in the use of dry blast as a measure for improving efficiency in blast furnaces, cupolas and bessemer converters. Experimental runs were made in blast furnaces in Germany, using enriched blast containing 26% oxygen, with an appreciable saving in costs, especially with low grade ores. Furnace output was increased and coke consumption was reduced.

A scheme for the classification and identification of inclusions in cast iron and steel was reported to the British Iron and Steel institute.

Lead.—In Canada and Australia, advances were made in blast furnace operation, particularly in the widening of the furnace. Changes were also made in bosh design, including a double set of tuyeres. One interesting new feature resulted directly from manpower shortage; lead pigs piled in cars for interplant movement usually were shifted so much that repiling was necessary before the usual forked truck could be used for unloading; the new procedure was to cast the metal in ten-ton blocks, for handling by crane.

In World War II, lead furnished more than ammunition. Storage batteries for submarines and mechanized land equipment were a major item. An almost fantastic procedure was the laying of an armoured lead pipe under the English channel, through which the gasoline supply for the invasion of Europe was pumped from Britain to the Normandy beach. Also the gasoline itself had been treated with lead tetraethyl to improve its performance in plane and truck engines. Lead protective shields played a significant part in handling the radioactive materials going into the construction of the atomic bomb.

Mercury.—A striking feature in the war uses of mercury was the development of a dry battery using mercury as an active ingredient, giving a cell with long shelf life in tropical temperatures. The new cell was adapted for use in hearing aids, and other applications were expected.

Magnesium.—The war expansion in the production of magnesium brought several new reduction processes to supplement the electrolytic method which had supplied the prewar output. Raw materials used were expanded even more broadly, to include magnesite, dolomite, bruceite, dry lake brines, sea water bitterns and raw sea water, in addition to magnesium chloride from well brines, the only prewar source. An improved process electroplated silver on magnesium as a protection against atmospheric corrosion.

Manganese.—Early in the decade 1937-46, the electrolytic production of manganese passed from the laboratory to the plant stage and by 1945 had expanded to an output

of the order of 2,000 tons a year, with two commercial plants operating, besides the large experimental plant of the U.S. bureau of mines. High cost still limited the use of electrolytic manganese to alloys in which low carbon content bars the use of ferromanganese.

Sodium.—Metallic sodium was used as a coolant for the valve stems of aeroplane engines, the metal being placed in a hollow stem, so that when melted by the heat, it could by convection and conduction carry the heat away from the head of the valve to the base of the stem, where it could be absorbed in the cooling jacket.

Tin.—Loss of smelting capacity in countries falling into axis hands, and transportation difficulties, necessitated the construction of a tin smelter in the United States, near Galveston, Tex. The substitution of electroplating for hot dipping in the production of tin plate resulted in a saving of from one-half to three-quarters of the tin formerly used for cans. Extensions in the facilities for detinning and recovery of tin from scrap and tin cans included the construction of plant capacity to handle 60,000 tons a year, recovering 1,970 lb. of scrap steel and 23 lb. of tin per ton. However, possible recoveries by detinning were reduced to a fraction of their prewar level, since a large proportion of the use of tin cans was already shifted to glass or other types of container, and a large share of the tin containers that were still considered essential were to be used in lend-lease shipments or sent to the U.S. armies abroad, with no recovery possible except for the small share left for use at home.

Titanium.—Most of the increased demand for titanium was for use in paint pigments, and not for metallurgical use. Processes for the production of metallic titanium of high purity were sufficiently successful to make promising the possibility of developing new uses for the metal.

Tungsten.—Demands for tungsten that greatly exceeded the supply led to the substitution of other materials, especially in the major use as high speed tool steel. The two chief measures were the use of molybdenum to replace part of the usual tungsten content, and use of sintered carbides of tungsten and tantalum.

Uranium and Plutonium.—By far the most outstanding metallurgical development of the entire World War II period resulted from the research leading to the production of the atomic bomb (*q.v.*). Scientists not only fulfilled the alchemist's dream of the transmutation of the metals, but went even a step farther and produced a new variety of uranium (U_{239}) and the entirely new metal plutonium—not in amounts requiring the microscope and spectroscope to detect them, but certainly in pounds, and possibly even in hundredweights. This accomplishment opened up such enormous future possibilities that in it on the one hand lay the seeds for the destruction of world civilization, and possibly even of the entire human race and the world itself, or on the other hand, the necessary impetus to bring nations into a sufficient degree of accord that they could dispense with war, while at the same time reaping a harvest of untold benefits from a force created primarily for destruction.

Vanadium.—Long used as a constituent in high strength alloy steels, vanadium entered the field of magnet steels, during World War II, in an alloy with iron and cobalt. It was reported that the Germans used vanadium as a substitute for tungsten in tool steel, and vanadium carbide to supplement tungsten carbide; vanadium was also used in high temperature alloys for jet propulsion engines and gas turbines.

Zinc.—The chief features in the metallurgy of zinc were increased output and recovery from retort smelting, largely

through attention to the character and sizing of the charge; further increase in purity of the product by electrolytic producers; progress in the improvement of the output and efficiency of vertical retorts; continued increase in popularity of the Waelz process; and extensions of plants for the electrogalvanizing of wire and sheets. The Republic Steel Company started electrogalvanizing operations on a large scale near Chicago producing zinc-coated strip in coils with a heavy plating sufficiently ductile to withstand fabricating operations.

Casting Methods.—An innovation in nonferrous technology was the substitution of rolling by a process of continuous casting, in which liquid metal is converted into unlimited lengths of rod or other shape of constant cross section. The method was particularly applicable to brass, copper, aluminum and magnesium, and was used to a limited extent with steel. The same procedure was applied to sheet and strip, but only to a minor degree by the end of the decade.

Where the number of pieces did not require conventional methods of forging, stamping and machining, investment or "lost wax" casting was applied for precision castings in limited numbers. The use of polystyrene and other styrol resins in the lost wax process was said to produce tolerances as low as 0.0002 in. Precision casting methods resulted in savings of metal, time, tooling costs, machining time and man-hours.

Die-casting machines grew in size and weight, and were being made with interchangeable pots and plungers, so that the machine might be adaptable to more than one type of alloy.

Metal Working.—Probably the greatest technological advances in the entire field of metallurgy were to be found in metal working, where not only the skilled efforts of engineers but also the native ingenuity of the workers on the production line combined to produce almost unbelievable savings in working time in a wide variety of mechanical operations. Methods were devised for precision forging of automotive gears, saving the time formerly required for machining. Machining operations, in general, were speeded up, with special attention given to the construction of combination machines which could perform a whole series of operations, applying the principles of the automatic screw machine to a highly complicated succession of different operations, such as the conversion of a rough casting into a finished aeroplane engine cylinder. The production of bombs was greatly improved by the use of spinning methods in forming the nose and tail parts.

Localized Hardening.—There were marked improvements in the methods of producing localized hardening—in particular areas of a part, or restricted to its surface—by the application of localized heating, either by flames directed on the area to be hardened or by the use of induction heating. The latter was particularly effective in generating the required temperature in the desired area before it could be spread to adjacent areas by conduction. High frequency induction heating also provided concentration of heat in a specific area for soldering and brazing. There was a marked lightening of the load in the regular heat treatment furnaces of plants using localized hardening.

Metal Cutting.—Diamond metal-cutting tools were made with three to seven cutting edges side by side around the contour of the tool, so that when one edge is worn dull, the next one can be brought into line with a minimum loss of time. Conventional methods for the flame cutting

of steel gave poor results with stainless steel, because of the high melting point of the chromium oxide formed. A novel method of overcoming this difficulty lay in feeding into the cutting flame a finely divided flux, which combines with the oxide and reduces its melting point. Another new application of flame cutting was in the cutting away of surface flaws in ingots or blooms, replacing the much slower chipping tool; carrying this procedure a step further, the old established methods of flame cutting were adapted to shape a rough form from a steel bloom, to replace a casting.

Welding.—Methods were developed, perfected and extended to new applications and metals. The construction of a welded all-magnesium aeroplane became possible, using sheets, extruded shapes and castings, and a modified arc welding process similar to the atomic hydrogen process, but using helium instead of hydrogen. Another development was the "stitching" of stainless steel sheets by special resistance welding machines. A new system of welding was introduced in which the usual welding rod was replaced by powdered metal and flux, fed into the flame through the tip of the torch.

Powder Metallurgy.—Starting with the consolidation of a metal powder by pressure and heat, there developed a well-established and rapidly-growing practice of powder metallurgy that had extended to the synthesis of a wide variety of ferrous and nonferrous products, had increased in size and complexity of form, and had expanded in range of composition and scope of application as the technique of production had progressed, until the new applications were relieving the load on the die-casting industry. At the same time they were expected to play a part in the solution of many problems involving compounding as well as forming, as applied to war production. Metal parts for many types of equipment for the armed forces were produced by powder metallurgy methods, with great savings in time, material and cost. One small part required by the navy was stamped out at the rate of 520 per min., while the time required for a more complicated piece was cut from 98 min. by conventional forming methods to a matter of seconds, using powder metallurgy. German metallurgists were reported to have perfected a method of producing high grade iron powder directly from liquid metal. Thousands of tons of the product were used in shell bands, with an increase of 20% in the life of the gun barrels, as compared with copper bands.

Metal Finishing.—Much difficulty had been encountered in the dipping or spraying of metal parts with heavy enamels and lacquers, caused by irregularity from flow of excess coating, necessitating discards or extra labour to remove the surplus; also much of the sprayed material was lost, as it could not be concentrated on the part. These troubles were overcome by spraying in an electrostatic field with the part grounded, which concentrated the spray in a thin uniform coating with little loss of the enamel, and with a considerable saving of time, both in application and in reworking faulty pieces. In some cases the speed was doubled, and the cost was reduced in the same proportion.

The use of radio-generated heating to fuse the tin coating of electrolytic tin plate resulted in great improvement in the product, and the ability to produce a thinner coating that was still impervious enough to serve the purpose. Electrolytic tin plate required only about half the amount of tin needed for the old style dipped plate.

An English process was developed for the coating of cast

iron with tin by a hot dipping procedure, giving a good bond and satisfactory smoothness and gloss.

Miscellaneous Features.—There were several new and interesting applications for low temperatures in the treatment of metals. Temperatures down to -100° F. were used for such processes as retarding the hardening of aluminum alloy rivets; relieving strains and stabilizing the structure of steels to obviate slow changes in dimensions (particularly important in gauges); forcing the completion of transition reactions not fully stabilized in the original treatment, to give increased hardness and life in machine tools; in making shrink fits of closefitting machine parts. For these applications mechanical refrigeration replaced cruder and more expensive methods using dry ice and liquid air.

The usual reasons for the use of air conditioning (*q.v.*) in industrial work continued to be improvement of working conditions or the stabilization of atmospheric conditions; the former to increase output and the latter to ensure uniformity of output. It was found to be advantageous to install air conditioning in plants producing certain highly finished metal parts, in order to avoid future corrosion from traces of perspiration left on the surface during handling. It was also used to eliminate minute differences in the size of machine parts caused by temperature changes; in some cases size tolerances were so narrow as to be disturbed by ordinary day and night changes of temperature in the shop.

One of the most interesting of the new metallurgical developments was the use in aircraft construction of a rivet with a hollow end, in which was embedded a small charge of explosive. These were used at points where the under side of the work was inaccessible for heading in the usual way. When the explosive was set off by heating the rivet head, the end was expanded and the rivet was set in place.

The familiar bimetallic disk used for many years as a control in electrical heating equipment was adapted for fire protection devices in war planes.

Inspection Methods.—One of the crucial problems in maintaining high speed production methods was that of speeding up the inspection procedure to keep pace with production. This difficulty was more pronounced in inspection for flaws than for proper dimensioning.

The X-ray, radiography, fluorescent light, ultrasonics, the electron microscope, and magnetic and photoelastic methods, and measurement of hardenability and machinability were among the newer testing processes which were finding new fields of use and broader application.

Methods were developed for detecting cracks, pores and other flaws, connecting with the surface; after rubbing the surface with a phosphor paste, and wiping the surplus from the surface, the flaws showed up by fluorescence under an ultraviolet light.

Inspection for internal flaws by X-ray (*q.v.*) was speeded up and put on a production line basis. In some cases photographic record was made of each piece, while in others only visual examination was made, viewing an image thrown on a fluorescent screen. One line of this kind produced a photographic record of six castings every 30 seconds, or at the rate of 17,000 per day. The scope of X-ray radiography was extended to 12 in. of metal by the use of a new 2,000,000 volt X-ray machine. X-ray diffraction methods were successfully applied in the nondestructive testing of the bond between an electrodeposited metal and the base metal, the investigation of electrodeposited alloys, and in studying the diffusion of indium plating into lead in aircraft bearings.

X-rays were used in a nondestructible gauging of the

thickness of metal parts not accessible for ordinary procedures, by comparing the density of a negative made under standard exposure with others from metal of known thickness. X-ray methods were also developed for the inspection of the setting of diamonds in tools, to guard against loss of diamonds, while another application measured the thickness of a sheet or plate of metal by the reflection of the rays from the back of the sheet.

Advances were likewise made in the application of radiography, since radium can be used with much less elaborate equipment than is required for X-rays.

On the market as early as 1941 were generators of ultrasonic waves, and several new applications were being tried out in the testing of metals for flaws, cracks, inclusions and voids. In addition to test procedures, another development that showed promise was the better dispersion of liquid alloys and of metal powders, and there were indications that these waves might help in the degasifying of metals and in the penetration of the hardening agent in surface hardening processes.

Although the entire commercial development of the electron microscope fell within the decade 1937-46, this instrument responded to the same conditions that brought about such extensive improvements in older types of equipment and processes, and radical advances have been made in its applications, as well as in the simplification of equipment. At the same time, the magnifying power and resolution were greatly increased.

By the substitution of high, intermediate and low-toned sound signals for the usual visual gauge indications for oversize, good and undersize readings, it was possible to utilize blind operators for delicate gauging operations.

Substitutes.—Scarcity of so many metals commonly available in plentiful amounts led to an extended application of substitutes, to save materials short in supply; for example, the use of steel in cartridge cases, and the use of steel in tanks to save one-third that much aluminum in parts formerly made of that metal. A saving of 80% in the requirements of copper for bullet jackets resulted from the use of steel plate clad with copper or gilding metal.

A different type of substitution came into play when it was necessary to use steel rolling facilities to supplement a shortage of capacity for rolling brass for cartridge cases. The chief difficulty to overcome was in controlling the grain size.

Lead-base die castings were extensively substituted for brass, aluminum and zinc-base castings. It appeared that lead-base bearing metals might also be used to replace similar alloys containing tin.

Plastic printing plates were developed to take the place of aluminum and zinc needed for other uses. A feature item in the development of the use of plastics (*q.v.*) as a substitute for metals was a plastic rivet that could be expanded in place by compressed air, the principle being similar to that used in the previously developed explosive rivet. A unique feature of the application was that once the rivet had been put in place, after warming to soften it, and had been expanded by air pressure, it could readily be removed if and when desired, by a second application of heat which caused the plastic to return to its original size and shape.

This novel property, known as "plastic memory," was expected to find many uses. (See also *INDUSTRIAL RESEARCH* and articles on individual metals.) (G. A. Ro.)

Metaxas, John

Metaxas (1871-1941), Greek statesman and soldier, was born April 12, 1871, on the island of Ithaca. He attended military schools in Greece and Germany and served in both the Graeco-Turkish War of 1897 and the Balkan Wars, 1912-13. His ability in directing field operations in the latter conflict earned him the post of chief of general staff in 1915, and he became King Constantine's closest military adviser during World War I. Twice exiled from Greece, once for plotting an unsuccessful monarchist revolt, Metaxas returned to his country's good graces and in 1926 was given the post of minister of communications in the newly created Greek republic. He was appointed minister of state in 1935 and a year later became premier. Once established in the premiership, Metaxas showed his scorn for democratic procedure. One of his first acts was to abolish parliament and all political parties; he declared martial law to quell a general strike, and with the consent of King George II proclaimed himself chief of state and ruled Greece with an iron hand. He also took over the portfolios of war, navy, air, foreign affairs and cults and national education. Metaxas again displayed keen military judgment when Italian armies attacked Greece in Oct. 1940, and he was credited with the Greek successes against the invaders in the ensuing campaigns in Albania. He died at his suburban home near Athens, Jan. 29, 1941, some two months before Greece's invasion by German forces.

Meteorology

During the eventful decade 1937-46, meteorology outgrew its earth-bound techniques and its dependence upon surface weather observations for indirect analysis of the ever changing state of the upper air and became the direct three-dimensional science of the entire atmosphere that nature destined it to be. Progress during these years was only a beginning, but it was most important. The air near the ground is not unimportant in the make-up of weather, but the almost limitless expanse of upper air and the interactions between vast chunks of the atmosphere which meteorologists call air masses are the principal determinants of weather and climate. The troposphere or lower portion of the atmosphere comprises a varying number of more or less distinct air masses, each comparatively homogeneous, level for level, within itself and each covering millions of square miles and extending from the ground several miles upward. When a distinctive air mass drifts away from its source region or gradually loses its identity, and a different air mass engulfs the land and sea, a change in weather occurs; and when contiguous air masses have very different characteristics in temperature and humidity the zone of conflict along their boundaries is usually the scene of rain, showers or other forms of stormy weather.

Meteorologists knew long before 1937 that many of the secrets of weather and climate were hidden in the upper air, but they had no practical means for making regular daily observations or measurements of the elements far above the ground and consequently no direct means of analyzing the ultimate causes of the changing weather. Scattered observations had been obtained by use of large kites or by balloons and aeroplanes, but these had given only a fragmentary sampling of the state of the atmosphere as a whole and its endless changes, and were a very inade-

Weather detector developed during World War II to forecast wind direction at varying levels, thus enabling planes to fly at greatest speed with minimum fuel consumption

quate basis for computing their causes and effects. After many years of experimentation, automatic instruments were developed for measuring the air pressure, temperature, humidity and other significant weather elements far above the ground. During the late 1930s, radiometeorographs were brought into daily use to obtain records of temperature, pressure and water vapour in the air aloft. The country-wide network of these radiometeorograph stations established in the U.S. in 1938 and 1939 was a major advance toward making meteorology an analytical science. During the years 1940 through 1945, the enormous wartime expansion of this system of upper air sounding stations throughout the world carried the advance much further. The total number in operation at one time probably exceeded 400 at the peak of military expansion.

Wartime Gains.—Although meteorology was not the only science to gain much from wartime intensification of scientific and industrial effort, and although its new and immediate applications were not as spectacular as those in several other fields, it was among the most outstanding in fundamental work preparatory to progress and far-reaching applications. To see the significance of this work it must be remembered that weather and climate are among the most controlling factors of man's environment. In peace they largely determine his food supply, his shelter and consequently his economic and social welfare. In war they sometimes decide the outcome of battle and they almost always enter into the cost and length of the struggle. The meteorologist attempts to describe and forecast the weather

so that man can adjust his plans and activities to fit the weather environment as it comes. Prior to 1940, meteorologists could visualize developments in their science no further than the remote possibilities of a full understanding of the ways of the atmosphere and an improvement in the scope and accuracy of weather forecasting. By 1945, however, there were a few who talked seriously of eventual control of weather on a limited scale, and although meteorologists in general were not ready to accept this vision and its consequent responsibilities, many could not overlook the possible use of newly found sources of energy to modify some aspects of weather and climate under favourable circumstances of topography and air masses.

Not least among the developments favourable for progress in weather science was the great increase in the total number of graduate meteorologists seriously engaged in research and development, especially during World War II. In 1937, probably not more than 2,000 persons in the entire world were working in meteorology at the scientific level, and the number of competent scientists in this field may have been less than 1,000. This did not include weather observers, whose total number in all classes of full and part time workers exclusive of amateurs, was much larger, probably about 50,000 and perhaps 75,000 if all those employed by or officially associated with recognized meteorological institutes and government weather services throughout the world were included. By 1946, not less than 25,000 had been trained at the scientific and professional level, and several times that many were employed as weather observers, technicians and subprofessionals of one capacity or another in meteorology and climatology. Thus meteorological knowledge was much more widely disseminated, and the roster of scientists with training and experience for research and development was much broader and numerically much larger than ever before. For the first time, meteorologists were numerous enough to make their work comparable in volume and importance with that of other major physical sciences.

Besides the radiometeorograph or radiosonde, as it was called in the U.S., for measuring elements above the surface air layers there were several other developments in meteorological apparatus that contributed to the scope and accuracy of weather data. Mensuration is the foundation of the physical sciences. Meteorology could never formulate accurate weather forecasts without exact and comprehensive measurements of significant weather elements, and extension of these forecasts in time range probably would depend on representative measurements throughout the earth's atmosphere. Many of the determinant conditions, for example, convergence, divergence and vertical motion in the air, radiation phenomena, physical and chemical structure of the upper air and energy transformation in the atmosphere were still wholly beyond the scope of the meteorologist's measuring instruments, or practically so. Moreover, weather conditions of crucial importance in air commerce and aircraft industries were causing serious trouble to those rapidly expanding operations, and strong demands arose for accurate measurements, reports and forecasts of these troublesome conditions. In 1937, there was meagre information for the aviator concerning fog, low clouds and other causes of poor visibility near the ground or surface of the sea, and even less knowledge of the conditions contributing to the accumulation of ice on aircraft in clouds and rain. By the close of 1946, noteworthy progress had been made in developing instruments and techniques for measuring and forecasting some of these conditions.

The radiosonde had been developed into the rawinsonde,

giving data for computing the winds above the clouds—information vital to safe navigation of aircraft. Two general designs were put into service, each giving wind data in addition to the pressure, temperature and humidity data given by earlier radiosondes. One design used the principle of the radio compass, the other, radar (*q.v.*). Radar itself had brought meteorological applications of the greatest promise for improvements in short range weather forecasting. Early in the use of radar it was found that rain showers often caused an image on the PPI scope or screen. Before long, radar observations were used for locating and tracking severe thunderstorms so that aircraft pilots and others with work adversely affected by such storms could be forewarned. Thus the radar observations had the effect of increasing the vision of the observer from the few miles within range of the naked eye to 100 mi. or more in the cases of thunderstorms. The open spaces or “blind spots” that had existed between the widely separated observation stations were effectively reduced in area and in some instances eliminated. In general, however, this applied only to detection of rain showers and thunderstorms, and only a few regions were covered by these radar installations. In 1944, the first successful photographs of radar views of distant tropical cyclones were made by the U.S. army and navy. One revealed something of the structure of a West Indian hurricane as it crossed the Florida peninsula; the other pictured a typhoon over the western Pacific. These photographs showed not only the central eye of the storm but also the pattern of associated cloud formations and other features not previously identified in tropical cyclones. In 1946, radar equipment was an important part of the instrumentation for a large-scale research project established in Florida to study the origin, development, structure and dissolution of thunderstorms, especially those hazardous to aircraft.

Experiments inaugurated during World War II in Canada, England and the U.S. were being continued in the effort to develop radar equipment of special design that would amplify the salient features of weather as seen in the PPI scope. There were indications that the principles underlying radar, together with developments in other electronics devices, would lead eventually to a new era in meteorological instruments and techniques for measuring atmospheric conditions. In 1946, the number of radar weather stations in the U.S. was being increased and a beginning made toward expansion into a network that would locate and track severe thundersqualls, tornadoes and hurricanes and thus enable meteorologists to give warnings more definite as to time, place and severity than had previously been possible.

Other New Devices.—Another apparatus for finding the approximate location and calculating the movement of remote storms came into greater use between 1939 and 1946. This device, the radiogoniometer for atmospheric or simply the spherics indicator, had a greater radius of observation than radar and sometimes could detect storms at a distance of 1,500 mi. or more. In general, its use was limited to storms that produce lightning or atmospheric since this is the phenomenon which the radiogoniometer detects in this case. Still another device for locating distant storms was developed to the point of limited use in 1944–46. This was a special form of seismograph which measures microseisms that often occur with severe cyclones (not tornadoes). It was used with some success in detecting hurricanes far at sea during the autumn of 1945 and in following the passage of a few of the most severe storms of the extratropical type over the far north. Obviously there were limitations to its usefulness, but there appeared

to be possibilities of its further development and use as an auxiliary instrument for locating severe storms under certain circumstances while they were still beyond the range of regular weather observers and common meteorological equipment.

At least two other important developments in the general field of scientific equipment gave promise of opening new vistas in meteorology and possibly leading to revolutionary changes in the techniques of analysis and weather forecasting. The electronics computer, known by different names in Europe and the U.S., appeared to open the way eventually to computation of complex meteorological problems and perhaps to exact weather forecasting by mathematical process. The high altitude rocket, invented primarily for purposes other than meteorological, seemed to be the vehicle by which the conditions of the atmosphere might be measured right to its outermost limits eventually. During 1946, a modest beginning was made toward adapting the extremely rapid calculations of the electronics computer to solution of the difficult expressions involved in prediction of weather by mathematical computation. One phase of the plan called for projecting the much earlier work of L. F. Richardson in England into a practical, everyday working technique—the aim of meteorologists for many decades. Whether the aim could ever be brought to reality was uncertain, for there was much difficult research work yet to be done before the numerous steps in the problem could be reduced to mathematical expressions that could be solved by the electronic computer. Related to this in some respects were the results of the experiments with very high altitude rockets. The upper air data procured by rocket might give some of the quantities required for mathematical treatment of meteorological problems. Although their practical significance had not been ascertained, rockets equipped to measure air temperature and pressure reached altitudes in excess of 100 mi. during test flights in 1946. The device also measured certain radiant energy phenomena. First results were not entirely satisfactory, but they were indicative.

Among the meteorological inventions which had immediate practical use during the early 1940s were the automatic weather station and the ceilometer. There were also improvements in humidity-measuring devices, long a practical need in meteorology, especially in upper air measurements at low temperatures, but these hardly got beyond the laboratory stage and were not yet ready for service use. The automatic weather station had been under development for many years, and several different types were being tested in Europe and America before World War II began. Intensive experimentation between 1940 and 1942 led to the production of serviceable models, and many of these were used for obtaining weather reports from uninhabited areas, wastelands and ocean regions where it was difficult to maintain stations manned by observers. The automatic stations were designed to operate for several weeks or even months without attendants. They automatically transmitted by radio at intervals of a few hours coded reports giving the principal weather elements, usually atmospheric pressure, temperature and wind. The automatic weather station gave promise as a valuable peacetime apparatus for closing the gaps in the weather reporting network over mountainous regions and other inaccessible places of significance in daily weather analysis and forecasting. Even more widely useful than the automatic station was the recording ceilometer which was developed during 1943 and 1944. This device permitted frequent

measurements of the altitudes of cloud ceilings, information required for safety and economy in aircraft dispatching and navigation. By use of a modulated light beam whose reflection from the cloud base was triangulated automatically and recorded in terms of the cloud altitude, it was possible to operate the ceilometer in daylight as well as at night. During 1946, ceilometers were installed at many airport meteorological stations in the U.S. to replace the older, inadequate methods of measuring cloud altitudes by use of ceiling balloons in the daytime and by manually operated ceiling light projectors read visually at night.

Research and development in the techniques of weather analysis and forecasting during the decade 1937-46 aimed primarily at better utilization of newly acquired knowledge of the upper air. Attention was also directed more toward studies of the general circulation of the atmosphere and its relation to the structure and movement of air masses. Typical were the research studies prompted by the disastrous droughts in 1934 and 1936 over the U.S. prairies, which gave rise to smothering dust storms from the so-called dust bowl and caused years of economic depression throughout the area. A project at the Massachusetts Institute of Technology aimed at a better understanding of the general circulation of the atmosphere as a basis for extending the time scope of weather forecasts and perhaps anticipating droughts sufficiently to take economic countermeasures to forestall disaster. Although the research did not accomplish all that was hoped, it brought out important new concepts of the general circulation and contributed to progress in other ways. The project was transferred in 1940 to the U.S. weather bureau, where it became a regular service activity as well as a research program. The foundation was laid for future advances in this field when the huge task of compiling and analyzing 40 years of daily synoptic weather maps for the northern hemisphere was completed during the war. This series comprised about 15,000 different maps, each with more than 2,500 different entries representing the weather conditions at several hundred places spread over the hemisphere. It was probably the greatest single collection of analyzed synoptic weather reports of its kind anywhere. The work was undertaken by the U.S. weather bureau supported by the army and navy to provide maps for military planning and operations. The maps had permanent value as working materials for research not only in meteorology and climatology but also in other physical and social sciences which have problems wherein weather and climate are factors. In addition to the surface weather map series, the project also produced during 1943-45 several series of daily upper air charts for the 3, 10, 13 and 16 kilometre levels; and later in 1945, monthly charts showing the normal pressures and temperatures, the extreme temperatures and the normal winds over the hemisphere at six selected levels up to 19 km. A ten-year series of daily synoptic weather maps for the tropical Pacific, prepared for use during the war, served also as source material for research in some of the little understood aspects of weather changes in the intertropical zone.

One use of these historical weather maps was for research in the analogue method of weather forecasting. This method was one of several on which intensive efforts were made to increase the accuracy and time range of weather forecasts for military purposes. Almost from its beginning as an organized science, meteorology was faced with constant demands for long-range forecasts; demands regarded as quite reasonable by the interested public since many

supposed that annual almanac forecasts were authoritative or that techniques yielding accurate predictions in astronomy should be applicable and equally successful in meteorology, two sciences often confused in the public mind. But never had official pressure for long-range forecasts been more insistent than during World War II, when the success of strategic and tactical plans depended on correct evaluation of the effects of weather on large scale manoeuvres and co-ordination of effort among all branches of the armed forces.

In the all-out effort and the desire to overlook no possibility, every conceivable method or technique was thoroughly, almost desperately examined. Special research units were organized by the meteorological services of several leading combatant powers on both sides. To make sure the search was not limited by too orthodox an approach, a few of the units were composed of scientists other than meteorologists, and they tried entirely new physical and statistical approaches to the problems of weather forecasting. The results were analyzed by impartial outside groups. These exhaustive analyses in 1944 and 1945 gave no real evidence of skill in individual day-by-day forecasts for periods more than a few days ahead. Even when the experimental long-range forecasts were couched in general terms as to time and place and were allowed tolerances so liberal as to make them almost useless for practical purposes, they showed little or no superiority over climatological expectancy, and in some cases they were no better than random chance. The encouragement and support given to these projects were almost without limit, and many claims of progress were heard, but there was little real progress in the forecasting of individual anomalies more than a few days ahead. Only in very general monthly forecasts based on studies of the broad circulation of the atmosphere was even slight progress evident.

In the statistical treatment of weather and the use of climatological data to calculate the frequency or "probability" of occurrence of particular meteorological phenomena for use in estimating weather risks, however, the intensive work between 1939 and 1945 brought noteworthy improvements. Comprehensive treatises of weather and climate over practically all parts of the globe were produced in England, Germany, the U.S.S.R. and the U.S. They were used in almost every phase of wartime planning and operating. They were studied in designing clothing and other materials and equipment, in planning logistics and in deployment of forces in active theatres of war. Machine tabulation methods with Hollerith punched cards were used for compiling these weather statistics. Many of the procedures and improved forms were converted to peacetime commercial and industrial uses during 1945-46, with promise of lasting and far-reaching economic value. Meteorologists hoped these were the beginning of a renaissance in climatology.

Although general improvements in weather forecasting fell far short of the hopes of layman and scientist alike, there was real progress in short-term forecasting of certain varieties of weather. Aviation expansion and new requirements between 1937-46 led to remarkable progress in the forecasting of cloudiness, cloud ceilings, fog, visibility and icing conditions aloft. Perhaps the most striking improvement from the standpoint of public interest and direct eco-

Field workers on a snow survey in western U.S. during 1939. Findings of such surveys were co-ordinated by the U.S. department of agriculture to estimate irrigation water supplies each year according to the amount of water in the snow

conomic value was in prediction of hurricanes. With reports radioed from military and naval reconnaissance planes which gave frequent and accurate fixes of a hurricane's position, reports supplemented occasionally by radar and spherics observations, forecasters were able to predict more accurately than ever before the intensity and movement of these severe storms. Never had life and property been so well protected from hurricane damage as it was after 1941. There was progress also in the forecasting of rainfall quantitatively, in river stage and flood forecasting and in season-long forecasts of water supply from snow-melt in some of the river valleys of the western U.S. From comprehensive studies of storm precipitation records, methods were devised for estimating maximum run-off within certain limits and thus engineering data were provided for use in designing flood control reservoirs and dam spillways.

Accumulation of upper air data led to emphasis on objective methods for evaluating the hydrodynamic and thermodynamic reactions involved in weather changes. These studies aimed to supplement or displace the previously used methods of indirect aerology. In the effort to integrate these dynamic factors into the preparation of the daily prognostic chart, several different forms of "energy" charts or diagrams were employed. Shaw's tephigram was rather widely used at first. Rossby's isentropic charts were adopted in the U.S. and used for several years, but by 1946 common practice again trended toward use of cross sectional charts, in most cases profile diagrams and constant pressure charts. Adequate working tools for fully utilizing upper air data in the daily routine of weather forecasting had not yet been devised. Many forecasters still considered the tephigram and the isentropic chart the best available means of evaluating the dynamic aspects for which they were specifically designed.

Literature and Organizations.—The meteorological literature of the decade naturally reflected the quickened tempo and broader outlook of the science and its applications. Innumerable monographs and technical articles were produced, many of them not released for publication because of their military origin. Among the new periodicals should be mentioned the *Journal of Meteorology*, a quarterly for technical papers, inaugurated by the American Meteorological society in 1944; and a popular monthly called *Weather*, which began publication by the Royal Meteorological society, London, in 1946. After the close of World War II, many articles began to appear in the daily press and in magazines describing new applications of meteorology to agriculture, commerce and industry. A very good series on this subject appeared with the daily weather maps published in Washington.

Meteorological organizations encouraged dissemination of this information for the purpose of broadening the base of applied meteorology and creating a demand for the professional services of meteorologists trained during the war who were ready to return to private life in 1945. It was hoped to expand the relatively new field of private practice in the meteorological profession. This movement came primarily in the U.S., having originated during the days when aviation requirements outstripped weather bureau facilities and private industry found it necessary to employ meteorologists to supplement the government's services. Later the development was encouraged as a means of stimulating meteorological progress and expanding its practical applications, thus increasing its economic value. In most countries, however, the government held that meteorological services were too closely related to public wel-

Experimental detector used to measure the height of cloud ceilings during the day; it was equipped with a photoelectric cell mounted at the focus of a reflector

fare and individual meteorologists too dependent upon the weather reporting and communication facilities of government to allow independent or competing services by private practitioners.

In international co-operation, meteorology had always been outstanding. Daily and sometimes hourly exchange of weather reports among nations is quite essential. Air masses move across national boundaries and the weather everywhere is more or less interrelated through the general circulation of the atmosphere. The International Meteorological organization, established in 1878, was relatively inactive during World War II, but its functions were carried on for the United Nations by the Combined Meteorological committee in Washington. The I.M.O. was reorganized by a special meeting of directors of meteorological services in London in February 1946; more than 40 nations were represented. Other outstanding events in international co-operation in meteorology were the training school for Latin-American students in meteorology in Medellín, Colombia, in 1943 and later extension of this program to provide for graduate training for selected students who were sent to universities in the U.S.; establishment of the Institute of Tropical Meteorology in Puerto Rico through joint action of the universities of Chicago and Puerto Rico; extension of the network for weather observations in the far north through co-operation among the meteorological services of Canada, Greenland and the U.S.; and agreement to maintain the network of weather station vessels established in the Atlantic during the war. This last mentioned agreement was accomplished in July 1946 through the Provisional International Civil Aviation

organization (P.I.C.A.O.) as the result of co-operation among the countries of western Europe, Canada and the U.S. (F. W. Rr.)

Great Britain.—Among the most outstanding British advances in meteorology during the years 1937–46 was the development of methods of representing the atmosphere as a three-dimensional structure. This was made possible by a considerable extension of the network of observations of pressure, temperature and humidity in the upper air, the observations being plotted either on constant level charts or on pressure contour charts.

The artificial dissipation of fog had been previously shown by meteorologists to be practicable, while preliminary experiments had confirmed this. As the result of a thorough investigation carried out in England during World War II, suitable equipment was evolved for installation on aerodromes, and was used on a number of occasions of widespread fog to enable returning aircraft to land in safety on English aerodromes. The equipment consisted of lines of high-efficiency burners consuming gasoline and giving intense heat without smoke, capable of being brought into action at very short notice.

The formation of cloud and rain was the subject of much discussion, and findings were summarized by G. C. Simpson in an article in the *Quarterly Journal of the Royal Meteorological Society* (67, 99, 163; 1941). Although it was long recognized that condensation of liquid waterdrops took place on nuclei, as demonstrated by J. Aitken, the formation of ice-crystals in the atmosphere was not understood. Observations by G. M. B. Dobson and B. M. Cwilog showed that when air was expanded adiabatically in a chamber so as to produce saturation, the highest temperatures at which ice-crystals appeared were quite sharply defined: -41° C. for air freed of nuclei; -32.5° C. for outdoor air; -27° C. for air contaminated with tobacco smoke. In the course of this work it was found that when the temperature was below about -83° C., rather large grains of ice similar to soft hail were formed, instead of ice crystals. Dobson and Cwilog developed an instrument capable of measuring accurately the humidity in the upper atmosphere by taking the frost-point temperature, i.e., the temperature at which ice is formed by direct condensation in very cold air; the use of this instrument showed, in all the ascents into the stratosphere obtained, that the air in the stratosphere was very dry. These were the first direct observations of humidity in the stratosphere.

The vexed question of the electric polarity of thunder clouds was settled, and it was generally agreed that the upper part of the cloud, roughly the part where the temperature was below -10° C., was positively charged, and the lower part with temperature between -10° C. and 0° C. negatively charged, while in some thunderstorms there was in addition a small volume of intense positive charge in the lower part of the cloud, in the region where a large quantity of condensed water was held in suspension by the upward convection currents. The positive charge was explained by the splashing of the drops during collisions, in the manner described by Simpson in 1909.

Dobson showed that the vertical temperature distribution in the stratosphere and the change with height of the annual variation of temperature at very high levels could be explained qualitatively as the result of radiation and absorption by carbon dioxide, water vapour and ozone. Some progress was made in understanding the details of the transport of energy through the atmosphere by radiation, and it became evident that in heat transport radiation was much less important than turbulence, convection and condensation in ascending damp air.

Although the causes of pressure variations in the atmosphere had not been fully elucidated, there was some progress, and valuable contributions were made by R. C. Sutcliffe, R. W. James and S. Petterssen. Sutcliffe related the production of low pressure at the surface to the existence of convergence of the a-geostrophic wind at low levels, and of over-compensating divergence in the upper troposphere. He also emphasized the effect of vertical motion in producing departures of wind from geostrophic. The work of James and Petterssen showed that the pressure tendency at the surface is compounded of (a) the surface pressure times the convergence of the isobaric mean wind (means of winds at equal intervals of pressure) of the whole atmosphere and (b) the component of the isobaric mean wind normal to the surface isobar times the gradient of surface pressure.

The factors affecting visibility were clearly enumerated by H. L. Wright, who showed that sea-salt nuclei, being much larger than combustion nuclei, played a more important part in the determination of visibility. The latter were only of importance when they were extremely numerous. According to Wright, only the number and size of sea-salt nuclei and the quantity of solid pollution needed to be taken into account in determining visibility, the Aitken dust counts being of no value in this regard.

Weather of the Decade.—In a ten-year period, almost anything can happen to the weather, and almost everything in the meteorological lexicon did happen at one place or another during the decade 1937–46. Only a few of the most outstanding can be mentioned to illustrate the variety of the many weather events of the period.

The drama of weather in the decade was opened in Jan. 1937 by one of the most disastrous floods in U.S. history. Protracted rains and warm weather which melted snow on the still-frozen ground caused the Ohio river and many of its tributaries to overflow their banks, and in many localities all previous records of flood stages were surpassed. Damage to industrial and residential property was unusually heavy. At the same time in the western half of the continent, all-time records for cold were broken, especially in Montana and California. Two of the most severe freezes ever experienced in the citrus country of California caused disastrous losses to trees and fruit. On the U.S. prairies, 1937 was another year of subnormal rainfall, and in Kansas record droughts were again experienced. Coming right after the severe drought years of 1934 and 1936 and the "dust bowl" with its desiccating winds and dust storms, the continuing deficiencies in rainfall were doubly serious. In other parts of the world, 1937 produced its quota of storms and unusual weather, but in general these were not as record-breaking as were

the floods and droughts of North America.

The year 1938 was characterized by abnormally warm weather throughout the northern hemisphere. From scattered reports in the Arctic it was concluded that surprisingly high temperatures prevailed in that region, and in the U.S. practically every station showed above average temperatures for the year. In the British Isles, the most severe drought in a century occurred, one locality having been wholly without precipitation for 33 consecutive days. Compared with normal, March was relatively the warmest month in most regions. Probably the most devastating storm of the year was the New England hurricane which swept northward along the Atlantic coast Sept. 16-22, causing the loss of more than 494 lives and property damage totalling more than \$200,000,000. It was the first West Indian hurricane in a century that had followed a route close to the populous cities on the U.S. eastern seaboard and retained such destructive force until it reached Canada. Outstanding also was the number of tornadoes during the year. These storms, much smaller in area than

a hurricane but even more destructive locally, numbered 220 during the year and caused damage estimated at \$9,000,000. They occurred in 33 states and resulted in approximately 1,500 personal casualties, 183 of them fatalities.

The years 1939 and 1940 saw less disastrous weather than the two preceding years, although storms and other abnormalities in one part of the world or another still made frequent headlines. Unusually severe cold was experienced in Europe early in 1940. England reported the coldest January since 1838, and ice conditions in the Baltic, on the Danube and rivers of western Europe were the worst in a century. Ground froze to a depth of 16 in. in some parts of England, and the Black sea froze over at Odessa. In the ice storm and snow of Jan. 26-29, 1940, the ice coating on trees and wires attained a thickness of four in. in some parts of the British Isles and remained several days before melting. Toward the close of the year, on Armistice day, a driving blizzard and severe cold wave swept down from Canada and engulfed the northern plains and Great Lakes areas of the U.S., causing a temperature drop of 50° F. within 24 hours in many localities.

It was the most severe wind storm ever recorded in the upper Lakes region and caused the loss of 166 lives and damage to property probably exceeding \$8,000,000.

The cold weather during the winter of 1941-42 in eastern Europe was assured a prominent place in history because of its influence on military operations on the Russo-German front. As in several other major campaigns of the war, the weather was a factor in deciding the outcome. Foreknowledge of and preparation for decisive meteorological conditions more than once changed impending defeat into eventual victory. Such was the case in the exceptionally stormy period over the English channel during early June 1944, just preceding and during the "D-day" operations, when successful co-ordination of military arms on land, sea and in the air depended upon selection of a day with certain conditions of weather. The start of the invasion was postponed one day in the light of the meteorological outlook. Again in Dec. 1944, the German break-through in the battle of the Bulge was halted when unusually good flying weather during Dec. 23-30 enabled the defending forces to make full use

Table I.—Average temperatures in °F. in typical cities of the United States with comparative data showing high and low years during 1937-46

Cities	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Annual	Years

of their combatant aircraft. The entire record of World War II was so replete with such situations that some writers made hyperbolic reference to it as the Weather War.

In Sept. 1944 the second destructive hurricane in six years struck the New England coast. This time the populace remembered the 1938 storm and took heed of the warnings of gale winds and high tides. The loss of life was greatly reduced, the total deaths from the storm being 46.

Damage to immobile property and to small craft that could not be protected was heavy. The wind velocity at Chatham, Mass., attained 105 m.p.h. In the southwest Pacific, where tropical cyclones occur more frequently than in the Atlantic, the vessels of the U.S. fleet suffered losses from typhoons during both 1944 and 1945. The Okinawa typhoon of Oct. 1945 was very destructive to shipping and to shore installations, but advance storm warnings made possible by aerial reconnaissance kept loss of life to the minimum.

During 1944-45, Australia suffered the worst drought in its history. It was estimated that 20,000 sheep perished as a result of the cumulative effects of unbroken dry weather, and total damage exceeded \$250,000,000. In Sept. 1946 exceptionally heavy rainfall in Ethiopia caused the highest flood waters in the Nile in 90 years. In Colorado, November recorded the heaviest snowfall in 33 years, piling drifts 10 ft. deep in parts of Denver. The last month of the decade brought reports from Siberia of the lowest natural temperature ever recorded on the surface of the earth (-94° F). December also brought strong gales to

western Europe that caused heavy damage to shipping, and ice storms to the eastern U.S. that resulted in several fatal aircraft accidents. Perhaps the characteristic feature of the weather toward the close of the decade was the continued trend toward higher average temperatures in most parts of the world from which weather reports were obtainable. Meteorologists considered this only a phase of the irregular 25 to 50 year-swings on either side of the "normal" and expected a reversal toward moderately lower average temperatures within a few years.

The accompanying tables show the average values of temperature and rainfall for a number of typical localities. (See also DISASTERS; FLOOD CONTROL.)

Methodist Church

The decade 1937-46 covered the most eventful years in the history of U.S. Methodism. It marked the reunion in one body of three churches, originally one, but separate for a century or more, which comprised nearly nine-tenths of all the Methodists on the continent. This consummation of the most important union, in point of numbers, which had occurred in Christian history indicated the trail for similar unions of other denominational families, and eventually of U.S. Protestantism. The three uniting bodies were the Methodist Episcopal Church (5,092,465 members), organized in 1784; the Methodist Protestant Church (198,000 members), dating from 1828-30; and the Methodist Episcopal Church, South (2,771,240 members), which separated in 1844 and was organized as an independent church two years later. These groups had divided on questions of polity, not of credal differences. All were true to the basic doctrines formulated in the middle of the 18th century in England by the Reverend John Wesley for "the people called Methodists."

The Methodist Protestants represented a democratic protest against the authority of the bishops and the exclusion of lay members from any voice in the government of the church. The breach with the Methodists south of the Mason and Dixon line was the first alarming evidence of the tension which eventually was to lead to secession of the Confederate states. After the American Civil War, the two major Methodist bodies, each strong in its own section, began to infiltrate each other's territory, creating constant friction. "Northern" conferences were organized in every southern state, and westward movements of population developed "Southern" Methodist conferences in California and the Pacific northwest. It took decades of such rivalries before Methodist statesmen on both sides awoke to the fact that "the Methodists are one people," and several more before they were in a temper to settle their differences around a council board.

Sectional and racial factors complicated the problem. The first protocol was rejected by the south, and another decade elapsed before a plan of union was accepted by both groups and in the so-called Uniting conference in Kansas City, Mo., in May 1939, became the constitution of the new Methodist church. Meanwhile, both these "episcopal" bodies had so curbed the power of the bishops and admitted laity to so large a share in the direction that the Methodist Protestants asked to be included and were admitted to the union. The plan of union set up a general conference, composed of equal numbers of clerical and lay delegates, meeting quadrennially; a judicial council sitting as a court of appeals; and six regional jurisdictions in the United States, five of them with territorial boundaries and names and the sixth, nation-wide called "central," comprising the Negro membership of the former Methodist Episcopal and Methodist Protestant churches.

Each division had its own jurisdictional conference, meeting once in four years, which had charge of its local interests and power to choose its bishops. These were still rated as "general superintendents," though their residence and administrative action was restricted to their respective

jurisdictions. The bishops of all the jurisdictions belonged to the council of bishops, meeting at least once a year to consider church-wide interests and to initiate plans for common action. Back of all these groups were the annual conferences, about 100 in number, administering local affairs and electing delegates to the general and jurisdictional conferences. The annual conference, a distinctive feature of Methodist polity throughout the world, was made up of the ministers and one lay member from each pastoral charge.

Despite bitter opposition from a southern group, which took to the South Carolina and federal courts questions as to the validity of the legal process of union and challenged the claim of the Methodist church to exclusive use of the former name Methodist Episcopal Church, South, the plan of union was upheld and the right to use the names of the uniting bodies was confirmed. Nothing came of the threat of a "wee free" organization. The number of "die-hards" who withdrew to enter other denominations was negligible.

After the action of the uniting conference came the business of reorganizing the administrative machinery of the united Church. The administrative agencies of the three churches were replaced by seven boards, namely: publication, missions and church extension, education, hospitals and homes, temperance, evangelism and lay activities. The many interests of the former women's societies were assigned to a division of the board of missions and church extension, entitled "Woman's Society of Christian Service." The words "prohibition and public morals" were dropped from the designation of the former board of temperance.

Jurisdictional Conferences.—The jurisdiction was an innovation in Methodist polity. It was a basic provision of the plan of union, devised as a means of protecting the southern group from domination by the northern majority of a general conference, the lawmaking body. Without some such check it was evident that no plan of union could have been accepted. It also made possible the inclusion of practically all the Negro members in one jurisdiction, the central. This provision was offensive to some Methodists of both races as being a segregative measure, and constituting an un-Christian discrimination on account of colour. Yet it proved generally acceptable to most of the Negro leaders, since it secured to their race the right to choose their share of bishops, and full and equal representation in the general conference and on all administrative boards. Moreover, it was a natural application of the existing practice in the Methodist Episcopal and Methodist Protestant churches of maintaining separate annual conferences for Negroes. (The Southern Church had few Negro members, having encouraged its former membership of that race to organize as a distinct denomination after the Civil War under the name of the Colored Methodist Episcopal Church.)

Two series of jurisdictional conferences were held after the union, in 1940 and 1944. Apart from the absorbing and often exciting business of electing bishops, they found very little to do except listen to speeches and reports. The complaint was heard that the jurisdictional conference was "a fifth wheel," unnecessary and superfluous machinery in a church already highly mechanized. It was urged, moreover, that the elections should be returned to the general conference. The smaller group, it was argued, lent itself to the art of "log-rolling," and limited the field of choice. It was claimed that the bishop thus selected and restricted to his own jurisdiction no longer had the prestige of the former bishop, elected by the whole

church from anywhere in the church, who could "travel at large through the connection" without trespassing on any other episcopal domain, and presiding with full authority over any annual conference between the two oceans. One jurisdiction, the southeastern, undertook to find a way of doing something, having set up an executive office with a full-time secretary and an expense budget; also the far-flung western jurisdiction, stretching from Pike's Peak to the Golden Gate, inaugurated a small *ad interim* body of 25 members, as a council, to make possible more effective discharge of its functions. Unless the field of jurisdictional activity became more definite, and more effective methods of cultivation were developed, this feature of the new constitution might be remodeled, though it was not likely to be eliminated as long as the sectional differences of ideology continued.

Attitude Toward War.—World War II brought with it difficult problems to this world-wide church. For years its world peace commission had preached pacifism, or something like it. Its leading pulpits absolutely condemned all war. The general conference of 1940 met in a world at war. The question of the attitude of the Methodist church toward a possible U.S. entrance into the conflict could not be avoided. Indeed, it was pressed with great vigour and ability. The debate resulted in a declaration that the church could have nothing to do with war, if it should come.

After Pearl Harbor, however, at least 1,000,000 boys from Methodist homes enlisted or were drafted. Methodist ministers to the number of 1,600 left their charges to serve as army or navy chaplains. Bishop Adna W. Leonard, on a tour of duty among the chaplains in the field, was killed in the crash of an army plane in Iceland and buried there with military honours. The general conference of 1944 met in a changed atmosphere. The forces which had won the antiwar victory four years before, came up with a resolution reaffirming the previous action. They won in the committee, but in the full house, after a great debate, the committee report was rejected by the narrowest of margins. The vote was taken "by orders," the ministers and laymen voting separately, with concurrence of both orders necessary. The laymen gave a substantial majority against the report. The ministers concurred by a majority of a single vote. The final action was strong in its condemnation of war, as a means of settling disputes, but omitted the declaration that the church must keep aloof from it. As the war went on, the Methodists went with the country, responding loyally to every call of the government. However, it was true that, while Methodists co-operated vigorously in the U.S. war effort, Methodist "conscientious objectors" outnumbered all others, except Quakers and Mennonites.

Crusades.—A movement, popularly known as "The Bishops' Crusade," because it was initiated by the council of bishops, brought to the Methodist church in 1942-43 the importance of applying Christian principles to the organization of the peace after World War II, which was then at its height. At a notable conference in Delaware, Ohio, in March 1943, several distinguished speakers discussed the basis of a new world order and their addresses had wide circulation in book-form. Later, a series of meetings were held in important centres throughout the nation under the direction of the bishops, in which the principles which should dominate the peace settlements were emphasized and the people were urged to write their senators and congressmen in support of these principles.

Following the bishops' crusade came the crusade for Christ. After thorough preparation, the general confer-

ence of 1944 set up a commission which was charged with conducting five specific denominational activities in the quadrennium 1944-47. These were (1) the raising of a fund of \$25,000,000 to be expended for restoration, rehabilitation and advance of activities, institutions and programs which had been arrested or otherwise damaged by the war, directly or indirectly; (2) to check, and if possible, reverse the alarming decline which had affected enrolment and attendance in Methodist Church schools (*i.e.*, Sunday schools) for a decade, a loss which was not peculiar to this denomination; (3) to promote an evangelistic campaign with the objective of adding a million members; (4) to spread the principles and practice of Christian stewardship, *i.e.*, systematic devotion of a definite share of one's income to Christian benevolence; and (5) to work for a new world order, to do away with war, organize for peace and remove the causes of racial and industrial strife. This program was prosecuted with characteristic vigour and method, quotas being assigned to each unit—area, conference, district and pastoral charge. The first objective, \$25,000,000, the largest sum ever asked of the church in a single year, was promptly pledged and paid. The pledges ran up to \$27,777,663, on which \$26,668,847 had been paid in cash up to Sept. 1, 1946. Evangelism, the third objective, made some progress toward its goal of 1,000,000 accessions to membership within the year. The council at its session in Sept. 1946 appointed a committee of 12 of its number to lead a church-wide attack on the belief that a third world war was inevitable.

War Rehabilitation.—U.S. Methodists expressed their sympathy for the suffering people in the war-devastated countries of Europe and Asia by generous contributions for their aid. A special overseas relief organization for collecting and distributing these funds was set up by the general conference and placed under the direction of Bishop Herbert Welch. Its operations started even before Pearl Harbor. As early as 1940, on a day designated as "sacrificial Sunday," the Methodist congregations gave \$125,323 for this purpose. A year later, on a similar appeal, the people responded on the "day of compassion" with \$400,000. The offerings for 1941-42 aggregated \$180,000; in 1942-43 they reached \$464,049; and as the wounds of war became wider and deeper, all former figures were topped by offerings of \$612,726 in 1943-44 and \$671,296 in 1944-45. In the fiscal year which closed May 31, 1946, the total receipts for overseas relief were \$1,531,547, which total, however, included \$900,000 from the crusade for Christ. Apart from this crusade appropriation, the total direct gifts of the Methodist church for overseas relief during the war years amounted to \$3,153,868. More than one half (56%) of this sum was distributed by other than Methodist agencies to sufferers without regard to race or denominational connection. Such agencies as the Y.M.C.A. and the Friends Service Committee received large appropriations for their broad humanitarian programs, and these were skillfully transformed into food and clothing for distressed multitudes of innocent people. China was the largest beneficiary. In its share was a gift of \$56,000 for Madame Chiang Kai-shek's "War Orphans," but no nation, not even Germany, was overlooked in the distribution of the bounty. All of this money was devoted to the relief of suffering humanity. None of it was included in the large gifts from the crusade for Christ, which went from U.S. Methodists for the restoration of the more than 1,500 British Methodist churches and parsonages destroyed or damaged by the "blitz."

Publishing.—Methodists in every part of the world-parish followed Wesley's example by setting up printing-presses and circulating books and periodicals. In 1789, when the church in America was but four years old, it launched the Methodist Book Concern, which grew to be the largest religious publishing house in the world. The Methodist Protestants and the southern Methodists promptly did the same. Naturally, one of the first consequences of unification in 1939 was to consolidate the publishing organizations of the three churches under the name, "Methodist Publishing House." Large economies were effected by discontinuing the manufacturing plants in Baltimore, Pittsburgh and New York city (Dobbs Ferry) and concentrating production at Nashville, Cincinnati and Chicago. The number of periodicals was reduced from over 50 to 24, adapted to every need of the Church (Sunday) Schools. The *Christian Advocate* "family," formerly published in numerous regional editions at heavy loss, was broken up and replaced by a single well-staffed weekly under the historic name and issued from Chicago. Its editorial policy aimed to produce a church paper which should appeal to the average layman and laywoman. Circulation rose so rapidly that the *Advocate* became not only self-supporting but profitable. By Aug. 1, 1946, the circulation had reached 345,000, believed to be a high mark among papers of its class.

The Methodist Publishing House, having its chief offices in Nashville, Tenn., and operating a chain of stores in fourteen populous centres across the nation, prospered greatly during the decade. In the year which closed July 1, 1946, it did a business of \$8,830,000, as compared with the \$5,500,000 in aggregate sales of the three constituent houses in the year before the union. In this year (1946) as in the year preceding, it was able to distribute \$400,000 among the retired ministers, after large expenditures for equipment and the accumulation of a substantial reserve, exceeding \$2,000,000. After the year of union, the house distributed \$1,815,000 to these beneficiaries. The publishing output of 1946 was 2,177,261 volumes, together with a circulation of 5,448,774 copies of church school lesson helps and story-papers. The imprint "Abingdon-Cokesbury" was employed on the general religious books, as distinguished from its distinctively denominational issues. Nine of its publications were honoured by inclusion in the American Library association's list of fifty outstanding religious books of 1945-46. The house also published *Religion in Life, a Christian Quarterly*, edited by Dr. Nolan B. Harmon, with an Editorial Board representing the leading denominations. Closely associated with these publications was *The Upper Room*, a quarterly manual of daily devotion which had a world-wide circulation of three millions.

Missions.—While the "long years" of the business depression had their effect on the general giving of the church, the wartime prosperity registered large gains. Indebtedness on church property was reduced by more than one-half, and the heavy debt of the board of foreign missions (Methodist Episcopal) was entirely lifted. The mission fields in Europe, Asia and Malaysia were hard hit. Property in the path of armies was destroyed, and the drafting of pastors, displacement of populations and the organization of Methodist youth into Hitler youth groups played havoc with the churches of Central Europe. In China, Japan, Korea, Malaysia and the Philippines, conditions were even worse. The missions office reported to the general conference of 1944 that the force of 773 active mis-

sionaries of 1942 had dwindled to 630, of whom only 402 were on their fields. Some had found work in other lands or at home. After the war, however, doors reopened for their return, and they streamed back and were warmly greeted by the distressed people of the Christian communities. While much costly restoration of church and school property had to be done, large plans for expansion were made and young people were recruited and trained for missionary service. General respect for the missionary enterprise was increased by reports that sifted back from chaplains and other service men who had seen personally the transformations wrought by a century of missionary effort among the people of the Pacific Islands. The great response to the appeals of the crusades and for Overseas Relief was evidence that the missionary urge was still powerful among the Methodists.

Plans.—The Seventh Ecumenical Methodist conference, which was to be held in Oxford, England, in Sept. 1941, was abandoned on account of World War II and later was scheduled for the United States in 1947. These bodies, made up of representatives of world-wide Methodism, had met decennially since 1881. Though having no legislative power, they exercised a formative influence on Methodist policy. Another development of the decade was the organization of the Methodist Youth Fellowship in the Methodist church. It replaced all other young people's societies and showed marked vitality. In 1946 it began publishing at Nashville, Tenn., a bi-weekly organ, *Concern*. The Fellowship planned an international Methodist Youth conference, to be held in Cleveland, Ohio, in 1947 which was expected to bring together 10,000 young people. The Fellowship demanded representation of at least 15 members in the general conference of the Methodist Church.

Mexico

Mexico, a federal republic adjoining the United States on the north and Central America on the south, had an estimated population of 21,672,733 in 1945, and an area of 758,061 sq.mi. By the census of 1940, the population was 19,653,552—about 55% mestizo, 29% Indian and 15% white. The predominant language is Spanish, with an estimated 14% speaking only Indian languages or dialect. The population is overwhelmingly Roman Catholic.

Mexico City, the capital, had an estimated population of 1,464,556 in 1945 (1940 census, 1,448,422). Other principal cities: Guadalajara, 228,049 (1940, 229,235); Monterrey, 180,942 (1940, 186,092); Puebla, 137,324 (1940, 138,491); Mérida, 98,334 (1940, 96,852); León, 86,089 (1940, 74,155); Tampico, 81,334 (1940, same); Aguascalientes, 81,124 (1940, 82,234); San Luis Potosí, 78,042 (1940, 77,161); Torreón,

76,613; Veracruz, 70,958 (1940, 71,679); Chihuahua, 57,456 (1940, 56,805); Pachuca, 52,387 (1940, 53,354). Presidents during the decade 1937-46 were Lázaro Cárdenas (1934-Dec. 1940); Manuel Avila Camacho (Dec. 1940-Dec. 1946) and Miguel Alemán (took office in Dec. 1946). (X.)

Agrarian Revolution.—In his last annual message to the congress (Sept. 1, 1946) President Avila Camacho stated without further commentary that, "The redistribution of the rustic property cannot yet be regarded as terminated." His successor, Miguel Alemán, in the platform on which he campaigned, declared it necessary "to continue the agrarian policy of the government of the revolution until the want of all *ejidatarios* [organized peasants] who have not yet received lands is satisfied." At the close of the decade that began in 1937 there were still landless peons in Mexico, and toward the end of Sept. 1946, the disturbances on the part of land hungry peasants registered in the state of Tlaxcala were significant. Nevertheless, the history of the country through the ten-year period was largely the fulfilment of the land distribution promised as far back as 1810, when the curate of Dolores launched the movement for independence with the cry of *Tierra y libertad!*

Father Miguel Hidalgo y Costilla laid stress on land as essential for true liberty. So it was then and so it was at the end of the decade 1937-46 in a country so largely agricultural and whose other natural resources had been mostly foreign-owned. However, after Hidalgo's capture and execution while on his way northward to enlist, as he hoped, the support of the United States, the ups and downs of the movement were such that by 1821, when independence was achieved, his simple program had yielded to other aims cherished by the landed gentry and the clergy. From then on, until the revolution that flared up in 1910 was well advanced, the history of Mexico turned mainly on the growth and vicissitudes of a Liberal movement to wrest political power from the privileged groups, a condition more easily grasped by the developing middle classes than by the illiterate peasants who formed the bulk of the population and who—nearly 100% of Indian stock—demanded ownership of the land of their ancestors. This demand went unheeded, but at a crucial moment Venustiano Carranza—leader of the Liberal movement at that time—issued at Veracruz the decree of Jan. 6, 1915, ordering the return to the peasants of all lands illegally taken from them in the past. This was designed to draw to the Liberal side, or at least to counteract, the strong land-reform movement led by Emiliano Zapata; but it achieved much more: it gave *la Revolución* a paramount agrarian character. Mexicans seem agreed to hold the effective enforcement of that decree (enlarged and incorporated in article 27 of the 1917 constitution) as the yardstick, together with the norms of "Effective Suffrage" and "No Re-election," for measuring the success of the various governments that had ruled the country in the name of the revolution. By this standard, the ten years 1937-46 were the most truly revolutionary of all. The land reform was a pledge which not until that decade found an administration in a position to redeem it vigorously. The same could be said of the two political norms mentioned.

Lázaro Cárdenas, inaugurated president of the republic on Dec. 1, 1934, had had no need to wage a strenuous electoral campaign. As the candidate of the powerful National Revolutionary party (P.N.R.) his victory at the polls was assured; yet he undertook to visit not only all the cities and towns accessible by modern transportation but many of the outlying regions of the country, intent on reviving the common people's waning faith in the revolution. A printer's apprentice in the small Michoacán town of Jiquil-

pan, he joined the ranks of the revolution when only 17 years old, in 1913, and in 20 years of army service, through labyrinthine political contentions that were resolved mainly by force of arms, rose to a full generalship, to the governorship of his native state and to be the head of the war department, having gained a name as a humane chieftain, an idealist and a friend of school teachers. Ernest Gruening, a ruthless critic of the Mexican army as it was in 1926, had singled him out for exceptional praise in the book *Mexico and its Heritage* (New York, 1928). After becoming president, Cárdenas was forced to deal adroitly in order to extricate himself—and the country—from the influence of former President Plutarco E. Calles, who went into exile. Out of this struggle Cárdenas emerged as one of the forceful personalities of Mexican history. He was determined on the land reform.

On Oct. 6, 1936, he decreed the expropriation and redistribution of the cotton and wheat lands of the Laguna region. Momentous significance was attached to this measure. Even in the best of circumstances the land reform could not but be difficult. It was difficult to determine what lands could be rightfully seized and redistributed, and to whom; difficult to assess the value of such lands in order to provide payment for the ousted owners; difficult to deal with these outraged and by no means powerless individuals, aliens as well as nationals of Mexico, who fought the reform by fostering revolts, involving the country in wars of religion and in foreign claims, using among other weapons the rejection of the government bonds and thereby lowering the nation's credit at home and abroad; difficult, finally, once the lands were conveyed to the peasants, to aid these new owners—and aided they had to be—in carrying on agricultural production without much loss of volume. From the date of the Carranza decree to Nov. 31, 1934, 17,000 land petitions by that many peasant groups were filed with the government, but in all those 19 years, only 4,674 petitions were fully resolved favouring 793,442 families. In contrast, once the Cárdenas administration found its stride, 5,956 petitions were resolved in a single year (1935-36) benefiting 565,216 family heads. In 1937 that tempo was sustained. The highlight of this undertaking was the Laguna expropriation, which destroyed whatever hopes or fears may have been entertained that the revolution might fall back again, as it had so often done, to an easier pace after a spasmodic sprint. The land reform could not be stayed, and conviction of this was one of the factors that brought peace to the country.

Large portions of the countryside had been kept in turmoil of armed revolt in the preceding decade. Now, with the definiteness of the land reform, the movement subsided, and the elements opposed to the revolutionary program hinging on the agrarian issue channelled their efforts along other lines: the formation of open political groups which under the law could contend for leadership of the public opinion and for public office. Fanatics had contrived to fight the Liberal heritage of the revolution by fighting the land reform, but when this attitude proved futile, *Sinarquismo* was launched in May 1937—a movement denounced at times as harbouring secret fascist aims but with leaders described as staunchly independent of foreign influences and as resolute against resort to arms. In certain states, especially Guanajuato, *Sinarquismo* enlisted many thousands of followers—peasants and artisans—much given to protestations of nationalism in public demonstrations with banners. To those of its component groups who demanded it, lands were granted and agrarian

colonies were formed that met with varying success. Feuds among its leaders, however, later weakened *Sinarquismo*. During the 1946 electoral campaign, nevertheless, it developed a political arm, the *Fuerza Popular* party, which succeeded in electing one member to the congress. A second antirevolutionary movement, often linked with *Sinarquismo* but repudiating the charge, was *Acción Nacional*, which had slight beginnings in 1933. In June 1939, it was revived, ostensibly under the leadership of certain prominent corporation lawyers, in Mexico City. It devoted much effort to recruiting a following among conservative businessmen. It specialized in conferences for the discussion of economic problems and for sharp criticism of the revolution as a whole. It too became a political party, the P.A.N., in the 1946 elections. Having failed to draft Luis Cabrera as its nominee for president, it entered only candidates for congress and won a few seats in the lower house. Cabrera was the minister to Carranza who in 1915 wrote the famous land reform decree but afterward became a constant critic of the land redistribution.

Laguna.—The Laguna expropriation, culmination of the agrarian revolution, and the progress made there, were described by an enthusiastic economist (Clarence Senior, of the University of Kansas City and the University of Puerto Rico) as *Democracy Comes to a Cotton Kingdom*, the title of a pamphlet distributed in the United States by the League for Industrial Democracy. The Laguna is an area bestriding the states of Coahuila and Durango over some 1,500,000 acres, the corner of a rainless desert, which two seasonal streams flood annually. Here, in 1936, lived 128,795 people in the city of Torreón—then a forty-year-old commercial and industrial centre—and in a few smaller towns nearby, while in the countryside 111,790 persons formed 368 scattered settlements of families, dwelling for the most part in mud-floored huts and even in caves underground, bound to the soil not by legal chains of peonage but by conditions of poverty and ignorance which were a worse bondage. At cotton-picking season this population more than doubled, then dwindled away with the dust the winds lifted and scattered, folding the carpets on which they had bet and lost in games of chance.

The land reform proclaimed in 1915 had made fitful headway throughout the country, and had even drawn near the Laguna, halting there. The Laguna afforded fortunes yearly which became legendary. This wealth accrued largely to absentee owners. Part of the land was farmed out to people who paid high rental for it, gambling on the abundance of water and the eventual yield. The effect of the Laguna immunity to the land reform, together with laxity elsewhere, depressed the people generally. Therefore, along with the considerable economic betterment of the peasants in the Laguna, the spiritual gain for the common people in restored faith was regarded as one of the accomplishments of that expropriation.

The Laguna "experiment," as it was widely known, brought in its wake a fast and unending sequence of tremendous duties on a government technically untrained, not always served honestly and hard-pressed financially: its revenues for 1936 had been only 385,174,561 pesos and for 1937 were 451,110,435. (The exchange rate at the time was 3.60 pesos for 1 U.S. dollar.) There was the duty to finance the *ejidos* (co-operative farm communities) into which the peasants were organized, the duty to direct the peasants in their labours in the fields now that the horse-

riding, whip-in-hand *capataces* (overseers) were abolished, the duty to guide the new owners in marketing their product, the duty to prepare leadership among them, the duty to persuade them to use mechanical appliances, to develop an understanding of sanitation, to feel the need of better housing—all this without regimentation or police constriction, a full test for the democratic ideal. In order to overcome the considerable outcry made both by reactionaries in Mexico and by critical observers abroad the government was put on its mettle to make in the Laguna, immediately, a better showing than private enterprise had ever made. The administration's main efforts centred here in 1937. Discussed and denounced under various aspects, even as a Russian-inspired communistic step bound to result in a fiasco or worse, the Laguna expropriation attracted world-wide attention. In 1938 a group of U.S. educators under the chairmanship of Professor Louis Gottschalk of the history department of the University of Chicago made a social survey of the Laguna. Gottschalk had visited communist farms in Russia. Frankly pessimistic about them, he was not inclined to a different attitude regarding the Laguna region before studying it in the field. At the end of his investigation he understood its peculiarly Mexican nature and he wrote (in the visitors' book of the National Ejido Credit bank): "I came, I saw, I was conquered."

The success achieved in the Laguna by 1938 can be told simply. People who erstwhile had laboured from dawn to nightfall for scant wages, taking their sleep on the bare ground or at best on straw mats, had in two brief years of change risen to the dignity of spring mattresses on bedsteads. House construction was widespread; schools were being built everywhere together with small clinics and a large central hospital; physicians and trained midwives were practising for fixed wages paid by the *ejidos* where none had practised before; a distance away a great dam (inaugurated Oct. 6, 1946, and given the name of President Cárdenas) was being raised to provide through the years an even control of the Nazas river waters. Irrigation ditches were being neatly laid out in a maze; some *ejidos* clung to the use of mules for harrowing and plowing, but these beasts were the best of their kind, imported from Missouri; not a few groups were putting their earnings in tractors and combines, others in electric fixtures for their brand new homes, and every one seemed eager and hopeful. The Torreón newspapers that under the old dispensation had prophesied ruin on the heels of expropriation now printed advertisements offering the "*ejido gentlemen*" (*señores ejidatarios*) choice Canadian and Scotch whiskeys and their ladies Hollywood toiletries. After a few cheerful years, however, the flush of success paled and discontent cropped up in the Laguna.

With profits between 40,000,000 pesos in "bad" and 60,000,000 in "good" years, the Laguna had yielded great wealth to its few former owners. It proved unequal to making over 30,000 families comparably prosperous. The soil there is fertile provided it has water, and water was not always abundant or even sufficient. Here as throughout the country the life of the peasants—roughly 70% of the total population—continued to be hard. But the history of Mexico changed after 1937 from that of a people discouraged with the sense of being forever frustrated to that of a nation unwilling to bear with unnecessary poverty, struggling in freedom, therefore, to overcome handicaps of which it became aware.

The administrative labour alone involved in the land redistribution, with the duties that it imposed on the government during the ten years 1937-46, was staggering

to contemplate. In most instances the *ejidatarios* had no inkling of the nature of credit or its techniques. The credit available for them was pitifully short, the government having to provide it in its entirety at first. Private capital, distrusting the land reform, refused to aid; in fact, even if it had been of a different mind, it had developed no experience along this line. *Ejido* administration systems had to be worked out by trial and error. Credit had to be developed. Innovations were sometimes slow. At the time the Laguna was made over to the peasants, the National Bank of Ejido Credit was operating with a capital of 120,000,000 pesos, financing the needs and actually directing the labour of 2,846 *ejido* societies throughout the country. In the Laguna alone—in 1936 and 1937—257 new societies were formed. In Yucatán, where the land reform was also spectacularly undertaken in 1937 and 1938 by breaking up the vast hemp haciendas, 33 *ejido* credit societies were organized with 46,112 family heads as members. In the Yaqui region of Sonora, 13 *ejido* societies were established with 1,995 members, and in the neighbourhood of Mexicali, in Lower California, just below the United States border, 65 *ejido* societies with 3,902 members were set up. These were the most sensational accomplishments of the Cárdenas administration in carrying out the agrarian revolution, but it was a much greater achievement than these simple figures indicate. Altogether, from Dec. 1, 1934, to Nov. 30, 1940—in the six years of Cárdenas—more than 1,000,000 peasants received land to the extent of 45,350,000 acres and were organized in 10,651 *ejidos*. In the following administration, under President Avila Camacho, that work was continued so that roughly about 1,800,000 peasant families that were landless when the revolution began in 1910 cultivated their own acres at the close of the decade 1937–46.

Avila Camacho took cognizance of the fact that something had to be done to implement the land redistribution. By 1940, production was not what it should have been. The parcels of land, usually no more than five acres of good soil per family, proved too small; under still-primitive methods of cultivation, in most cases, they did not yield enough to abolish poverty in the fields and to provide for the rest of the population. Sometimes under instigation of the expropriated owners, more often moved by discouragement, lawlessness sprang up among the *ejidatarios* themselves, and the less industrious would fall in ravaging bands on the fields of the more thrifty at harvest time. Throughout the decade the insecurity of the countryside was a constant menace to life itself and a deterrent to progress. The marauders were especially the bane of the small individual farmers and discouraged cultivation. Avila Camacho, however, did not heed the voices that would have him revive the strong-hand methods of another day. Although the death penalty—abolished by the revolution in the federal jurisdiction—was decreed as a wartime measure for murders in the open country and highway assaults, it was the deep conviction of Avila Camacho that in most cases the peasants looked askance at the lands given them, failing to improve or even cultivate them, because, besides the insufficiency of the holdings, they were unsure of owning them definitely under the *ejido* setup.

This kind of landholding was very widely discussed in Mexico after its revival by the revolution, especially during the decade 1937–46. It was as old as Mexico itself, dating from Aztec times when all lands were held in common by the tribe or the nation and were periodically redistributed, a parcel to each family. During colonial days, private land ownership as developed in the old world was introduced in Mexico, but the native communities

that were not destroyed by the conquest continued mostly to live under their own ancient system. At the same time the townships chartered by the Spaniards adopted the equally old Spanish custom of setting apart an area outside the town proper (to be found “as you left town,” hence called *exido* in the spelling of the time, literally “exit land” in English) which belonged communally to all the townspeople for pasturing and for fuel wood, corresponding to the commons of old England perpetuated in New England villages. Eventually the idea of the Indian common lands for all uses and that of the more restricted Spanish *ejido* merged, the latter giving its name to the former. How far the Mexican peasants had become individualistic, outgrowing their communal Indian tradition, was a much disputed question with relation to the land reform during the decade. A marked tendency in the direction of individualism was evident. Progress in Mexico, as evinced in the decade and chiefly with reference to land tenure, was oriented toward a growing sense of private ownership tempered by social-mindedness. A certain quality of socialism was inevitable, resulting from the fact that government initiative was under the revolutionary administrations of the decade, and even earlier, the main source of aid and direction.

Under President Avila Camacho there was instituted the registration not only of the *ejido* groups but of their individual members, and the *ejido* allotments were ordered measured off into individual parcels assigned personally to each *ejidatario* to guarantee him against any possibility of being arbitrarily dispossessed. At the close of the decade that task was under way. The main problem of Mexico no longer was land redistribution itself but the means of enlarging the individual parcels, of making these lands more productive and, in short, of advancing modern ways of agriculture. Towards these goals the land reform went forward. Irrigation systems, highways and railways opened or were designed to open new lands for distribution to relieve overcrowded *ejidos* and to increase the number of privately owned small farms. Model farms were set up. The improved cultivation systems introduced in most regions were expected to reduce the number of *ejido* members necessarily bound to the soil, making ready a population to be employed by industry. The course of Mexican history was thus changed more deeply than might be superficially perceived, but the land problem remained fundamental. The Mexican people by and large seemed to have acquired a clear understanding, or at least to have developed a sure instinct, of this change, and from 1939 to the end of 1946, Mexicans of all classes clamoured for the industrialization of the country based on increased agricultural production. To satisfy this demand was one of the main pledges on which Miguel Alemán was elected to succeed Avila Camacho. Meanwhile, the challenge of Mexico's handicaps was fully met.

Handicaps.—The scarcity of water had often spelled tragedy for the people in many regions of Mexico. Rain-fall had been calculated, from an agricultural viewpoint, as “very insufficient” for about 30% of the national territory, just “insufficient” for about 35%, and “sufficient” for the rest, or only a little more than one-third of all the lands in Mexico. “Abundant rainfall,” calculated for 23% of the whole area of the Argentine republic and 47% of that of the United States, is normal for only 13% of the area of Mexico. It is so concentrated in definite regions that it results in disastrous yearly floods, especially in the river basins towards the Gulf. During the decade 1937–46,

President Lázaro Cárdenas proclaiming the expropriation, in March 1938, of the properties of 17 British, American and Dutch oil companies in Mexico, which were then taken over by the national petroleum administration

the Mexican government was very busy constructing dams and irrigation systems, devoting progressively larger portions of its revenues to this item. From 1926, when this development began under Calles, to 1934, when Cárdenas became president, only 51,320,593 pesos had been spent for dams and irrigation projects. During the six-year term of Cárdenas, from 1934 to 1940, 160,319,281 pesos were spent for the purpose; and under Avila Camacho, from 1940 to 1946, the expenditure was enormous by comparison: 150,000,000 pesos in 1945, for instance, and 180,588,778 in 1946. A few flood-control projects were also undertaken, and plans were envisioned for multi-purpose river control. In 1945 and 1946 Miguel Alemán aroused national interest in the example set by the United States through the Tennessee Valley authority.

Another handicap, shortage of electric power, was naturally linked with the limited water projects in Mexico prior to the decade. There were no such obstacles as state rights or the opposition of "vested interests," which in the United States had figured prominently in projects of this kind. In Mexico the difficulties were technical on the one hand and financial on the other. In 1943, a 300,000,000 pesos 10-year plan was formulated which was speeded up as much as possible. Of the Mexican population of 21,000,000, only about 4,000,000 used electricity in any form at the end of the decade—a fact which accounted heavily for the backwardness of the country.

Along with the floods and the scarcity of water, many of the more populated regions of Mexico from time immemorial had been unhealthful. Yellow fever had been eradicated entirely; blackpox was practically banished from great areas of the country; typhus, too, came under certain measure of control; but malaria and intestinal and other infections were still rampant, taking a heavy toll of life during the decade. Both under Cárdenas and Avila Camacho, and as an adjunct to the land reform, a pro-

gram for supplying credit to the poorer communities for sanitation and potable water projects was initiated. A government bank was created for this purpose, a great tropical medicine research centre was established and students of medicine in the various universities of the country were obliged to spend a year in out-of-the-way communities. The federal health department and department of public welfare were joined in a single agency under a secretary of state in 1943 and the work undertaken continued to be co-ordinated with that of the state agencies in a vast network. By 1944, some 700 public health centres were functioning in the country, at a cost of more than 20,000,000 pesos a year, of which sum the central government contributed about 18,000,000; state, municipal and *ejido* treasuries contributed the rest. The manufacture of essential drugs was promoted, under state control, and their free distribution was increased among the poorer communities.

The cumulative effect of all these measures was immediately felt. By 1944, the general mortality rate, which had been 24.56 per 1,000 persons yearly in 1937, fell to 21.50 per 1,000 in 1943 and 18.7 in 1945. Infant mortality in the same period was reduced to 114 per 1,000 children under one year old, as compared with the average of 123.5 deaths per 1,000 children from 1928 to 1942. Health conditions in Mexican ports open to international traffic were maintained at a level internationally recognized as "A."

For centuries, and understandably so on account of its difficult surface, Mexico was a land of inadequate transportation facilities. Under Calles great modern roads were begun. Succeeding administrations carried on that work steadily. In the decade 1937-46, however, more roads were constructed in Mexico than in all its former history. At

the close of 1946 it had a highway system of 12,500 miles, stretching from the United States border at various points down to within only some 50 miles of the Guatemala border, forming a net linking various ports on the Pacific and the Gulf with inland towns and these with each other. Railway construction proceeded meanwhile more slowly but firmly. Rehabilitation of the existing rail lines was needed in order to make more effective Mexico's co-operation in the United States war effort, especially for the transportation of minerals and other strategic materials which Mexico supplied abundantly. The older roads suffered considerably under the strain of war time urgency and accidents were frequent, but not more so than in the United States during the same period. Aviation was almost entirely a development of the decade. Its growth, linked with that of United States aviation, was phenomenal but left promise of greater development. Various lines centering in Mexico City were flying ships northward east and west to the United States daily, east to the West Indies and south to Central America. Aviation fields were laid out everywhere, and national lines carried on an ever heavier passenger and freight traffic within the republic.

Illiteracy was another drawback of such magnitude as to endanger every purpose of the land reform and of the other aims of the revolution. The 1940 census recorded 9,411,075 persons of all ages as illiterate (7,161,109 more than 6 and less than 40 years old). There were 1,237,018 men, women and children who spoke no Spanish but only an Indian language or dialect. The efforts made during the decade to incorporate these people, through elementary education, into the economic as well as the cultural life of the nation were highlighted by the law of Aug. 21, 1944, enacted as a war emergency measure, whereby every citizen who could teach to read and write was enlisted in a National Campaign of the Alphabet. In a little more than two years and at an expenditure of less than 3,000,000 pesos (including the cost of printing 10,000,000 primers and writing tablets which were distributed gratis) almost 1,500,000 persons were given instruction and half their number had passed their examinations by Aug. 1946.

The lack of technicians of all kinds was felt sharply in Mexico. As part of the educational progress made by the country during the decade, a large Polytechnic institute was founded which drew a student body of several thousand young men. Under the direction of an eminent Mexican scientist, Manuel Sandoval Vallarta, formerly of the Massachusetts Technological institute, the new Polytechnic put Mexico in advance of most Latin American countries in scientific training. The National School of Agriculture at Chapingo continued to prepare agronomists and other experts greatly needed to further the land reform. Rural education also made great progress.

Two other aspects or derivations of the agrarian revolution should be more fully considered. First, the land laws as amended during the ten-year period, encouraged private ownership of holdings of not more than 245 acres of the best soil. (Considerably larger areas were allowed for other kinds of land and, over a fixed number of years, for cattle ranches). This was the *pequeña propiedad*. Under Avila Camacho, special measures were taken to insure its inaffectability and to safeguard it from encroachment by land-hungry peasants. It must be noted also that in every case of land expropriation the owner concerned was not entirely deprived; a *pequeña propiedad* was left to him including, in most instances, the manor house and its surrounding buildings. The difference between the *pequeña propiedad* and the *ejido* parcel assigned to an individual owner was that the latter might not be mortgaged or sold

or otherwise conveyed to another owner. Growing security in land tenure led to increased agricultural production, (which, however, remained deficient) and to the flow of private capital into rural credit channels. This development was the second important aspect of the land reform ushering in a new era in Mexican history.

Rural Credit.—Credit under modern systems of banking in Mexico dated only from 1864, when the first Bank of Issue, Circulation and Discount, as it was named, was founded. Prior to that date, money lending followed mediaeval patterns, and large credits had to be sought from foreign sources, which involved the nation in difficulties that at times jeopardized its sovereignty. Other banks followed in due course, but because of their failure to provide the relief sorely needed by agriculture a charter was finally granted in 1901 to the Agricultural Mortgage Bank of Mexico. By 1909, however, when the government investigated the agricultural credit services, not a single institution was found responding to this demand. "Of loan banks," the report said, "they have but the name." Private enterprise failed signally in this field, so government action was sought; but this course was followed timidly. Three of the existing banks joined in forming the *Caja de Préstamos para Obras de Irrigación y Fomento Agrícola* with a capital raised through bond issues which the government guaranteed. Instead of providing loans for irrigation and agricultural promotion works, which its long name indicated, the *Caja* dissipated 81,750,000 pesos for which it was indebted to foreign interests. The records showed that until the decade 1937-46 Mexico carried on, especially in agriculture, without proper credit facilities. For even when, in 1926, a law provided for the collaboration of the federal government, the state governments and private banks in forming the National Bank of Agricultural Credit, 18,000,000 of its initial capital of 20,000,000 pesos had to be supplied by the first of these partners, and about two-thirds of the bank's assets were loaned not to real farmers but to influential individuals who nonchalantly forgot these obligations as a matter of course. General Abelardo L. Rodríguez, the president whom Cárdenas succeeded, informed the congress in 1934 that as the capital of the National Bank of Agricultural Credit was "practically frozen," it had to be given 6,000,000 pesos to carry on. The Cárdenas administration increased that amount to 20,000,000 pesos in 1935. On Dec. 2 of that year the functions of the bank relating to *ejidatarios* were assigned to a new institution, the National Bank of Ejido Credit, with a capital of 120,000,000 pesos provided by the government.

After that reorganization the National Bank of Agricultural Credit was devoted exclusively to the *pequeña propiedad*. During the decade 1937-46 its objective was substantially that expressed in its report for 1944: "We are not and do not aspire to be private bankers. We are conscious that the bank exists precisely to fill all the gaps that private banking ignores. . . . We give a hand to farmers who have not been able to get ahead but who are willing; if in the end we succeed in having them improve their methods, endow their farms well [with equipment] and raise their living standards, that is our best reward, although a part of the loans made remain unrecovered."

The National Bank of Ejido Credit undertook to organize the more reliable *ejidatarios* in credit societies which grew from 3,679 with 308,729 members in 1936 to 5,896 with 451,948 members in 1945. During the decade 1937-46, it advanced credits amounting to a round 1,000,-

000,000 pesos. As its rate of recovery tended more and more to normal it was able, from 1938 on, to operate with private capital which it guaranteed. Its volume of business grew from 24,000,000 pesos in the first year to almost 500,000,000 in 1945. Its methods, however, were ponderously slow, calling for simplification.

After the Oil Expropriation.—(For details of the Mexican oil expropriation, see PETROLEUM.)

In resolving to carry out the agrarian revolution, President Cárdenas had not anticipated such additional difficulties as were brought about by the oil expropriation, which he had not contemplated and had tried to avoid. The six year plan that the National Revolutionary party had drafted as Cárdenas' platform could not be carried out in all details. Yet, in addition to the accomplishments of his administration already mentioned, he succeeded in organizing, under the National Bank of Labour Credit, a state-directed co-operative to operate the Emiliano Zapata sugar factory built at Zacatepec in the sugar cane state of Morelos; the national railways were placed under a workers' management but had later to be returned to government operation; congress approved a law stipulating the responsibility of public officials, designed to enforce honesty in the administration; the Civil Service law made government employees secure in their work and permitted them to unionize. On Aug. 28, 1938, the leagues of agrarian communities that had formed separately in every state and territory of the republic met through delegates and formed the National Peasants confederation (C.N.C.). Labor representatives from various Latin American countries gathered in Mexico City at the invitation of the C.T.M. and founded the Confederation of Workers of Latin America (C.T.A.L.) with Vicente Lombardo Tolezano, of Mexico, as its president. Fraternal delegates from other countries attended the founding ceremonies, including John L. Lewis, of the United States, representing the C.I.O. and Léon Jouhaux, of France, representing the C.G.T. The Mexican government honoured the request made by the president of the United States to admit political refugees in Mexico; this had already been Mexico's policy with reference to Latin American nationals and loyal Spanish republicans.

Altogether, a fine spirit of self-assurance and of assertive democracy pervaded Mexico; under its inspiration the campaign to elect Cárdenas' successor in 1940 was started in 1939. The suggestion that the principle of "No Re-election" be discarded in Cárdenas' favour was turned down, with a will to make real the other half of Mexico's motto—"Effective Suffrage"—stamped on all official documents.

The Cedillo Revolt.—In May 1938, one of the older leaders of the Mexican army, General Saturnino Cedillo, who had also had a career as secretary of agriculture and as governor of the important state of San Luis Potosí, rose in arms in his home grounds, making real the threat of civil war. Mexico stood the test. Public opinion denounced the revolt. President Cárdenas had expressed his desire that there might be no bloodshed during his administration. Repairing to San Luis Potosí, he directed the campaign to corral the rebels and capture them alive. Because of these instructions the rebellion lasted longer than would have been necessary. In the end Cedillo and his escort were unavoidably slain in a skirmish. Cedillo's failure was significant. It showed how deeply the temper of the country was for peace, and the army proved that it was no longer a springboard for ambitious *caudillos* but a reliable force for the support of the country's institutions.

Avila Camacho's Administration.—In 1928, President Calles had expressed the hope that the various revolutionary groups in Mexico might unite for political action. In 1928–29 there was organized at Querétaro the National Revolutionary party (P.N.R.) as the amalgamation Calles desired, appointing him *Jefe Máximo* of the revolution. It was this party that elected Lázaro Cárdenas in 1934. Now, towards the end of his term, Cárdenas called on the P.N.R., which had disowned Calles, to complete its democratization by broadening its base. From a union of political groups the P.N.R. became in 1939 a union of "social forces," the coalition of four "sectors"—labour, peasant, military and popular or middle class. The labour and peasant sectors, represented chiefly by the C.T.M. and the C.N.C., thus became components of the P.R.M. or Party of the Mexican Revolution as the reorganized P.N.R. was named. When both these sectors came out for the nomination of General Manuel Avila Camacho, most aspirants withdrew; but one of them, General Juan Andreu Almazán, formed a party of his own for the occasion—the *Partido Revolucionario de Unificación Nacional* (P.R.U.N.)—and led the opposition to the P.R.M. A number of smaller parties sprang up overnight, the law allowing their formation, and eventually a Coalition of Independent Parties was formed, with the P.R.U.N. for centre, which looked formidable on paper. When after the elections the various leaders of this grouping cast at one another charges of "betrayal," the entire setup collapsed definitely.

The electoral law called for the designation, by the municipal authorities, of polling places conveniently located. The first five citizens arriving at each place were supposed to form a board to supervise the voting. The aim of the law was perfection in democracy, but it resulted in numerous clashes for control of the boards. Considerably more than 2,000,000 voters turned out on election day; some 40 died and a few hundred were injured, counting the casualties suffered by both sides engaged in the contest. But there was no question in Mexico that Avila Camacho had won by an overwhelming majority on July 7, 1940. He had campaigned on a platform of great dignity, calling for the strengthening of the democratic freedoms and for national unity in face of the serious world situation. He had come out squarely for the solidarity of the Americas and had had occasion, in referring to the existing differences with the United States, to say that Mexico trusted in the efficacy of the good neighbour policy and in the integrity of President Franklin D. Roosevelt. When he was inaugurated president on Dec. 1 of that year, a brilliant gathering of special envoys from all the American republics, including vice-president-elect Henry A. Wallace of the United States, attended the ceremonies.

Almazán found it hard to reconcile himself with defeat. For a time after the election he seemed to believe in the possibility of a successful revolt. Discovering, however, that his "friends" had duped him, and publicly denouncing them, Almazán asked to be allowed to return to Mexico peacefully to retrieve the losses his fortune had suffered. He repatriated himself a few days before Avila Camacho's inauguration, and wrote a book.

Manuel Avila Camacho was born to a middle-class village family in Teziutlán, a town of Puebla high up among the mountains of that state, a centre for the active agricultural life of the region. He had begun to study accountancy, looking forward to a business career, when the revolution swept him away in its ranks in 1914. A year later he served as secretary to the first land redistribution agency in Puebla. Back in the army, he was never to leave military service until called to lead the P.R.M. While

Miguel Alemán on a tour of rural Mexican areas before his election to the presidency in July 1946. He is shown hearing a peasant woman of Zacualco state her case for the town's need of an improved water supply

still a colonel he won distinction during one of the uprisings that Alvaro Obregón had to crush, by refusing to accept his release on condition that he would quit the federal army. The alternative to that choice was facing a firing squad. Avila Camacho made arrangements for the safety of the officers under him, then declared himself ready for execution. His valour evoked the admiration of the rebels, who let him go unconditionally free. President Obregón raised his rank and had his loyalty cited on three consecutive orders of the day, a unique honour. Afterwards, under President Calles, Avila Camacho was sent to the state of Jalisco to put down a religious rebellion. He sized up the situation correctly. Instead of seeking to exterminate the rebels, he persuaded them that the revolution had no quarrel with religion, and met with success as a peacemaker. Later, as chief clerk, undersecretary and secretary of the war department successively in President Cárdenas' cabinet, Avila Camacho rose to the highest rank in the army and devoted great efforts to inculcate in the services a conscious understanding of the democratic ideal.

As candidate of the P.R.M., he won this party to the policy of co-operation instead of the class struggle. "Nothing," he said, "could be more harmful to the program of the revolution than to fail to understand in its fullness that, having saved man in our country from organized exploitation, the urgent task before us now is to save him from the oppression of poverty." This was on Oct. 29, 1939. "The class struggle," he further explained, "exists and should exist, but we must wage it under the law, resolved to find a way for class collaboration, unless we

wish to return to a condition of permanent poverty and cycles of violence and tyranny." Two attempts against his life were made during his term of office, which he confronted with a forgiving mind. In his farewell address to the congress he was able to say: "We exerted ourselves to overcome and eliminate the cult of violence. Even at the risk of having the manfulness of our purpose mistaken for weakness, between punishment and tolerance we chose tolerance, between forgiveness and anger we chose forgiveness."

As president he enforced the constitutional provisions which forbade the army as such to engage in political activities. The army sector of the P.R.M. was abolished. He promoted the amendment of article 3 of the constitution dealing with education, which had been a bitter issue for years. The new wording of this article tended to undo the notion that education under Mexican law was based on antireligious instruction. At his bidding the C.T.M. joined with employers' representatives in a pact of honour to keep strikes at a minimum during the war emergency. The labour-employer conflicts which had become frequent under Cárdenas when labour, assured of the friendliness of the administration, "felt its oats," now became exceptional. In 1942 and 1943, out of 775 major disputes, only 8 resulted in strikes and these were soon resolved. A department of the navy under a cabinet member was created, and the army and the aviation service were reorganized to make possible Mexico's determination to patrol its long littorals and be in a position to repel any invasion without need of United States forces such as were stationed in several Latin American republics. Permission, however, was granted for United States aviation units flying over Mexico to and from the Panama canal defenses to use

Mexican airfields, which were laid out at strategic points and fully equipped to provide efficient service. The six living former presidents of Mexico—three civilians (Adolfo de la Huerta, Emilio Portes Gil and Pascual Ortiz Rubio) and three generals (Plutarco Elías Calles, Abelardo L. Rodríguez and Lázaro Cárdenas)—rallied about Avila Camacho. Their coming together was dramatic. Calles' health did not permit him to rejoin the army, but Cárdenas was placed in charge of the Pacific coast defense area and later headed the department of national defense. To Rodríguez was entrusted the Gulf coast defense. By all these tokens national unity became a demonstrable fact. It was a united Mexico that accepted the challenge of war.

Foreign Policy.—Internally, Mexico prepared for war by concord between capital and labour, without infringement on the rights of either; by harmony among revolutionary leaders who had been estranged; by the achievement of peace on the issue of religious freedom, and by placing its armed forces on a war footing. Externally, Mexico strengthened its relations with the governments of the countries fighting the axis. Having resumed relations with Great Britain, Mexico recognized the various governments in exile established in London. President Avila Camacho received the visit of Premier Wladyslaw Sikorsky of the Polish government and agreed with him to extend Mexican hospitality to several thousand Polish refugees evacuated from the U.S.S.R. after June 21, 1941. These unfortunates, including several hundred orphans, remained in Mexico until 1946 under the joint care of the governments of Poland and the United States. Mexico had broken relations with the U.S.S.R. on Jan. 22, 1930, not brooking soviet interference in Mexican internal affairs; when Russia went to war with Germany and became an ally of Mexico, these relations were resumed on Nov. 19, 1942. But the heart of the foreign policy of Mexico was inter-American solidarity. To this great purpose Mexico bent its every energy. It was not the policy of a single individual, or of a government department or of the government itself alone but of the country as such, in keeping with the unbroken tradition to which Mexico had been faithful in every stage of its history as an independent state.

The government implemented the popular will. It was a policy resulting from Mexico's weakness as a nation, from its jealous sense of sovereignty often at stake, and from the perils it had encountered in a world largely ruled by force. Out of all this Mexico had deepened its conviction that no country should be allowed to interfere in the life of another country; that no territorial conquest by strength of arms or skulduggery could be valid; and that all freedom loving nations, especially those of the American hemisphere, should bind themselves firmly to defend these tenets. At the Havana Conference of the American Republics, in 1928, Mexico had taken up the cudgels for non-intervention as a principle of international law for the Americas. In the development of the good neighbour policy declared by President Franklin D. Roosevelt, Mexico's position was tacitly accepted by the United States. The formal agreement between the American nations reached at Montevideo, Uruguay, in 1933, outlawing intervention, was universally regarded as a Mexican triumph. Consistent with these principles, Mexico voiced at the League of Nations its refusal to recognize the conquest of Manchuria by Japan, the conquest of Ethiopia by Italy or the various capitulations under which Germany dominated Austria and other countries. In the case of Spain, Mexico's course was guided by principle to the exclusion of expediency in

any form. Mexico gave not only moral support to the legitimate government of Spain but supplied it to the fullest extent of its possibilities with Mexican-made armament. After the defeat of the Spanish loyalist armies, Mexico tendered a welcome to several thousand Spanish refugees, and in Aug. 17, 1945, gave official hospitality to the Spanish cortes which nine days later set up in Mexico City a government with which Mexico carried on friendly relations. Save only on the Spanish question Mexican policy did not differ sharply during the war years with the policy of the United States, not from compulsion of the stronger on the weaker country but from a common devotion to the freedom of all peoples and a common concept of democracy.

In inter-American matters during the decade, the United States often followed Mexican leadership, so many of the initiatives discussed and finally approved in inter-American official gatherings were of Mexican origin and not novel, but part and parcel of Mexican foreign policy in decades past. The outstanding position of Mexico began to be asserted in the 1933 Pan American conference at Montevideo and in the 1936 conference in Buenos Aires, Argentina. It was confirmed in the Lima conference in 1938, in the Panamá consultation of 1939 and in the Havana consultation of July 1940, all held during the term in office of President Cárdenas. Under Avila Camacho, Mexico consistently furthered the policy of welding inter-American solidarity—in the Jan. 1942 consultation at Rio de Janeiro, Brazil, where it pledged agreement with the Atlantic charter, and, finally, at the Chapultepec conference, held in Mexico City in Jan. 1945, where a charter for the Americas was drawn. Later, when Uruguay proposed a policy of collective intervention to be adopted by the American republics, the state department in Washington appeared to be in agreement with the idea but the majority of the other republics, notably Mexico, rejected it. Throughout the difficulties with the Argentine republic in 1945 and 1946 Mexico, too, maintained strict non-intervention and frequently expressed its conviction that Argentina would not fail to ratify the Chapultepec charter subscribing voluntarily to the principle that the solidarity of the Americas was indivisible.

In the early years of World War II, Mexico maintained a position of neutrality, strictly in accordance with international law. As a passive but significant protest, however, it withdrew its diplomatic missions and closed its consular offices in those countries that had been subjugated by the axis powers. German consulates in Mexico were ordered closed by President Avila Camacho. Under international regulations Mexico, on April 8, 1941, seized the German and Italian ships that had taken refuge in Mexican ports. On Oct. 31 of the same year Mexico joined the effort of Chile in seeking to have Germany recognize the moral law in respect of hostages. In protest against nazi brutality Mexico gave the name of Lidice to the pretty village of San Jerónimo on the outskirts of Mexico City. When Pearl Harbor was attacked, Mexico acted immediately on the commitment it had voluntarily made at Lima, Panamá and Havana; it severed relations with Japan on Dec. 8, with Italy and Germany on Dec. 11, and shortly thereafter with the governments of the countries that had sided with the axis.

Mexico at War.—Co-operation with the nations that were eventually to form the United Nations group, and especially with the United States, was vigorously promoted.

On Nov. 19, 1941 a Claims convention was concluded between the two countries, bringing to an amicable close a series of long negotiations on expropriations. Mex-

ico agreed to pay to the United States \$40,000,000, in annuities of no less than \$2,500,000 each, in cancellation of all claims of American nationals against Mexico for lands expropriated and for other causes—not including the oil companies' compensation and a few other matters left pending. The United States agreed to grant Mexico a special \$40,000,000 credit with the Export-Import bank in Washington for the stabilization of the Mexican peso, pegged at 4.85 pesos to the dollar, and for other uses, including the payment of the resolved claims. Mexico, however, had no need to draw on this credit. Further, on the same date, the United States treasury agreed to purchase Mexican silver up to 6,000,000 ounces monthly. These agreements and the numerous other friendly acts that followed cleared the atmosphere in which the two countries moved in a common purpose.

There was hardly an agency of the Mexican government that did not share in the co-operation between the two nations. Legal measures were taken to define acts against the national security (*delitos de disolución social*) and to establish penalties for such acts, outlawing and punishing fifth-column activities. The registration of all aliens was ordered, and the country was carefully combed to discover those who were illegally in Mexico and those who, having entered legally, were nevertheless undesirable guests. Registration of naturalized citizens was also ordered, and their records were scrutinized. By these measures a number of German agents who had fled from Canada and the United States and had arrived from Central and South America, as well as nationals of other countries in the service of the axis, were caught and dealt with according to law. An immigration station was established in the ancient castle of Perote, on the highway from Puebla to Jalapa, where such aliens as were to be deported were detained. These included the crews of axis ships seized. Later the Italians had to be segregated from the Germans in another similar station. All nationals of axis and pro-axis countries were removed from border zones and the seaboard, and ordered to report periodically to the authorities. The border with the United States was especially guarded against axis activity. No naturalization papers were permitted to be taken out by nationals of Germany, Italy, Japan, Bulgaria, Hungary or Rumania, no matter how long they had resided in the country. Telegraphic and radio communications were placed under government control. On the other hand, all British subjects were allowed entrance to Mexico on the same footing as nationals of the American countries. On Dec. 27, 1941, Mexico decreed that the American nations at war were not subject to the stringencies applying to belligerents, and the same privilege was later extended to non-American nations at war with the axis. A general permit was issued for vessels of all democratic nations at war, including their hydroplanes, to drop anchor or alight on national waters and ports. On March 27, 1942, an agreement was signed whereby Mexico acquired from the United States military equipment under lend-lease. Meanwhile, Mexican production of strategic metals and other material needed for the U.S. war effort was speeded tremendously.

United States agencies gave special grants to U.S.-owned mining concerns in Mexico to improve their equipment. All restrictions on the importation of Mexican oil were removed by the United States. On April 29, 1942, the production and prices of Mexican metals and metaloids came under a special agreement with the Metals Reserve company, the chief United States purchasing agency abroad. In January the Mexican-American Joint Defense commission had been established and, later, the Inter-American

Defense board, agreed on at the Rio de Janeiro consultation of the American republics, was set up, a ringing notice to the effect that Mexico would not brook any challenge to its rights.

When on May 13, 1942, the Mexican tanker "Potrero del Llano" was sunken treacherously by an unidentified submarine, and the "Faja de Oro" met the same fate a few days later in Gulf waters, popular clamour in Mexico voiced the indignation of an offended nation. The Mexican government through adequate conducts demanded satisfaction but obtained none from Germany, Italy and Japan. Thereupon the congress authorized the president of the republic to decree a state of war with those powers, as of May 22, 1942. On June 14, that year, Mexico signed in Washington the declaration of the United Nations of Jan. 1, 1942, committing itself not to sign a separate peace or agree to an armistice with the axis.

The shortage of farm hands and railway track workers in the United States, caused by the flow of manpower into the armed services and into the more highly paid war production jobs, made it imperative for various American allies to send their nationals to relieve that situation. Mexico responded generously, and under an agreement signed Aug. 4, 1942, Mexican volunteer farm hands were selected and dispatched to the United States. By Aug. 31, 1943, some 75,000 Mexicans had been enlisted for this work; a year later the enlistments were 113,431; in 1945 the maximum was reached, 139,688. In 1946, the need being still acute in the United States, some 30,000 to 40,000 *braceros*, as these workers were called, were supplied.

In Nov. 1942, an agreement was reached between the two governments for the operation in Mexico of a United States commission to aid in the work of railway rehabilitation, chiefly for improvement of the transportation of Mexican minerals, produced in huge volume. The commission was empowered to employ a special fund in this work, part of which consisted in taking Mexican railway workers to railway centres and repair shops in the United States for special instruction in U.S. "know-how." The Export-Import bank in Washington gave Mexico a \$30,000,000 credit for highway and railway construction and rehabilitation. In other fields, Mexican-U.S. co-operation proceeded on a level never reached before. On July 1, 1944, a plan was agreed on between Mexico and the United States for war time co-ordination of sanitary efforts, the United States contributing \$2,500,000. The Rockefeller foundation continued throughout the decade to lend valuable assistance in many ways, and other American institutions of like purpose extended their work to include co-operation with Mexico in promoting improved health services.

More important was the spirit shown during the war and postwar years for the satisfactory solution of problems pending between the two countries. On Nov. 2, 1942, an agreement was arrived at with the International Committee of Bankers, in New York, for the readjustment of the foreign debt of Mexico and the payment of its principal and interest. The total nominal value of the Mexican debt in arrears—\$274,669,277 principal and \$278,884,248 interest as of Dec. 2, 1942—was reduced to 230,631,974 pesos capital and a little over \$2,000,000 interest. On Feb. 20, 1945, another agreement was arrived at, with the same International Committee of Bankers, for settlement of the railway indebtedness of Mexico; the principal and interest in arrears were reduced from \$557,604,382 to an estimated total of 244,971,707 pesos.

In 1944 a treaty was concluded resolving the distribution between Mexico and the United States of the waters of the Colorado and Tihuana rivers on the west coast and of the Rio Grande from Fort Quitman, Texas, to its mouth on the Gulf.

The treaty was publicly discussed in both countries and was finally ratified with certain amendments by the United States senate and by the senate of Mexico.

Following President Roosevelt's visit to President Avila Camacho, at Monterrey, Mexico, on April 20, 1943, which gave vivid testimony to the spirit of friendliness between the two countries, a Mexican-American Commission for Economic Co-operation was established, which met in Mexico City and in Washington, and evolved ways and means to relieve Mexico's shortage of imports. Industrialization projects to cost an estimated 1,915,000,000 pesos were studied by this commission. Meanwhile, Mexico had established a National Financing (N.F.) corporation which, as reorganized in Dec. 1940, was designed to promote and finance the establishment of concerns for production (especially in lines that were less attractive to private enterprise), to create a national stock exchange and to act as the government's financial agent. From Jan. 1 to Aug. 31, 1946, this corporation provided capital for investments amounting in round numbers to 472,000,000 pesos. The N.F. obtained from the Export-Import bank in Washington various credits totalling \$63,000,000, which permitted the acquisition of industrial machinery by Mexico without recourse to a reduction of dollar reserves of the Bank of Mexico.

By a special covenant Mexico was authorized to recruit for its armed services nationals of the United States within its borders, and the United States likewise to enlist in its armed forces Mexican nationals within its territory (excluding *braceros* and bona fide students in U.S. schools), and a special registry of such recruits and a record of their service was agreed to be exchanged by the two countries. As of July 30, 1945, more than 15,000 Mexican nationals (not including, of course, United States citizens of Mexican origin) had served in the U.S. forces and had suffered 1,492 casualties.

Some won the congressional medal. By similar agreements several hundred Mexicans served with the British and French forces.

Mexico's chief responsibility, however, lay in keep-

ing in readiness to defend its territory, and all approaches to the United States, from invasion. National prestige, however demanded that the Mexican flag should be carried into battle overseas, and a Mexican Expeditionary Air force, consisting of squadron 201 of the Mexican aviation corps, received final training in the United States and was sent to the Pacific to co-operate with the United States air forces against Japan. This select contingent of Mexican eaglets was fully representative of the Mexican army as modernized during the decade. It bore itself with honour and its flag was placed, alongside the beloved flags of famous Mexican regiments that defended Mexico against old-time foes, in the Museum of National History in Chapultepec castle.

The feeling predominant among Mexicans during the war was that it was peculiarly their war. They took pride in the fact that great nations were proclaiming and fighting for principles which Mexicans had proclaimed and fought for throughout their history.

Especially, it was for Mexicans a vindication of their revolution.

The 1946 Elections.—In 1939, the tourist trade recovered from the drop it had suffered in 1938, registering 139,010 visitors to Mexico. This number increased to 173,104 in 1941 and kept up at that level in the following years of the decade. In 1945, tourist expenditures in Mexico were

estimated at more than 180,000,000 pesos annually. After 1939, capital which had migrated from Mexico sharply reversed its trend and began to pour into the country to escape war restrictions abroad. This avalanche dislocated Mexican finances, creating in the country a class of wealthy refugees and expatriates sufficiently numerous to affect the economy of the country. Mexican exports, too, far exceeded the imports, and the trade balance in international commerce inclined overheavily to the Mexican side, producing an excess of circulation in the country, with resultant inflation. The cost of living went up by leaps and bounds. Black markets galore flourished beyond possible restraint by ordinary methods. The building trades prospered and real estate values soared. But production of food staples suffered considerably, and the prices of these commodities reached dizzy heights. Mexico had to import large quantities of maize, rice, sugar and other articles of consumption. To the more pessimistic observers it seemed as if the agrarian revolution, after all, had been unavailing to give the country an evenly distributed prosperity. Facile moralists preached alarming warnings signifying nothing more than that the hard-hit middle and lower classes were restless and critical. Labour now felt free to strike for higher wages, in a mood similar to that exhibited in the United States.

Under such conditions the political campaign to elect Avila Camacho's successor was started when, on June 1, 1945, Miguel Alemán resigned as secretary of *Gobernación* to accept the call made on him by numerous workers' organizations throughout the country to run for president.

Alemán chose to campaign on a program for the industrialization of Mexico based on increased agricultural production and the regional development of electric power possibilities. As the campaign developed, he had to contend with only one major opponent, his former fellow member in the cabinet, Ezequiel Padilla, a lawyer, former secretary of education, congressman, senator of the republic and, under Avila Camacho, secretary of foreign relations, internationally renowned as an orator. Padilla chose to make the revolution the chief issue of the campaign. The elections were held peaceably on July 7, 1946, under a reformed electoral law whereby the secret ballot was fully guaranteed.

In Jan. 1946 the P.R.M. had held a national convention which first resolved to change the nature of the party from the coalition of "sectors" already described to an institution open to all citizens accepting its program; the Institutional Revolutionary party (P.R.I.), as it was now named, then proceeded to nominate Miguel Alemán and to adopt as its platform the program he had elaborated in the course of a vigorous campaign.

On Sept. 12, 1946, the congress declared him president elect. On Sept. 22 this declaration was made solemnly throughout the republic, and on Sept. 21 the state department in Washington announced that President Truman had appointed Ambassador Walter C. Thurston to represent him at the inauguration ceremonies on Dec. 1, 1946, in Mexico City.

Mexico City

Mexico City, the capital and largest city of the republic of Mexico, is located in the federal district, which is distinct from but almost surrounded by the state of Mexico. Population was estimated in 1945 to be 1,464,556. The census of 1940 credited Mexico City with a population of 1,448,422. The federal district, the other localities of which can for practical purposes be considered almost as suburbs of Mexico City, had a population of more than 2,000,000 (1,757,530, 1940 pop.). Mexico City is the oldest large metropolis in the hemisphere; unlike Buenos Aires, Rio de Janeiro, Lima and other important Latin American cities, and all those in the United States, it was an important pre-Columbian center, named Tenochtitlán. The historical and civic centre of the city is the Zócalo, a great plaza on which front the national palace, the cathedral and other important buildings. The cathedral is reputed to be the largest church edifice in North America. The older part of the city is east of the Zócalo, but is a relatively poor and obscure quarter. The principal business district is between the Zócalo and the Alameda (an extensive park), while residential building has spread from the Paseo de la Reforma district westward beyond Chapultepec Park to Chapultepec Heights. The decade 1937-46 saw an extensive development of workingmen's housing on the south side of the city. The renowned Chapultepec Park, crowned by the castle of the same name (occupied by Maximilian and Carlotta in the mid-1860s) is one of the show places of the city. Mexico City is the location of the National University of Mexico and many other prominent educational institutions.

Mexico City was the national centre of huge demonstrations in March 1938 expressing popular approval of the government's action in expropriating foreign oil interests. Minor disturbances occurred in the city during the presidential campaign in 1940 in which the major candidates were Gen. Manuel Avila Camacho (the winner) and Gen. Juan Andreu Almazán. Nabor Carillo, a prominent engineer, in an address to the national physical conference on May 8, 1943, predicted that Mexico City would sink into the earth unless remedial measures were taken promptly. He had reference to the fact that the city is located in large part on the lakebed of a large but shallow lake, not drained until long after the Spanish conquest. The insecure geologic foundation led to much settling of large structures. Municipal authorities in May 1944 bought a large electric floating fountain originally built for delivery to Rumania. Mexico City was the location in Feb.-March 1945 of the Inter-American Conference on Problems of War and Peace which, in the "Act of Chapultepec," laid down the bases for postwar hemispheric security. Police Chief Ramón Jiménez Delgado on May 15, 1945, reported the disappearance of a sum estimated at \$21,000,000 from the police fund.

Numerous disorders occurred in Mexico City during the presidential campaign in 1946 between Miguel Alemán and Ezequiel Padilla. (R. H. FN.)

156 Meyer, Eugene

Meyer (1875-), U.S. publisher, banker and government official, was born Oct. 31, 1875, in Los Angeles. He was graduated from the University of California with a B.A. degree in 1895 and then studied finance and languages in Europe. On his return to the United States, he entered the banking field and organized the firm of Eugene Meyer, Jr., and company; he was its head from 1901 to 1917.

After the U.S. entered World War I in 1917, Meyer entered federal service as adviser on nonferrous metals to the Advisory Commission of the Council of National Defense and subsequently held this position with the War Industries board. In the succeeding years, he held the following posts: member of the National Committee on War Savings (1917), director and managing director of the War Finance corporation (appointed by Pres. Woodrow Wilson in 1918, and reappointed by Presidents Harding and Coolidge); member of the Federal Farm Loan board and Farm Loan commissioner (1927-29); governor of the Federal Reserve Bank (1930-33); and first chairman of the Board of the Reconstruction Finance corporation (1932).

In 1933, Meyer left the government service and bought the *Washington Post*. Six years after he took over the newspaper, its circulation tripled and it was regarded as one of the more prosperous and influential dailies in the east.

On June 4, 1946, Meyer was appointed first president of the International Bank for Reconstruction and Development. He resigned Dec. 4, 1946, declaring that he had accepted the post with the understanding that he would remain only until the bank was launched.

Mica

World production of mica is shown in Table I; in many cases the figures include some scrap and in some cases, especially the United States and Canada, represent more scrap than sheet. Hence, the data were not accurate as indications of production of the strategic grades of mica—block, sheet, films and splittings.

As may readily be seen from the data in Table II,

the United States remained dependent on imports for the bulk of its supply, and not even the more than ten-fold wartime increases in price resulted in much improvement in the situation, even though the domestic output was more than doubled.

India supplied most of the U.S. imports of splittings and the largest share of sheet mica, with smaller amounts from Brazil, Canada, Argentina and Madagascar. With the drop in war demand Brazil took the lead in sheet mica, but India continued its supremacy in splittings.

India remained the world's largest producer of block and sheet mica, and with its abundant supply of raw material and of cheap labour, produced the bulk of the world's supply of splittings.

As the source of mica nearest the United States, the Canadian deposits more than trebled their output during World War II, but the figures shown in Table I include considerable proportions of scrap. For example, in the peak year, 1945, of the total output of 4,025 short tons, 3,033 tons were scrap and waste leaving 992 tons of the strategic grades.

Although Madagascar was an important prewar source of mica, operations there were restricted by war conditions, and production declined by half. As the only other sources of appreciable amounts in the western hemisphere, Brazil and Argentina expanded operations, especially the former.

(G. A. Ro.)

Micará, Clemente

Cardinal Micarà (1879-), archbishop of Apamea in Syria and apostolic nuncio to Belgium and internuncio to Luxembourg, was born at Frascati, Italy, on Dec. 24, 1879. As a young priest he entered the corps of papal diplomats, shortly reaching the rank of nuncio. Named nuncio to Belgium and internuncio to Luxembourg in 1923, he became dean of all apostolic nuncios. Following the German occupation of Belgium in 1940, Archbishop Micarà was expelled, together with other diplomats, and returned to Rome, where he remained throughout the World War II period, engaging in special work with the secretariat. He joined the Belgium exile government at London in the summer of 1944, and returned to Brussels after the liberation of the country. Pope Pius XII proclaimed him cardinal on Feb. 18, 1946.

Michael, King of Rumania

See MIHAI.

Michigan

One of the north central group of states, Michigan was the 26th state admitted to the union; popularly known as the "Wolverine state." Area 97,940 sq.mi. (including 39,960 sq.mi. of Great Lakes water surface); population (1940) 5,256,106; (estimate, Jan. 1, 1946, 6,100,000). Of the state's population in 1940, 3,454,867 were urban, 1,801,239 rural. Whites composed 95.9% of the population, nonwhites 4.1%; of the whites, 81.93% were

native-born, 18.07% foreign-born. Capital, Lansing (78,753). Larger cities were Detroit (1,623,452); Grand Rapids (164,292); Flint (151,543); Saginaw (82,794).

Shortly after his inauguration on Jan. 1, 1937, Governor Frank Murphy was faced with the responsibility of formulating a policy for meeting the most serious industrial crisis in the state's history. The sit-down strike begun in January at the Flint plant of the Fisher Body company, spread rapidly to other units of the General Motors corporation and took 140,000 employees away from their work. With Governor Murphy as mediator, a settlement of the strike was negotiated 44 days after its beginning. Strikes which broke out in March in other large automobile plants were similarly settled in April, but in the meantime the movement had begun to spread to other industries. The summer months witnessed an intensive struggle between C.I.O. organizers and the Ford Motor company; at the end of the year the latter was in conflict with the National Labor Relations board.

The state legislature in 1937 had a Democratic majority in the house and the members of the senate were closely divided along party lines. Significant enactments included laws placing the entire state government under civil service; requiring applicants for marriage licences to furnish certificates of freedom from venereal diseases; raising the standards for applicants to practise healing; effecting the consolidation under a single executive of prisons, probation and parole activities; consolidating the administration of various state institutions for the mentally ill; establishing the secret primary; making more effective collections under the sales tax; revising the state banking laws; liberalizing requirements for old age assistance.

In Aug. 1938 Governor Murphy called an extra session of the legislature to secure funds to meet relief demands. In the brief session, nine measures were passed, the three most important appropriating \$10,000,000 additional relief funds, amending the housing laws to extend to all cities and incorporated villages the privileges of receiving aid from the federal government, and extending the moratorium on mortgages and land contracts. The many changes inaugurated by the Murphy administration inspired peculiar interest in the Nov. 1938 election. Particularly acrimonious was the struggle for the gubernatorial nomination between Frank D. Fitzgerald and Harry S. Toy on the Republican side. With Fitzgerald's victory in the primary, a spirited campaign ensued between him and Governor Murphy, the principal issues of which were the handling of the sit-down strikes of 1937, the spending program of the Murphy administration, and in general, the "Little New Deal" in Michigan.

The election was decisive in outcome: the entire Republican ticket was swept into office. Fitzgerald received a plurality of more than 93,000 and Luren D. Dickinson, 79-year-old Republican, whose long career had already included six terms as lieutenant governor, was returned to office. Harry F. Kelly was elected secretary of state; Miller Dunckel, state treasurer; Vernon J. Brown, auditor; Thomas Read, attorney general. The Republicans also won 23 of the 32 senate seats and 75 of the 100 seats in the house. Upon expiration of his term, Governor Murphy was appointed by President Roosevelt to be attorney general of the U.S. By referendum the voters ratified a constitutional amendment restricting gasoline and motor vehicle licence plate taxes to street and highway uses and rejected three other proposed amendments.

It became evident early in 1939 that the Republicans planned sweeping changes with respect to economic and

social policies inaugurated by the Murphy regime as well as in the civil service program. Almost immediately, however, the Fitzgerald administration was embarrassed by widespread publicity given to the opening of numerous gambling establishments in the state. Governor Fitzgerald died, after a brief illness, on March 16, 1939 and Luren D. Dickinson became the state's 54th governor. Seventy-nine-year-old Dickinson, an active leader of the Anti-Saloon league, entered upon a vigorous campaign against sin as he saw it, which made him the most talked about governor in the state's history. Political observers were impressed with the uniformly large audience attending the Sunday religious rallies addressed by the governor in various parts of the state.

The legislature, in a session lasting until the middle of June 1939, passed nearly 370 measures. Perhaps the most important was a new civil service bill, which aroused bitter opposition from the Michigan Merit System association and other organizations. The measure removed from civil service about half the 16,000 positions which had been under the system at the beginning of the year. An oil control act drafted by the department of conservation was described by R. A. Smith, state geologist, as the best legislation of its kind in the nation. Other acts required an oath of allegiance of teachers, instructors and professors; provided for the raising of standards for nurses; abolished the legislative council established in 1933.

In the Nov. 1940 election, Wendell L. Willkie received 1,039,917 votes for the presidency and Roosevelt received 1,032,991. Murray D. Van Wagoner, Democratic nominee for governor, defeated Dickinson by 131,291 votes, marking the fifth instance in as many successive elections where the governorship passed from one major party to the other. Other choices were: lieutenant governor, Frank Murphy; secretary of state, Harry F. Kelly; attorney general, Herbert J. Rushton; treasurer, Theodore I. Fry; auditor general, Vernon J. Brown. The election returned strong Republican majorities in both houses of the legislature. A proposed constitutional amendment to liberalize the existing 15 mill limitation on assessments for school purposes failed of adoption; a civil service amendment providing for a broad merit system was adopted; a proposal for broader taxation of Detroit motor bus service outside the city was rejected; a proposal for strict regulation of dental advertising was adopted.

In the 1941 legislative session a deadlock occurred when the Republicans discovered, as they were preparing to adjourn in July, that they could not muster the necessary two-thirds vote to override any of 33 vetoes of the Democratic governor. The legislature then adjourned in recess for three months. When it reconvened in October, peace was negotiated with the governor, the Republicans being allowed to override 11 appropriation vetoes while the governor got his way on all policy-making vetoes. Laws were enacted providing for consolidation of most of the revenue-collecting departments, re-enacting regulations for milk-price fixing, implementing new constitutional amendments to provide "clean election" machinery, liberalizing the unemployment compensation act and making industrial sabotage a felony. In all, 382 laws were enacted; 116 were given immediate effect and 55 were added to that number when the legislature reconvened in October. However, the state supreme court ruled that in taking the latter step the legislature had exceeded its authority.

In the election of Nov. 1942 Judge Homer Ferguson (Rep.) defeated Senator Prentiss M. Brown (Dem.) for

U.S. senator. Gerald L. K. Smith, who ran as an "Independent Republican" candidate, polled only a few thousand votes. Michigan voters again chose to restore the governorship to the party in opposition: Harry F. Kelly (Rep.) defeated Gov. Murray D. Van Wagoner (Dem.). The Republicans obtained the election of their entire party slate. Dr. Eugene C. Keyes was elected lieutenant governor; Herman H. Dignan, secretary of state; Herbert J. Rushton, attorney general; Vernon J. Brown, auditor general; D. Hale Brake, treasurer. In the contest for justice of the state supreme court, Raymond W. Starr, incumbent, defeated Earl C. Pugsley (Rep.). With Republicans winning 25 of the 32 seats in the senate, and 73 of the 100 seats in the house, the position of the Democrats was left very weak—a condition intensified by Governor Van Wagoner's withdrawal from leadership in state politics.

An important industrial development in 1942 was the conversion of the huge automobile industry to war production. Existing facilities were utilized and a marked extension of resources occurred, the most conspicuous example being the opening of the Ford bomber plant at Willow Run. Thousands of state residents and out-of-state workers poured into Michigan manufacturing centres. According to U.S. census bureau estimates, the Detroit area by May 1, 1942 had a population of 2,750,000—an increase of 336,000 from the 1940 figure. The increase created acute housing problems, with numerous trailer and small-house communities springing up.

The 1943 session of the legislature, which met from Jan. to March, passed 265 measures, 9 of which were vetoed by Governor Kelly. Appropriations totalled \$137,000,000; a six-member state commission of labour and industry was created; for the first time since 1925, seats in the house were reapportioned; a new compilation of Michigan statutes were ordered; the Michigan council of defense was abolished and the direction of its system was transferred to a director of civilian defense (Capt. Donald S. Leonard); and for the first time in 30 years, the workmen's compensation law was revised. Governor Kelly's program for "streamlining" the government was deferred, but considerable authority for consolidating state agencies was entrusted to the newly created department of business administration headed by Robert S. Ford.

War production continued to play a dominant role in Michigan history in 1943. Population congestion was a contributing factor in bringing on the most significant event in 1943: the race riot which broke out in Detroit on June 20. Charges of corruption in the state legislature led to the initiation of a one-man grand jury investigation under the direction of Judge L. W. Carr. Republican candidates were uniformly successful in the April election: R. Spencer Bishop and Ralph A. Hayward were chosen regents of the state university; Eugene B. Elliott, superintendent of public instruction; Charles M. Ziegler, highway commissioner; Neil E. Reid and Emerson R. Boyles, supreme court justices.

A special session of the legislature was convened on Jan. 31, 1944: 15 members were under indictment of a special grand jury on charges of graft. Legislation for youth guidance included measures providing for the payment of full-time state salaries to county agents in counties with 30,000 or more residents and for revision of the juvenile code. For veterans the legislature set up a veterans' affairs bureau, provided for an educational and rehabilitation program, revised the unemployment insurance act,

and set up a \$1,000,000 veterans' reserve fund. For the postwar period, \$9,115,000 was appropriated for construction and repair of state-owned buildings. A war ballot bill was enacted, and the compulsory school attendance requirement was extended by one year. The grand jury investigation of the legislature continued; by the end of the year more than 50 men, a considerable number of legislators among them, had been named in its warrants; 20 had been convicted.

In the Nov. 1944 election, President Roosevelt carried Michigan by 22,476 votes, despite the fact that his opponent, Thomas E. Dewey, was a native son. This result was more conspicuous because all of the Republican candidates on the state ticket won by wide margins—Governor Harry F. Kelly won by a margin of 219,654, to become the first governor in 14 years to win immediate re-election. Other state officers were: lieutenant governor, Vernon J. Brown; secretary of state, Herman H. Dignan; attorney general, John R. Dethmers; treasurer, D. Hale Brake; auditor general, John D. Morrison. Republicans won 64 of the 100 seats in the house, 25 of the 32 seats in the senate; they won 11 of the 17 places in congress.

The regular 1945 session of the legislature convened at the beginning of the year and adjourned on April 26. Republican strength was reduced by three by the resignation of one member charged with graft, the murder of another and the failure of the third to occupy his seat, following conviction on the charge of conspiring to buy and sell votes. A total of 381 measures was passed. An annual budget of \$162,500,000 was adopted; new or increased taxes were placed on whisky, on bank accounts and other intangible property and on horse racing; a department of mental health was created; a Youth Guidance commission and a state department of aeronautics were established. A constitutional amendment to allow state participation in control of rivers and lake levels was adopted. Late in 1945 the governor called the legislature into special session (to meet in Jan. 1946), to deal particularly with the state's building program.

During the closing weeks of 1945, public attention throughout the country was concentrated on the huge strike in the General Motors plants (Detroit, Flint, Pontiac, Lansing, Grand Rapids and other cities). Other automobile plants also experienced production difficulties; total automobile production in Michigan during the year was less than 15% of that anticipated in early fall. In the spring election, Justices Raymond W. Starr and Walter H. North were elected to succeed themselves, as members of the supreme court; Charles M. Ziegler was re-elected state highway commissioner; Eugene B. Elliott, superintendent of public instruction. Total state revenues for 1944-45 were the highest in history, amounting to \$258,232,442. The combined surplus on June 30 was \$79,034,932. The state's wealth was revealed by the fact that with only 3.2% of the population of the United States, its federal tax load was nearly 6% of that levied in the country.

In a four-way contest in the primary election on June 18, 1946, Kim Sigler, formerly a Democrat, received approximately 38% of the votes cast for the Republican nomination to the office of governor, having a plurality of 48,000 votes over his nearest rival. In the Republican nominating convention a few weeks later, Sigler presented for nomination to the four administrative offices to be filled, a slate

Willow Run, Michigan, showing the huge bomber plant built by the Ford Motor company in 1941-42. The plant was converted to the production of automobiles and agricultural machinery after the close of World War II

including the name of but one of the incumbents. The other incumbents, all candidates for renomination, were rejected in the triumph of the Sigler slate.

In the election of Nov. 5, 1946, Sigler defeated the

Democratic nominee, former-Governor Murray D. Van Wagoner, by a plurality of more than 350,000 votes—the largest ever accorded a Michigan governor in a nonpresidential year. The entire Republican state ticket was swept into office. Eugene C. Keyes became lieutenant governor; Fred M. Alger, secretary of state; Eugene F. Black, attorney general; D. Hale Brake was re-elected state treasurer; Murl K. Aten became auditor general.

Three proposed amendments to the state constitution were ratified by the voters in the election. A proposal that one-third of the sales tax levy should go to local governments and school districts carried by a 64 margin. By a slightly smaller margin, the voters granted a veterans' bonus providing for a maximum payment of \$500, based on \$10 monthly for domestic and \$15 monthly for overseas service between Sept. 16, 1940 and June 30, 1946. Nearly 70% of the voters approved of a proposal to permit the state to engage in the development of harbours of refuge, airports, drainage and other internal improvements.

Adoption of this amendment permitted the release of \$1,000,000 held by the state in escrow for airport building; this money was to be matched by federal funds.

Midway Islands

Midway consists of two small islands, Sand and Eastern, plus numerous islets, surrounded by a coral reef five miles in diameter; these islands comprise 850 and 328 ac. respectively.

Captain N. C. Brooks in the Hawaiian bark "Gambia" was presumably the first to discover these islands, on July 5, 1859. Captain Brooks, finding no native population, took possession of the islands in the name of the United States and named them Brooks Islands. However, it was not until 1867 that the United States government made formal claim. At that time the name was changed to Midway, designating the mid-position of the islands between the United States and Japan. In 1869, an initial congressional appropriation was made to improve the harbour at Midway, but the project was later abandoned as too costly.

For many years thereafter, only slight attention was given to Midway. In 1903 it was declared a U.S. naval reservation by President Roosevelt and placed under the secretary of the navy for purposes of administration. In the same year Midway was made a connecting point for the cable lines being laid from Hawaii to the Philippines.

It was not until the advent of air transportation that the real significance of Midway was appreciated. In 1935 the islands became a regular stop over point for commercial transpacific flights.

It was World War II, however, which conclusively demonstrated the strategic importance of Midway. The possession of these tiny islands formed a very important part of the strategy of the Japanese forces. It was recognized that if Midway could be utilized as a Japanese out-

Black smoke rising from a burning oil tank on Midway during the Japanese attack of June 1942

post, not only could Hawaii, only 1,100 mi. to the southeast, be made untenable for the United States forces, but the all-important supply lines to Australia could be cut off, thereby permitting the uninterrupted conquest by the Japanese of Australia and the islands of the south and southwest Pacific.

Two serious attempts were made by the Japanese to capture Midway. The first effort was on the evening of Dec. 7, 1941, when the attacking forces were repulsed with severe losses after a heavy engagement. The second attack, which culminated in the great battle of Midway, in June 1942, marked a turning point in the war in the Pacific.

Battle of Midway, 1942.—The battle of Midway began on the morning of June 3, 1942, when a considerable Japanese force was sighted several hundred miles southwest of Midway following an easterly course. The composition of the force was not determined immediately, but it was clearly a large attack force with supporting vessels. Late in the afternoon of that day this force was bombed by a squadron of B-17s. While the results of the attack were not definitely determined, hits on several ships were scored. On the morning of June 4, contact was made with Japanese aircraft headed toward Midway, and immediately thereafter, two carriers and the main Japanese forces were sighted in the same vicinity. The Japanese air attack force was subjected to heavy fire and the Japanese plane losses were considerable. Meanwhile, army, navy and

marine corps planes from Midway attacked the Japanese carriers, battleships and other vessels in the invading force, inflicting serious damage to one carrier.

At this point, United States carriers took a hand in the engagement. The famous Torpedo Eight squadron from the "Hornet" attacked a force of four Japanese carriers. This squadron was without the protection of fighters, and without accompanying dive bombers. All the planes were shot down and only one pilot survived, but the squadron made several hits on the Japanese carriers.

About an hour later, torpedo squadrons from the "Enterprise" and "Yorktown" attacked the same carriers, and also suffered losses, but registered hits on two carriers. These attacks were followed by dive bombers from the "Enterprise" which smothered two carriers. In the meantime, more bombers from the "Yorktown" had hit a third carrier, a cruiser and a battleship. Two carriers had been set on fire and put completely out of action. A third was damaged and was later sunk by the submarine "Nautilus."

Planes from the only Japanese carrier remaining undamaged attacked the "Yorktown," and although this attack force was annihilated, it succeeded in making three bomb hits. Shortly afterward, Japanese torpedo planes scored two hits on the "Yorktown" and orders were given to abandon ship. About two hours later planes from the "Enterprise" attacked the undamaged Japanese carrier and left it a mass of flames. Immediately thereafter, when a squadron from the "Hornet" arrived, the carrier was blazing so furiously that it was possible to concentrate on a nearby battleship and a cruiser, both of which were hit.

At this stage of the engagement, it was apparent that control of the air had been won by the American forces. Other U.S. planes scored hits on a battleship, a damaged carrier and a destroyer. By the end of the day the Japanese were in full retirement.

On the morning of June 5, aircraft from the "Enterprise" and the "Hornet" made an ineffective attack on a Japanese light cruiser, but planes from Midway discovered two Japanese cruisers, one of which was left in a crippled condition. Poor visibility prevented further operations.

On June 6 "Hornet" planes located a Japanese force consisting of two heavy cruisers and three destroyers and made hits on the two cruisers. Planes from the "Enterprise" also scored hits on those two cruisers and later in the day "Hornet" planes successfully attacked two more cruisers and a destroyer.

On the same day, in an effort to save the "Yorktown," which had been taken in tow, the destroyer "Hammann" went alongside to put on board a salvage party. While she was alongside, the "Yorktown" was struck by two torpedoes and the "Hammann" by one. The "Hammann" sank within a few minutes and the next morning the "Yorktown" also sank.

The battle of Midway was the first decisive defeat suffered by the Japanese navy since 1592, when Korean Admiral Yi-sun administered a resounding defeat to the Japanese Admiral Hideyoshi, so-called father of the Japanese navy, off the Korean coast. It also put an end to the long period of Japanese offensive action and restored the balance of naval power in the Pacific. From that time forward the initiative was taken by the United States forces. 162 Mihai (Michael)

King Mihai I of Rumania (1921–), was born at Sinaia on Oct. 25, 1921. He first ascended the throne in 1927 under a regency when his grandfather, King Ferdinand, died; Carol, his father and the heir apparent, had renounced the right of succession because of his affection for the commoner, Magda Lupescu. In 1930 Carol recanted this decision, however, and returned to Bucharest to be crowned. Mihai again became king on Sept. 6, 1940, when Premier Ion Antonescu forced Carol to vacate the throne after a disastrous summer in which Rumania lost most of the territory ceded to it after World War I. Princess Helen, Mihai's mother and Carol's former wife, returned to Bucharest, and even the Iron Guard endorsed the transfer of the crown. Under Mihai's reign, Rumania signed the anti-Comintern pact with Germany in Nov. 1940, and declared war against the soviet union the following year. The long period of German occupation eventually led to an anti-axis movement, with which the king was known to sympathize. On Aug. 23, 1944, with Russian troops entering Rumania, Mihai officially broke with the axis, overthrew the government of Premier Antonescu, and announced restoration of the liberal constitution. He signed the armistice with the United Nations on Sept. 13, 1944.

Mikhailovitch, Draja

Mikhailovitch (1893–1946), Yugoslav soldier, was born at Shumadija, near Belgrade. He fought in the Balkan War (1912–13) and in World War I, in which he was thrice wounded, decorated for bravery and was promoted to a captaincy. He then attended the higher military academy and the general staff school.

Following Germany's conquest of Yugoslavia in April 1941, Mikhailovitch fled to the mountains, where he welded Yugoslav resistance elements into a strong guerrilla army. His initial operations against the axis were successful, and he was made minister of war by the Yugoslav government-in-exile. In early 1943, however, Mikhailovitch apparently restricted his operations, and his Chetnik followers clashed frequently with the Yugoslav partisans, a rival organization headed by Marshal Josip Broz (Tito). In the ensuing battle for political control of Yugoslavia, Tito won Allied support. Under British pressure, King Peter himself was forced to disavow Mikhailovitch and announced (May 20, 1944) his removal as minister of war. After the war, Mikhailovitch went into hiding, but was captured in a mountain cave on March 13, 1946, by Yugoslav authorities and was held for trial on charges of treason and collaboration with the axis. During his trial, which opened June 10 in Belgrade, Mikhailovitch admitted some charges that he personally collaborated with the axis, but later retracted this admission, saying that he had been too exhausted by the severe grilling to know what he was saying. After a lengthy trial, he was found guilty (July 15) and together with eight other Yugoslavs was executed in Belgrade by a firing squad on July 17, 1946.

Miklas, Wilhelm

Miklas (1872–), Austrian politician, was born on Oct. 15, 1872, at Krems. Educated at Vienna university, he became a teacher and later headmaster of Horn public school. In 1907 he was elected to parliament as a Christian-Socialist. He was state secretary for education in 1919 and president of the national council in 1923. In 1928 he

was elected president of the republic and was re-elected in 1931. By inviting Engelbert Dollfuss to form a ministry in 1932, he unwittingly ushered a semidictatorship into Austria. When Dollfuss was murdered by nazis in 1934, Miklas acquiesced in the arrangement whereby Kurt von Schuschnigg took over the government. In Feb. 1938, with Italian support of Austrian independence withdrawn, and under duress from Germany, President Miklas reluctantly signed the Austro-German agreement which gave control of the police to the Austrian nazi minister of interior, Arthur Seyss-Inquart. Early in March, following the plebiscite proposal and an angry ultimatum from the German government, President Miklas, yielding to what he described as "brute force," dismissed Schuschnigg as chancellor and appointed in his stead the German protege, Seyss-Inquart. On March 13, the occupation of Austria by German troops having been completed, President Miklas resigned at the request of Seyss-Inquart.

Mikolajczyk, Stanislaw

Mikolajczyk (1901–), Polish politician, was born in Gelsenkirchen, Germany, the son of a farm labourer who emigrated from Poznan province in western Poland to find work in the Westphalian mines. After the family returned to Poland, Mikolajczyk became active in political organizations. He was wounded during the Russo-Polish war in 1920. After the war, he entered politics and at the age of 29 was elected to the Polish parliament, the Sejm, where he served from 1930 to 1935. He was vice-president of the anti-German Polish Peasant party and was made its president in 1937. When the nazis invaded Poland in Sept. 1939, he saw military action in the unsuccessful defense of Warsaw. He fled to Hungary and later escaped to France. He became President Paderewski's deputy in the Polish parliament-in-exile, and succeeded to the presidency on Paderewski's death in 1941. When Premier Wladyslaw Sikorski was killed in a plane crash in July 1943, Mikolajczyk became premier. He sought a settlement of the Polish boundary dispute with the soviet union, and in 1944 conferred in Moscow with Premier Stalin on this issue. Mikolajczyk's efforts to achieve a settlement were futile, and he resigned on Nov. 24, 1944. Accepting the invitation of soviet leaders in Moscow to help in the reorganization of the Polish cabinet in accordance with the Yalta agreements, he joined the new Warsaw government as deputy premier on June 23, 1945. Mikolajczyk later accused the government of suppressing the Peasant party and fostering a one-party dictatorship.

Milch, Erhard

Milch (1892–), German soldier, was born at Wilhelmshaven on March 30, 1892. He studied at Danzig Technical high school and Koenigsberg university. During World War I he became an army pilot and was advanced to flight general. After the war he became a commercial pilot. He had long been a friend of Goering, and when the nazis came into power in 1933 Milch was made secretary of state in the air ministry. In this capacity he founded the Air Sport league and the Hitler Flying Youth. In 1935 he began the task of building Germany's embryonic air force into an armada of fighting planes. Putting his faith in mass output, Milch confined production to only a few standardized models and was thus able to procure thousands of planes in less than five years. Promoted to colonel general in 1938, he was created field marshal by Adolf Hitler on July 19, 1940. He was also chairman of the Deutsche Lufthansa, Germany's national air line. In Nov. 1942 he was appointed a member of the war

Military Academy, U.S.

From 1937 to the end of 1941 there were no radical changes at the U.S. Military academy, West Point, N.Y., though the academic and military courses continued to undergo the customary minor alterations necessary to keep them abreast of progress.

The attack on Pearl Harbor was immediately reflected in planning, looking toward greater demands that might be made in order to increase the military academy's contribution to the war effort. The academic board, with the advice and assistance of a board of consultants consisting of civilian educators and experienced army officers, drew up a condensed, three-year curriculum. Plans for air corps branch training, early graduations and more intensified tactical training were prepared. By foresight, the academy was ready to put the demands of the war department in effect without confusion or delay.

The following are some of the changes and accomplishments of the war years from 1942 to 1945: The authorized strength of the corps of cadets was raised from 1,960 to 2,496. Two classes were graduated early, and the course was reduced from four to three years. Stewart field and three auxiliary flying fields were developed, and the necessary facilities constructed, so as to carry out the plan for air corps training at West Point. During the war 825 cadets were graduated with their pilots' wings. A large training and manoeuvre area, known as Camp Simon Bolivar Buckner, was developed near by and utilized to provide practical exercises in mechanized and amphibious warfare. Joint manoeuvres with a wartime division at Pine Camp, N.Y., were conducted at the end of each summer. Academic work was also intensified. Regular officers were released to combat units as far as possible, and instructors to replace them were selected from retired, reserve, national guard and specially commissioned officers. Academic work was intensified. German and Portuguese were added to the French and Spanish already taught. By June of 1945, the wartime academy had graduated 2,624 officers.

In Sept. 1945 reversion to a four-year curriculum was announced. As before, a board of consultants was called in to advise. Transition courses were put into effect immediately, but complete conversion could not be accomplished until the 1946-47 academic year. The new curriculum placed increased emphasis on cultural subjects and embodied the lessons learned during the war. The course in modern languages was further augmented by Russian. A course in geography and a more thorough study of international relations and the economics of war were provided. Electronics, communications and nuclear physics were more adequately covered. Military psychology and development of leadership were stressed. Close liaison with the naval academy was emphasized, and joint amphibious manoeuvres with the midshipmen were planned for the summer of 1946.

Military Medicine

Extensive use of blood and blood substitutes, advances in the sulfonamides and penicillin, improved means of protection against disease-bearing insects, development of new techniques in surgery and revision and modernization of organization in the collection and evacuation of casualties were among the significant advances in military medicine which crowded the decade 1937-46.

Liberal use of blood and blood substitutes probably did more to save life during World War II than any other single factor, since loss of blood, unless promptly arrested, quickly leads to death. Tourniquets and bandages had reduced the hazards of haemorrhage somewhat, but until 1940, when blood plasma was first employed on a large scale, loss of blood and shock were the primary causes of death in wars. From the experience gained during the Spanish Civil War it was evident that large stores of plasma would be needed for future hostilities. Special centres were established in different countries by the Red Cross or civilian medical agencies. The public was asked to go to designated places and give blood. Cities established blood donor centres, while rural and small urban communities were served by automobile caravans that acted as mobile donor centres. The numerous accounts of the beneficial effects of blood plasma testified to its life-saving value.

After severe loss of blood, however, recovery was found to be much more rapid when whole blood was given. By 1945, means were perfected to have whole blood available in limited quantities for use on the battle fronts. About 1,000 pints of group "o" blood, the universal type, were procured from blood donor centres at Boston, New York and Washington daily for use at the European fronts. Blood was drawn, typed, processed and flown to special centres behind the lines. Various preservatives were employed so that whole blood could be safely used without fear of transfusion reaction 18 days after it was taken from the donor. Special cartons enabled suitable refrigeration in the flight across the ocean. Free and ready use of blood and blood plasma were significant reasons for the reduction of deaths from wounds from 8% in World War I to less than 3% in World War II.

Use of Sulfa Drugs.—Sulfonamides (the sulfa drugs) played an important part in the treatment of wounds and diseases. Most war wounds were infected wounds, since fighting involved intimate contact with the earth or was associated with debris, fragments or clothing which contaminated wounds. Early administration of one of the sulfonamides was an effective means of reducing the extent and severity of injuries. First-aid packets were prepared with sulfanilamide and sulfathiazole to be sprinkled over the open wounds. Careful studies by the National Research council showed that "frosting" wounds with a sulfonamide did little to promote wound healing, while taking sulfathiazole or sulfadiazine by mouth was of real value in preventing the spread of an infected wound and in promoting healing. Significant reduction was noted in the

mortality from pneumococcus pneumonias after the use of adequate amounts of sulfadiazine. During World War I the death rate from all forms of pneumonia was 28%, while in World War II it was 0.7%. Meningococcus meningitis was a serious disease in World War I, with an incidence of 1.3 per 1,000 per annum in the U.S. army and a mortality of 34%. During World War II the admission rate fell to 0.9 per 1,000 and the mortality to 4%. There was no evidence that the disease was less severe in World War II, but the effectiveness of sulfadiazine was amply demonstrated. Certain upper respiratory infections were curtailed by the use of small amounts of sulfadiazine. Special studies made both in large army and navy installations showed conclusively the beneficial effects of small prophylactic doses of the sulfonamides during the winter season. Sulfonamides reduced noneffective rates among troops and lessened the recurrences of rheumatic fever.

Penicillin and Streptomycin.—Antibiotics were even newer healing agents. Penicillin (*Penicillium notatum*), an extract of a common mould, was used in a wide variety of conditions. It prevents growth of bacteria, especially in all coccal infections, such as osteomyelitis, infected wounds, burns, meningitis, pneumonia and endocarditis. Gas gangrene was also benefitted by the use of penicillin, and Clostridia infections in World War II were relatively few compared to earlier wars. Venereal diseases, long the scourge of armies, did much less damage following the use of sulfonamides and penicillin. Injections of penicillin brought about astounding results in cases of acute gonorrhoea. Those who were not cured in a single course of treatment were given a second course with great improvement. Syphilis was also treated by rapid methods with penicillin. Complications of venereal diseases which formerly caused prolonged hospital care or treatment were rarely observed after extensive employment of sulfonamides and penicillin in acute infections.

Streptomycin, another antibiotic, is a substance obtained from soil micro-organisms. It was found of value in bacterial infections, including pneumococcus pneumonia, Friedländer bacillus pneumonia, beta streptococcus septicaemias and infections with *Escherichia coli* and staphylococci.

Modern preventive medicine made it possible to send U.S. troops all over the globe without fear of undue losses from infections and tropical diseases. A detailed program of inoculations and immunizations was drawn up by the army and navy. Soon after induction into the army of the United States, each soldier was given a smallpox vaccination and injections that protected against typhoid fever, tetanus and paratyphoid A and B. Prior to the soldier's departure for overseas duty and depending upon the area of service, he was inoculated with material which protected him from cholera, plague, yellow fever and typhus fever.

Typhus Fever.—Typhus fever, an aftermath of wars and famines, was a potential threat to the health of Allied armies during World War II. Two main types were encountered—epidemic typhus, spread by the louse (*Pediculus humanus*) and found in the Mediterranean region and elsewhere, and endemic or murine typhus, spread by rats and rat fleas and found mainly in the South and Southwest Pacific areas. Before the fall of Naples it was known that epidemic typhus was present among the civilian population of Italy. In 1943 the United States of America Typhus commission was created to study means of preventing and curing the disease. Immediately after the

Allied armies entered Naples the U.S.A. Typhus commission, in co-operation with the Rockefeller Foundation Health commission, Allied military governments and the medical departments of the army, navy and public health service, undertook a vigorous program to stamp out typhus fever. The epidemic was controlled within several weeks, and there were less than 50 cases in the U.S. army personnel, with no deaths. Improved vaccines were of some help in the protection of immunized soldiers.

Previous aerial bombardment of Rome had driven the civilian population to seek shelter in air raid refuges where the disease spread quickly. Crowding, lack of bathing and laundry facilities combined to make it easy for the body lice to go from person to person, thus spreading the disease.

All acutely ill patients were sent to hospitals promptly and delousing of the rest of the population was begun. A hand-operated spray gun was found to be most effective. The active insecticide DDT (dichloro-diphenyl-trichloroethane) was mixed with talcum powder and inserted in the cylinder of the duster. A long nozzle made it possible to dust all parts of the body where lice usually reside and made the operation of the hand spray so easy that about 20 persons could be treated with 1 lb. of DDT. The average field worker could delouse 200 to 400 persons per day after a system had been established. The entire population was dusted so that the body lice were killed, and the epidemic promptly stopped.

Para-aminobenzoic acid was reported to be of some value in the treatment of louse-borne typhus fever.

Scrub typhus (tsutsugamushi fever), a condition similar to typhus though a distinct disease, was a problem in the orient. It was spread by the chigger or mite of the family of Trombicula which passed the infected Rickettsiae. In New Guinea, Burma and elsewhere in the orient the mites seemed to be associated with the tall kunai grass fields bordering streams and water courses in the jungle. Infection among troops usually took place during the first four to six weeks after a unit occupied a camp site. Careful selection of camp sites, cutting and burning of kunai grass with oil and preparation of the ground by advance units equipped with leggings and specially impregnated clothing which repelled chiggers were effective means of reducing the incidence of scrub typhus among soldiers. Sprays of DDT and other insect repellents were useful in killing the infected mites. Sleeping on the ground was reduced to the minimum, and cots were provided whenever possible in an effort to avoid contact with chiggers. Floors for tents, barracks and hospitals were raised three to four feet above the ground and thoroughly sprayed with DDT to minimize infection. Soldiers exposed to a mite bite were instructed to take a bath at once with thorough soaping and scrubbing of the skin with a rough towel.

Malaria.—Malaria was a serious problem to military surgeons throughout World War II. The conquest of malaria was achieved largely through the extensive use of DDT, sanitation and use of atabrine and quinine. Among troops stationed in regions where malaria was widespread, this disease was often the most common cause of death and illness. Control depended upon the region, the military situation and the availability of men and supplies for anti-malarial measures. In fixed installations reliance was mainly on improved sanitary engineering. Drainage was established, underbrush cut from the banks of streams or lakes and all small accumulations of water filled or regularly oiled or sprayed. In certain tropical island bases, these measures were so effective that there was a nearly

complete eradication of mosquitoes. Screening and bed nets were also important means of reducing malaria.

Favourable situations made it possible to spray an area with DDT by aeroplane prior to military operations and thus reduce the occurrence of malaria among front line troops. A solution of 5% DDT in medium fuel oil sprayed at the rate of 0.3 to 0.6 lb. DDT per ac. gave excellent results. Adult and larval forms of mosquitoes were controlled by the fuel oil DDT mixtures. Sprays of kerosene with 5% DDT were also found useful in hand and power sprayers as additional means of reducing the breeding of mosquitoes.

Considerable stress was given to individual protective measures against malaria. Soldiers and sailors received intensive group instruction regarding the means of transmission of the disease, dangers commonly encountered, use of the freon bomb and the value of taking small daily doses of atabrine. A combination of wearing protective clothing, daily spraying of bunks, proper use of mosquito nets and prophylactic dose of atabrine resulted in remarkable reduction of malaria even among units engaged in combat.

The control of disease-laden mosquitoes was so effective that many tropical diseases which were formerly hazards became of inconsequential importance during World War II. Dengue fever, transmitted by *Aedes* mosquitoes, sand-fly fever or pappataci fever, transmitted by *Phlebotomus papatasi*, and filariasis, transmitted by *Wuchereria bancrofti*, were fairly well controlled by DDT and sanitary measures. Soldiers who did contract filariasis were returned home to prevent reinfection.

Atabrine was required to be taken by all troops stationed in areas considered malarious. Usually 0.1 to 0.2 grams were given daily, and this treatment held the number of cases of malaria to a fraction of the number that would have occurred had no medicine been given. Limited quantities of quinine were available to the Allies during World War II, and it was used by persons who could not tolerate atabrine or in severe cerebral forms of malaria. Experience showed atabrine to be a safe, effective means of preventing certain forms of malaria.

Infectious Hepatitis.—Infectious hepatitis, which caused considerable disability among troops, had been demonstrated to be a virus disease and was believed by some to be transmitted by water. Patients with the disease excreted the virus in their stools, and it was suggested that contamination of the water supply followed. Treatment of water containing the virus with chlorine did not inactivate the disease-producing agent. Studies were made to ascertain practical methods of completely inactivating the virus, and indications suggested that a modification of existing methods of water purification would be required to complete the task.

Infectious hepatitis was encountered in troops stationed in various parts of the world. Many cases were reported from Italy and the Philippine Islands. The disease was easily recognized when medical officers were on the alert for it. Early gastrointestinal symptoms, such as nausea, belching, gas and pain, were part of the initial symptoms. Vague pains throughout the body and fever completed the clinical picture. High carbohydrate diet, complete bed rest and transfusion of matched blood from donors who had recovered from the disease did much to reduce its seriousness. Intramuscular injections of gamma globulin were found to be useful in prevention.

Surgical Advances.—Medical advances were responsible for improved methods of treating war wounds and reducing death and sickness rates. Early and careful *débride-*

ment—that is, careful surgical trimming of the edges of wounds to remove all dead or infected tissues—was found helpful in many instances. An evacuation hospital near the front in the Southwest Pacific had the opportunity to compare the results of débrided wounds with those not trimmed. Forward medical officers carefully débrided wounds early, dressed them, gave the patients sulfa drugs by mouth and immobilized the wounded parts prior to evacuation. The wounded arrived at the evacuation hospital in good condition and made an early convalescence, despite the fact that many had been on lean rations for weeks and had been through an active campaign involving arduous physical exertion.

A second group of patients was treated at forward medical units by sulfanilamide dusting. Wounds were cleansed and crystals of sulfanilamide were sprinkled over the wounds which were then covered with sterile dressings. Upon arrival at the evacuation hospital many of the patients had fevers of 102° to 104° F. More than half of the patients required extensive *débridement* at the evacuation hospital. It was felt that early and careful trimming of the wound edges was of distinct value in promoting the earliest possible healing in that theatre of war.

Immobilization of wounded parts played an important part in healing war wounds. Years before Dr. H. Winnett Orr had pointed out the value of the closed plaster of Paris casts in fixing the injured parts and facilitating early healing. During the Spanish Civil War, Major Josep Trueta used the technique of early suture and closed plaster of Paris casts with excellent results. Pain, shock and delayed healing were avoided by proper fixation of the injured parts. The method was found applicable to fractured bones and large muscle and skin wounds. Plaster of Paris casts enabled hospital corpsmen, orderlies and litter bearers to move and evacuate patients easily to rear areas. Patients with primary suture,—early closure of fresh wounds by catgut or silk sutures,—had to be carefully watched for signs of infection. Casts were frequently split three to five days after they were applied so that the surgeon could inspect the wound. When patients had fevers of 101° F., casts were opened and the wound drained.

Experience during World War II varied in regard to primary suture. Only a limited number of cases were suitable for closure by this method. *Débridement* was found necessary in most wounded patients, and closed plaster of Paris casts were not generally employed. Changes in the types of wounds were accountable for the difference in treatment compared to older methods. During the American Civil War (1861–65) about 90% of wounds were caused by bullets, during World War I about 35%, and during World War II only 20%; 80% were caused by high explosives, fragments, mines, artillery or mortar shells. Modern high explosive shells or fragments inflicted a great amount of cellular and molecular damage to tissues. The impact of the projectile often sent waves that imparted damage to distant regions or organs. It took four to five days before the tissues regained their vitality from the shock or blast of the projectile. For this reason, many wounds were left open for nearly a week after *débridement*. After that, and provided the wounds were clean, they were closed by suture and healed promptly. Some small wounds were carefully trimmed, closed by primary suture and healed promptly without infection.

Burns were of grave concern to the military surgeon, since warfare had been mechanized and fighting took place

near gasoline, fuel oil and kerosene. Naval vessels, aeroplanes and tanks carried stores of high octane gasoline, fuel oil and other inflammable material. The U.S. navy found that sailors were less severely burned when they wore clothing than when stripped to the waist. Specially impregnated clothing which resisted fire was developed, and fire fighting and rescue squads were issued asbestos clothing. A flash cream was used that would protect against the ill effects of temperatures of 3,000° F. for very short periods. The cream was applied to the face, hands and exposed parts of the body before the man went into action. Actual burns were treated by giving enough blood plasma to prevent changes in the circulating plasma, by morphine to overcome shock and by application of a bland sterile ointment to cover the wound. Strong agents such as tannic acid, picric acid and potassium permanganate were discarded early in the war. Scrupulous attention to aseptic handling of burns was responsible for a reduction in the number of infected wounds. Some advocated sterile petrolatum; others cod liver oil ointment. However, the real success in the treatment of burns followed meticulous sterile technique in dressing burns rather than being dependent on the type of ointment employed. Patients with severe burns or burns of the face and hands were treated in forward hospitals until they could be evacuated to rear zones. Plastic surgery centres were established where ugly scars were removed and facial appearances restored. The slow and painstaking efforts of the plastic surgeons in many of the centres produced almost miraculous results for the badly burned soldier or sailor.

Injuries to nerves were encountered quite frequently during the war. The extensive use of land mines by the Germans led to many serious wounds of the arms and legs with nerve damage. Surgeons attempted early nerve suture in clean wounds with some success. Infected wounds had to be débrided, treated with penicillin or sulfa drugs by mouth before the damaged nerve ends could be sutured. Very fine tantalum wire and "nerve glue" (plasma acacia) were found to be helpful agents in joining severed nerve ends together. At times nerve grafts (a section of nerve tissue from elsewhere in the body) were employed in an attempt to overcome the disability.

Reconditioning Program.—A reconditioning program of calisthenics was instituted by the U.S. army to accelerate the return of wounded soldiers to duty. Group participation was possible by having trained physical instructors give exercises to patients in wards. Every effort was made to keep the man in the best possible physical condition in order to reduce the amount of training needed after he left the hospital. Educational and emotional reconditioning followed closely the physical reconditioning. Convalescence was reduced in many instances under this reconditioning program in contrast to the older method of having the patient idle in bed until he was ready for discharge. All training was prescribed by the ward medical officer, who supervised the amount and kind of training. Patients with a fever or some aggravation of their illness were promptly taken from the reconditioning program and treated by rest and other appropriate measures until they were able to resume the training.

When soldiers had made sufficient progress, they were moved from the hospital wards to barracks on the hospital grounds. Their hospital clothes were taken from them and they were given their military uniforms. They were called trainees—not hospital patients—as a further indication of

the new viewpoint. A graduated system of calisthenics, drills, games and military training followed. Convalescence was remarkably shortened—in some instances cut in half—and valuable, well-trained men were quickly restored to military duty or civilian occupations.

Rehabilitation of the deaf and blind necessitated special care. The deafened were sent to hospitals designated as special centers. A convalescent camp at Old Farms, Conn., was used to teach the blind how to walk down streets, climb stairs, get in and out of vehicles and other phases of normal living.

Collection and Evacuation of Casualties.—An efficient system of the collection and evacuation of casualties in amphibious operations was a noteworthy advance of military medicine during World War II. Large-scale landing operations in Europe, Italy, southern France, New Guinea, the Philippines, Okinawa and other Pacific islands helped develop an efficient practical method of evacuation. Assault troops had attached medical personnel to give initial treatment to the wounded and prepare them for evacuation. Field medical personnel followed the assault units during the landings and set up aid stations as near the front as circumstances would allow but in areas that afforded the maximum shelter and safety. Only limited amounts of medical supplies were taken, about as much as the medical department soldiers could easily carry. Later, as the beach was secured, amphibious vehicles made delivery directly to the shore supply depot.

Wounded were evacuated from aid stations to clearing or collecting units as rapidly as the situation would permit.

Extensive use of motor vehicles reduced the arduous task of carrying patients by litter to a minimum and accelerated the evacuation of the wounded to hospitals. Field motor ambulances proved their worth on all battle fronts. The newly designed "jeep" was quickly converted to a small ambulance by the addition of an adjustable frame that made it possible to carry two litter patients. Jeeps were driven as far forward as possible, often to within a short distance of the aid station, and loaded with litter cases or sitting wounded. Difficult terrain, such as the mud of New Guinea, Burma, France or the mountains of Algiers or Italy, did not stop the ambulance "jeep."

Medical officers at clearing stations examined the wounded and sorted the seriously wounded from the slightly wounded (this process of sorting was called triage). Prompt attention was given to the seriously wounded by trained shock units or surgical units. Seriously wounded patients who could be transported were sent as soon as possible to special hospitals, either surgical or field hospitals. Often a platoon or two of an auxiliary surgical group was assigned to a field or surgical hospital to give expert surgical care to the nontransportable seriously wounded. Many lives and limbs were saved by this system. Serious abdominal, chest and head wounds were expertly operated on near the front lines. Triage and early collection of casualties were also responsible for much of the success of the plan. Great credit was due the battalion aid man, who often braved withering fire to bring a wounded soldier back to the aid station.

Large-scale evacuation of wounded by air was another real advance in the treatment of the sick and wounded during World War II. Wounded were sent from clearing stations to designated air fields, where they were flown to general hospitals. During the early phases of the landings in Normandy, seriously wounded were flown from France to England for definitive care. It was estimated that 10% to 15% of all the sick and wounded in the European

theatre of operations were returned to the United States via military planes.

Hospital trains were used for the transportation of the wounded by rail.

The U.S. navy used a similar method of evacuation with few modifications. Wounded were evacuated to aid stations where bleeding was arrested, wounds were dressed and burns and shock were treated by administration of plasma. Those able to be evacuated were taken to ships, and abdominal cases, open chest wounds and head injuries had early priority. No wounded still in shock were evacuated beyond that aid station. Amphibious vehicles and L.S.T.s were found the most satisfactory means of evacuating wounded.

In an amphibious operation certain vessels, transports, destroyers and L.S.T.s were designated to receive casualties and remained offshore while the remainder of the invasion force returned to its base. Ships standing offshore received wounded by various methods. Wounded were classified as soon as they were brought on deck. Seriously wounded were treated for shock at once. As soon as they were out of shock they were taken to the operating room, where the necessary surgery was performed. Proper treatment of shock with plasma, heat and morphine allowed many to have early surgery done. The surgeon was given greater freedom of action by the careful selection of anaesthetics. The proper use of inhalation anaesthetics, oxygen and carbon dioxide mixtures did much to reduce mortality from severe chest, head and abdominal wounds. Intravenous anaesthetics such as pentothal sodium were found invaluable for operations requiring a short time, and such anaesthesia was used in more than half of all cases on several ships. Special cases required spinal and local anaesthesia. Less severely wounded were sent to dressing, ambulatory, medical or observation wards for appropriate treatment. As soon as a complement of sick and wounded had been gathered, hospital ships or transports left the combat zone for a base where definitive care and reparative surgery could be given. In conformity with the Geneva and Hague conventions, hospital ships were painted white, marked with red crosses and a green stripe, and were fully lighted between sundown and sunrise.

Combat Fatigue.—Psychiatric conditions constituted a large proportion of cases medical officers had to treat. Anxiety neurosis, conversion hysteria and other mild neuroses were treated by psychotherapy, rest, group psychotherapy, occupational therapy, narcosynthesis, analysis and other accepted methods of treatment.

Combat fatigue was most successfully treated in forward areas. The farther to the rear that these patients were evacuated, the less was the likelihood of their return to duty. Specific treatment for physical fatigue combined with individual treatment of anxiety symptoms gave excellent results in forward hospitals. Group psychotherapy was most helpful when enthusiastic and understanding medical, nursing and hospital staffs were able to make the patients feel a part of the treatment group. Skill and experience were needed to achieve these aims. The new group became to the men a substitute for their old combat organizations, and the patients were helped to regain some of the stability they had lost during combat. Within a few weeks, association with the hospital group permitted many men to regain their equilibrium so that one-half of the men voluntarily asked to be transferred to their former combat units. (See also NURSING, WAR; PSYCHIATRY; REHABILITATION OF THE DISABLED.)

Milk

The production of milk increased steadily in the United States during the decade 1937-46 and reached a new high record in 1945. The nation was fortunate in that the cycle of cow numbers, which had reached a peak in 1934 and declined until 1938, was beginning to increase when World War II began. The number of milk cows increased from 22,575,000 head in 1925 to 26,931,000 head in 1934 and then dropped to 24,834,000 head in 1938. By 1945 the number had increased to 27,674,000 head; there were 26,785,000 head on Jan. 1, 1946.

Milk production during this period increased steadily, although the production per cow dropped off after 1942 because of a smaller number of cows being milked—a reflection of the acute labour shortage on farms. The total milk production reached a record high point of 123,000,000,000 lb. in 1945. In the campaign for greater food production the government estimated the U.S. need at 140,000,000,000 lb. for 1943 but, realizing that such an increase was impossible, set the goal at 122,000,000,000 lb.; actual output was 120,966,000,000 lb. The less favourable price of milk compared with the cost of feed and the growing labour shortage combined to hold down production. Dairymen complained of government controls and shipping difficulties and the lack of machinery. Widespread disturbances were a factor in unsettling the milk producing industry in 1937 and 1938. Local milk control boards were set up to foster price agreements between producers and distributors. The federal government presented cases against producers, distributors and wagon drivers in the Chicago area, thereby creating widespread unrest. With the outbreak of World War II in 1939, canned milk became important and the milk drying industry began to expand rapidly. The striking changes in the milk industry were the increase in production of evaporated milk and the decline of butter for civilian consumption. Higher consumer purchasing power led to the use of more whole milk, which reached a high record of 410 lb. per capita in 1944. At the same time the production of butter dropped to 12 lb. per capita, the lowest in 20 years, and civilian consumption was the lowest in half a century because of the large amounts taken by the government for the military forces. A large part of the cheese production was also reserved for the military forces, and civilian consumption declined.

When the United States entered World War II, the use of dried milk in place of evaporated milk was adopted because the former required less cargo space in ships. When lend-lease shipments began, evaporated milk was called for and since butter was not in demand for lend-

French Red Cross nurse pouring milk for a baby in the slum section of Marseilles. American Red Cross donations of milk reached Free France in 1941 before U.S. entry into the war

lease, manufacturers were urged to convert to produce evaporated milk. The production of evaporated milk increased from about 4,065,000,000 lb. in 1937 to 7,450,000,000 lb. in 1944. Dried whole milk increased during the same time from 103,000,000 lb. to 1,465,000,000 lb.

Civilian consumption of fluid milk increased steadily during the decade from an average of 340 lb. per capita in 1935-39 to about 450 lb. in 1946. While in 1946 retail milk prices were raised quite generally, these prices had remained quite stable through the period 1937-44 at around 13 cents per qt. for milk sold retail by producers, and 15 to 17 cents per qt. in cities.

Price supports on manufactured dairy products were begun in April 1941, when minimum prices for butter, evaporated and dried milk and cheese were established. The price of butter was then fixed at 31 cents per lb. at Chicago. In March 1942 this price was increased to 36 cents, in July to 39 cents and in November to 46 cents. The prices of cheese and dry milk were set in the equivalent to butter. These price support programs were discontinued on Dec. 31, 1944.

Subsidies were used after 1942 to get high milk production without increasing prices to consumers. These were in three forms: production payments direct to producers; payments to processors of cheese and butter; and the purchase and resale of fluid milk in 13 metropolitan centres. During 1943 these three subsidies amounted to about 4% of the farmer's cash income for dairy products, 15% in 1944 and 16% in 1945. The total amounts so expended were \$126,900,000 in 1943; \$501,700,000 in 1944; \$602,200,000 in 1945; and an estimated \$500,000,000 in 1946.

Dairy feed payments were begun in Oct. 1943 following

the fixing of price ceilings on dairy products in late 1942. Feed costs rose sharply through 1943, making milk production unprofitable, and it declined. A processor's subsidy of $3\frac{3}{4}$ cents per lb. was begun in Dec. 1942 and continued until Feb. 1946. A butter subsidy began in June 1943 and continued until Nov. 1945. The fluid milk subsidies started in April 1943 and were replaced by a purchase and resale program under which the government purchased the milk from the handlers at a higher price and sold it back to the dealers at the old price so as to absorb the difference in price.

The dairyman's price for milk rose from an average of \$1.49 per 100 lb. for 1935-39 to \$2.02 in 1941; \$2.38 in 1942; \$2.50 in 1945; \$4.30 in Dec. 1946. In relation to feed costs, prices received by farmers for dairy products were above the prewar relationship after the beginning of World War II. Until 1943, however, prices of other farm products increased more rapidly than dairy products, leading the government to institute production payments to stimulate dairy production in 1944 and 1945. Prices of feed advanced sharply in 1943. Although returns to dairy-men compared favourably with returns to producers of other livestock, the number of cows kept for milk began to decline in 1945. The supply of labour and higher farm wage rates apparently had more than the usual effect on dairymen's actions. The heavy purchase of grains for export for relief purposes in 1945 and 1946 created a strong competition for dairy feeds, particularly in the feed-deficit areas.

The high price of dairy cows was another factor checking production. Milk cows averaged \$54.00 per head during 1935-39 and rose steadily to about \$125.00 per head in early 1946, a 37-year record. This reflected the higher prices of meat in general and the better quality of the cows sold. The total value of sales of dairy products reached a record total of \$3,600,000,000 in 1945, including about \$500,000,000 in direct production payments.

Exports of dairy products increased greatly during World War II as they did in World War I, although during the period between the wars exports and imports were in close balance. The peak of exports came in 1919 and again in 1944 but differed in the kinds of products exported. In 1919, exports amounted to 34,536,000 lb. of butter, 14,160,000 lb. of cheese, 852,865,000 lb. of evaporated and condensed milk, while in 1944 87,500,000 lb. of butter, 274,245,000 lb. of cheese and 592,635,000 lb. of evaporated and condensed milk were exported, in addition to 32,683,000 lb. of dry whole milk and 206,688,000 lb. of nonfat dry milk. The latter products represent a much larger quantity of whole milk than butter, cheese or condensed milk. The total exports for World War II represented nearly 5% of total U.S. production. Large quantities of dairy products for export were transferred from the armed forces late in 1945 and early 1946. However, orders were issued that processors should set aside 40% of their cheese and 60% of nonfat dry milk for government purchase in May and June 1946.

World milk production was maintained to a remarkable degree through the decade 1937-46. Compared with prewar levels, milk consumption was high in the United States, Canada and the United Kingdom. Milk production in Europe, which in prewar years amounted to about one-half of world production, had dropped 25% by 1944 and made further losses in 1945 and 1946. The U.S. department of agriculture estimated that 1946 production in Europe was only 65% of prewar production. With better feed supplies, the output of milk showed increases in Canada, Denmark, Switzerland and Argentina in the first

half of 1946. No estimates were available for the soviet union, but considering the large losses of livestock during the war the national total was probably much below the 63,000,000,000 lb. reported by soviet officials for 1938. (See also BUTTER; CHEESE; DAIRYING.) (J. C. Ms.)

Production of Milk in United States, 1937-46
(in pounds)

Miller-Tydings Act

See ADVERTISING.

Millis, Harry Alvin

Millis (1873—), U.S. economist and labour arbitrator, was born at Paoli, Ind., on May 14, 1873. After receiving his bachelor's and master's degrees at Indiana university and his doctorate at the University of Chicago, he was appointed professor of economics and sociology at the University of Arkansas in 1902. The following year he joined the faculty of Stanford university, and from 1912-16 he was chairman of the department of economics at the University of Kansas. In 1916 he went to the University of Chicago as professor of economics. As chairman of the board of arbitration for the men's clothing industry in Chicago in 1919, he first became associated with the problems of labour disputes. He became widely known for his tact and perseverance in effecting conciliations between employer and labourer. In 1934-35 he was a member of the National Labor Relations board, and Pres. Roosevelt again appointed him to the board in Nov. 1940, when he succeeded J. Warren Madden as chairman. Millis was also permanent conciliator between the United Automobile Workers' union and General Motors corporation. He remained chairman of the NLRB until June 1945, when he was succeeded by P. M. Herzog.

See ABRASIVES.

Mindszenty, Joseph

Cardinal Mindszenty (1892—), cardinal archbishop of Esztergom, Hungary, and primate of Hungary, was born at Csehimindszenty, Hungary. He was ordained in 1915. Named bishop of Veszprima in March 1944, he was elevated to the archbishopric of Strigonia in Oct. 1944 to succeed Justinian Cardinal Seredi. He consistently refused to submit to nazi threats, and was arrested and remanded to jail for four months in 1944 for defying the nazi-sponsored Premier Frederic Szalasi. On Sept. 24, 1945, he was appointed archbishop of Esztergom and primate of Hungary. He was created a cardinal by Pope Pius XII on Feb. 18, 1946.

Mineral and Metal Production and Prices

In the mineral industries of the world, the decade 1937-46 was a memorable one, for reasons other than war alone. In 1929, world mineral production had reached a record level, only to be followed by the lean years of the depression which brought the over-all production level down to where it had stood in 1917. Although the United States lagged somewhat behind the rest of the world in recovery from the effects of the depression, the 1936 world

mineral activity almost equalled the former record year of 1929, and 1937 passed it by a considerable margin. The recession of 1938 still left world output higher than in 1929, and 1939 slightly exceeded the 1937 level.

Under the demand for minerals created by World War II, production of almost every important mineral commodity was increased, while those most essential to the war program were expanded many fold. Not only were old, established industries enlarged, but new ones, all of which required mineral products, were created. Even the old, familiar standbys like iron, copper, lead and zinc were required in such quantities that three years or more of strenuous production effort were consumed in bringing production up to where it could meet the essential war demand, with only meagre rations left for ordinary civilian needs.

The production record of the war years still contained many gaps at the end of 1946, some of which would probably never be filled. Information withheld by censorship for security reasons had been largely released, though delays were caused by lack of help. In some countries in the active war zones, conditions became so disorganized that it became difficult, if not impossible, to collect and compile production data, and probably in some cases data already collected was destroyed.

Almost immediately after the cessation of hostilities, representatives of various U.S. government agencies were sent to the axis and occupied countries to collect information along technical and statistical lines, and it was through their efforts that much of the desired information was secured promptly.

The statistical data still lacking were chiefly from the smaller European countries in the active war zone, and a few others, where the difficulty seemed to be a matter of delay in compiling and reporting. Inspection of the various world production tables accompanying most of the reviews of the mineral commodities showed relatively few figures missing from major producers, except in the cases of the U.S.S.R. and Japan, both of which followed a policy of restricting information of this kind. While the results were less complete for the minor producers, these nations usually contributed such a small proportion of the total that a fairly good idea could be had of the world picture, in spite of these gaps.

To show the trend of world production, both with respect to countries and commodities, there are presented a series of tables covering the major producers and their most important contributions to the world mineral production in 1937, 1941 and 1945. (See Tables I to III). These tables were compiled mainly from the publications of the U.S. bureau of mines, but in numerous places gaps were filled from other sources; many of the figures on metal content of ores were obtained from the *Yearbook* of the American Bureau of Metal Statistics, and most of the steel figures are from *Iron Age* (Chilton Company, Inc., New York). For the most part, these tables conform to the tables of world production accompanying the reviews of the individual commodities, but at times differences will be found.

Prices.—To supplement the preceding information of production, it is also interesting to have correlative information on prices; Table IV presents the year-end prices for a selected group of the more important minerals and metals, as quoted on the New York market for each year from 1937 to 1946, while Table V covers the same group of commodities as quoted on the London market.

During the years of World War II, prices for most of

Table 1.—World Mineral and Metal Production in 1937
(Metric tons unless otherwise specified; Th. indicates thousands and Mi. millions of units.)

these commodities were under official government control in both countries, and showed little change from year to year. Where changes did occur, they usually reflected conditions of considerable importance in connection with the commodity in question. Most of the control prices were still in effect at the end of 1945, but the 1946 quotations show clearly the effect of the removal of price controls. In the United States all controls were released, but British prices on aluminum, copper, lead and zinc were still under official control at the end of 1946.

Reconversion and Rehabilitation.—The mineral industry in different parts of the world at the end of the decade 1937–46 was largely divided into two groups, each faced with its own peculiar problems. One group included producers located in areas where active warfare had affected operations, or where progress had been retarded by axis occupation and the subsequent disorganization that followed liberation. The other group included those outside the active war zones, most of whom had been called on for expansion of output far beyond normal levels of operation. The second group was faced with the necessity of pruning overgrown production facilities back to a size comparable with postwar demands, without knowing exactly what those demands were going to be. During the war years, the bulk of the output was required for essential war uses, and a large volume of demand for products for normal civilian and industrial uses was built up; additional demand was to be expected from the reconstruction and rehabilitation of areas devastated by the war. In the United States, reconversion was hampered greatly by labour disputes, and even at the end of 1946 had not gotten into full stride.

However painful the headaches of reconversion were considered, they were mild as compared with those suffered by producers in the active war zones, where production capacity had been destroyed by one side or the other in the conflict, and sometimes by both in turn. Both rehabilitation and reconstruction were necessary, sometimes from the ground up, with materials, labour, transportation and food all in short supply. In some cases coal was lacking simply because men did not have enough food to give them strength to swing a pick—aside from the fact that they did not have the pick. At the same time, food was short for lack of fuel to process and transport it.

In practically all of the axis-occupied countries there was a period of almost complete disorganization following liberation, and production activity slowed down almost to the stopping point. After governments had been reorganized, much of this trouble was remedied, as evidenced by the steady increases in monthly production statistics. In a few cases output was built up to prewar levels, but in many cases there was still shortage of labour because of population displacements, the inefficiency of available labour, lack of proper food, tools and equipment, and disorganization of transportation. Full rehabilitation of the devastated areas was a long and painful task, as yet not more than well started by the end of 1946. (See also STRATEGIC MINERAL SUPPLIES, and articles on individual metals and minerals.)

(G. A. Ro.)

Mineralogy

Minerals and mineral products being essential not only to highly mechanized civilization, but also in modern warfare, many significant advances were made in mineralogy during the decade 1937–46. Among the important contributions to the winning of World War II made by mineralogists, the most noteworthy were (1) the improve-

ment of radio and electronic apparatus by the extensive use of piezoelectric oscillating quartz plates; (2) the production of synthetic rubies and sapphires and their fabrication into bearing jewels for precision instruments; (3) the production of wire-drawing diamond dies and bonded diamond wheels.

Oscillating Quartz Plates.—Although piezoelectric oscillating quartz plates had been in use from 1930 for controlling radio frequency, the annual production of these tiny, thin plates, some about half the size of an ordinary postage stamp, was relatively small and was expressed in thousands. Immediately following the attack on Pearl Harbor, the enormous demand for these plates for use in war matériel necessitated the production of tens of millions annually. This was caused by the many applications of the plates, summarized as follows: (1) For frequency or wave length control in radio transmitters and receivers, and as multivibrators for providing frequency and time standards in place of tuning forks, clocks, etc.; (2) in sending and receiving elements for the transmission of sonic or supersonic waves through air, liquids, or solids; (3) as the sensitive element for pressure gauges used for measuring pressures in engine or compression cylinders, in gun and cannon barrels, etc.; (4) in audio or radio frequency filters used for the multitransmission of messages over a single wire circuit, or one radio channel.

During World War II, these plates permitted the radios in planes, ships, all sorts of vehicles and in walkie-talkies to keep tuned to the proper station. In fact, the extensive and complicated systems of radio communication so necessary for the successful prosecution of the war would have been impossible without the use of these oscillating quartz plates.

In making possible this enormous production, new methods and apparatus had to be devised. This required the close co-operation of expert crystallographers and mineralogists with technologists and industrial managers. The achievements, which were truly spectacular, were recorded in the "Symposium on Quartz Oscillator Plates."

Hydraulic tensile machine making motion picture recordings of atomic crystal movement

published in the May-June 1945 issue of the *American Mineralogist*. Without the services of Harry Berman, C. Frondel, K. S. Van Dyke, S. G. Gordon, J. S. Lukesh, W. Parrish, R. E. Stoiber, C. Tolman and R. D. Butler, the extraordinary demands of the war effort could not have been met. The results achieved were of paramount importance to the radio and electronic industries.

The Brazilian states of Minas Geraes, Goyaz, and Bahia were the principal sources of quartz crystals suitable for oscillator plates. According to W. D. Johnston, Jr., and R. D. Butler (*Bul. of the Geol. Soc. of Amer.*, vol. 57, pp. 601-650, 1946), some crystals weigh up to 40 metric tons, while those of 1 to 5 tons occur in many deposits. The potential reserves of quartz crystals in Brazil are large.

Diamond Dies, Wheels and Tools.—When the nazis overran France, Belgium, and the Netherlands in 1939, the supply of diamond wire-drawing dies and of synthetic rubies and sapphires was cut off. This caused a critical situation, and frantic efforts were immediately made to produce these products in the United States and Great Britain.

Wire-drawing dies were essential in the production of precision wire used in large quantities in the manufacture of radio, electronic and electrical apparatuses. Although very few persons had experience in this field, excellent progress was made. Industry was soon supplied with sufficient quantities of domestically produced diamond dies which gave adequate service. In Great Britain, similar success was achieved.

In order to reduce the time necessary to produce these diamond dies, C. G. Peters and W. B. Emerson of the national bureau of standards in Washington, D.C., devised an electric drilling method for the manufacture of dies of small diameter, called superfine dies. These were commonly designated as triple nought dies, since the diameters were as small as 0.0003 of an in., or three tenths of a mil. By this electric method, the dies could be produced in a small fraction of the time required by the old method.

In addition to the production of diamond dies, the war effort led to the development of bonded diamond wheels, which found wide application for abrasive purposes. These wheels made use of a grade of industrial diamonds, called crushing boart, for which there had previously been no market. During the ten years 1937-46, there was a marked increase in the use of diamond set tools for the precision machining of metal and other parts.

Diamond Gem Industry.—Prior to the war, 95% of the world's supply of cut and polished diamonds was furnished by Belgium, the Netherlands and Germany. When these sources were cut off, efforts were made to expand the diamond-cutting industry elsewhere. This was done in the United States, Great Britain, Palestine, Brazil and South Africa. The success of the gem cutters of these countries in competing with the older industries of continental Europe after the return of peace, however, was highly problematical.

Diamond Symposiums.—The interest in the greatly increased use of the diamond led to the conducting of three symposiums, the first of the kind ever held, in which 14 experts participated. Their papers, which appeared in the *American Mineralogist* vol. 27, pp. 162-191, 1942; vol. 28, pp. 141-150, 1943; and vol. 31, pp. 135-167, 1946, constituted a highly important contribution to knowledge of the properties and uses of the diamond.

Artificial Diamonds.—Many experiments were conducted to produce the diamond in the laboratory, and some scientists, notably the French chemist Henri Moissan, were

widely credited as having been successful. However, when the various experiments were repeated, and the products examined with modern optical and X-ray methods, it was shown conclusively that the products were not diamonds. In 1943, A. F. Bannister and K. Lonsdale (*Mineralogical Magazine*, London, vol. XXVI, pp. 315-324) announced that J.B. Hannay had actually made the diamond in 1880. This statement was based upon the examination by modern X-ray methods of specimens found in the mineral department of the British museum and allegedly made by Hannay. While the methods used by Bannister and Lonsdale and their identification of the specimens were not open to question, their conclusion that the specimens were actually made by Hannay was not justified by the available facts. Accordingly, up to 1946, no incontrovertible proof had ever been presented that the diamond had been made artificially.

Large Diamonds.—In July 1938 a diamond weighing 726.6 carats, called the Vargas, was found in Minas Geraes, Brazil. It was purchased and cut by Harry Winston, Inc., of New York city. The weights of the largest 16 stones varied from 48.26 to 10.05 carats. Another large diamond weighing 770 carats was reported Jan. 1945 from Sierra Leone, Africa, which was claimed to be the largest diamond ever found in alluvial deposits. The Liberator, weighing about 155 carats, was the largest diamond ever found in Venezuela. Purchased in 1943 by Harry Winston, Inc., it was cut into four stones ranging in weight from 39.8 to 1.44 carats. It was reported in 1943 that the Punch Jones of 34.36 carats had been found in 1928 at Petersburg, West Va., and was the largest diamond ever recovered from alluvial deposits in the United States. (See also DIAMONDS.)

Synthetic Rubies and Sapphires.—In the production of all kinds of precision instruments such as watches, chronometers, and electrical meters, another critical situation was caused by World War II. There was a greatly reduced supply of small jewels and hard bearing parts made of synthetic rubies and sapphires necessary in the manufacture of these instruments. Prior to the war, synthetic rubies and sapphires were made and fabricated into jewels and bearings in Switzerland, France and Germany. As the rest of the world had depended upon these sources, it was necessary to develop new industries in the United States and Great Britain. In the United States, the Linde Air Products company, Inc., attacked the problem energetically and with great success. An efficient plant was built at South Chicago, and U.S. industrial needs were adequately met. The methods of production and fabrication were greatly improved and highly mechanized. In Great Britain, where satisfactory results were also achieved, plants were developed at Salford and Manchester.

Technical Journals.—To disseminate information concerning the rapidly expanding industrial uses of the diamond, a monthly journal, the *Industrial Diamond Review*, was founded in Great Britain in Dec. 1940. For three years, it appeared as a section of the *Goldsmith's Journal of London*. The success of this pioneer publication was immediate, and it later appeared as an independent journal. Shortly before World War II, a journal of applied mineralogy, *Die Zeitschrift für Angewandte Mineralogie*, was founded in Germany.

Large Laboratory-Made Crystals.—In the construction of some scientific instruments, e.g., those used in infra-red and ultra-violet spectroscopic research, large crystals are necessary. Since sufficiently large crystals and of the re-

quired purity are not found in nature, techniques were developed during 1937-46 whereby laboratory-made crystals of sodium chloride, potassium bromide, lithium fluoride and sodium nitrate, weighing up to 35 lb., became available. By using large prisms made from these crystals, some spectroscopic analyses could be made more rapidly and accurately than by chemical methods.

Crystallographic Union.—With the introduction of X-ray and electron diffraction methods, the study of crystals and crystal structure was greatly extended. By 1946, crystal studies were being conducted by crystallographers, mineralogists, physicists, chemists, metallurgists and biologists. The accumulated information had become so large and so widely distributed in many different scientific publications, that the formation of an International Crystallographic union in London was contemplated in 1946, to foster close co-operation among the various specialists.

Roebling Medal.—In order to recognize more fully meritorious achievement in mineralogical science, the Mineralogical Society of America established the Roebling Medal in honour of Washington A. Roebling, one of the builders of the Brooklyn bridge and a leading mineral collector of his time. Awards during the decade were made to C. Palache, Cambridge, Mass. (1937); W. T. Schaller, Washington, D.C. (1938); L. J. Spencer, London, England (1940); E. S. Larsen, Jr., Cambridge, Mass. (1941); E. H. Kraus, Ann Arbor, Mich. (1945).

Dana's System of Mineralogy.—Because of its long and honourable record, the publication in 1944 of vol. one of the seventh edition of *Dana's System of Mineralogy* was an event of great significance in U.S. science. The first edition of this widely used reference work was issued in 1837 and it had long been characterized as a scientific bible. The new edition by C. Palache, H. Berman and C. Frondel, of Harvard university, incorporated the many scientific advances made in the study of minerals after the last edition appeared in 1892. The elements, sulphides, sulphosalts and oxides were described in vol. one of the new edition.

Public Interest.—During the decade 1937-46, the general U.S. public became more mineral- and gem-conscious than ever before. This was the result of (1) the widespread publicity given to the need and availability of strategic minerals, e.g., those containing uranium and thorium in the development of atomic energy; (2) the marked increase throughout the country in the number of mineralogical organizations and journals devoted to the study, collecting, and displaying of minerals and the cutting and polishing of those suitable for gem purposes; (3) the many popular magazine articles and books dealing with minerals and gems which had appeared in late years. (See also GEOLOGY; MINERAL AND METAL PRODUCTION AND PRICES.)

Mineral Pigments

Production of iron oxide and earth pigments in the United States was stimulated by the cutting off of imports during the years of World War II. Production statistics were reported only after 1942, as follows in short tons: 1942-97,327; 1943-100,216; 1944-97,018; 1945-101,014. Imports of the major types (not total imports) declined from 18,488 tons in 1939 to 1,459 tons in 1943, recovering to 6,049 tons in 1945. (G. A. Ro.)

Minnesota

A north central state of the United States, popularly known as the "Gopher state," Minnesota has an area of 84,068 sq. mi., of which 4,059 are water. Population (1940) 2,792,300 (estimate, July 1, 1944, 2,508,663). Of the total population, 50.2% was rural; the native-born white inhabitants in 1940 numbered 2,474,078, foreign-born, 294,904 and Negro, 9,928.

Capital, St. Paul (287,736). The only city in the state with a larger population was Minneapolis (492,370); Duluth had 101,065.

Principal officers of the state at the beginning of the decade 1937-46 were: governor, Elmer A. Benson; secretary of state, Mike Holm; treasurer, C. A. Halvorson; auditor, Stafford King; attorney general, William S. Ervin; commissioner of education, John G. Rockwell; chief justice, Henry M. Gallagher.

In the 1937 legislative session the Farmer-Labor party attempted to fulfil its mandate from the 1936 elections. Governor Benson, inaugurated Jan. 5, proposed reforms in education, taxation, conservation, labour and other fields. Clashes between a conservative senate and a Farmer-Labor house impeded action. A deadlock on tax measures prolonged the session beyond the legal deadline, and a special session was called. Out of the two sessions emerged a dozen tax bills effecting increases in virtually all taxes save the property tax. Other legislation included acts establishing county welfare boards; creating a state geographic board; amending the Workmen's Compensation law to require all employers to carry compensation insurance; eliminating state levies on homesteads; extending highway traffic regulation and authorizing cities and villages to acquire recreational facilities and operate programs of public recreation. A study of state and local government, made under gubernatorial authority, eventuated in a state finance and tax survey and a demand by the governor for elimination of overlapping activities, for reorganization and for economy.

State officers elected in Nov. 1938 were governor, Harold E. Stassen; secretary of state, Mike Holm; treasurer, Julius A. Schmah; auditor, Stafford King; attorney general, J. A. A. Burnquist. The commissioner of education was

Co-operative farming in Minnesota, as illustrated by this unit of three well-kept farms at Excelsior. Despite a high diversification of crops, Minnesota continued to lead the U.S. in butter production, and supplied much of the dairy produce shipped to U.S. armed forces overseas as well as to the United Kingdom, during World War II

John G. Rockwell; chief justice, re-elected, Henry M. Gallagher. The total vote was the largest ever cast in an off-presidential Minnesota election. Harold E. Stassen, a Republican, won the governorship by a vote of 678,839 against 387,263 for Elmer A. Benson (Farmer-Labor), 65,875 for Thomas Gallagher (Dem.) and 899 for John W. Castle (Industrial). Republicans won a landslide victory, gaining all state offices and control of the legislature. In the congressional race seven Republicans and one candidate each for the Democratic and Farmer-Labor parties were elected. The new governor advocated civil service for state officeholders, improvement of social security laws, reorganization of state departments, reduction of state tax on property, labour relations legislation and the building up of industry to reduce unemployment. He opposed a sales tax.

The 1939 legislature met from Jan. 3 to April 19, enacting every proposal made by Governor Stassen to the legislature in his inaugural message. Headlining the list was a sweeping reorganization act, which abolished three administrative boards and consolidated many others. A civil service department was set up, headed by a three-man board and a director, Kenneth Pennybaker, with control over more than 12,000 state employees. The Labor Relations act, one of the significant new laws, stressed arbitration and conciliation; other laws were the Loan Shark act and the Homestead Lien on old-age pensioners. The four-cent gasoline tax was continued until Sept. 1940, and the royalty tax on iron ore was increased 1%. The executive council, the state board of control and the commissioner of administration and finance were replaced by the commissioner of administration, the social security department and a single tax commissioner. At the end of 1939 the governor said that the state debt had been cut by more than \$5,000,000 and he reported economies in the cost of state government.

From April 1939 to June 1940, following the passage of the labour conciliation law, 39 strikes resulted from a total of 553 notices given, and wage losses from strikes in the state were cut in half. Labour disputes affected a farm implement machinery company, a power company, metal products, laundries, ice cream companies, a refrigerator company and nine foundries. The federal government intervened in settling the refrigerator strike so that work could proceed on national defense contracts. WPA spent an estimated \$44,637,086 in Minnesota in 1940, giving work to a monthly average of 39,921 persons. Joseph H. Ball was appointed to fill the vacancy in the senate caused by the death of Ernest Lundeen. Ernest L. Olrich was appointed co-ordinator for the state Defense Industrial commission. Governor Stassen was selected to give the keynote address at the Republican National convention held in June.

In the Nov. 1940 presidential election, Roosevelt secured 644,196 votes, Wendell L. Willkie 596,274. Governor Stassen was re-elected by a plurality of 200,000 votes. Sen. Henrik Shipstead, who withdrew from the Farmer-Labor party to join the Republican ranks, won a fourth term. Republicans elected their entire state ticket and eight of the nine congressmen. The Farmer-Labor party ranked second in the voting on state offices, but the Democrats increased their strength to a marked degree. Conservatives had

strong control of both houses of the legislature. Other officers re-elected were: lieutenant governor, C. Elmer Anderson; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist; chief justice, Henry M. Gallagher.

During 1941 the legislature adopted a broader child-welfare program, provided for the enlargement of the Gillette State Hospital for Crippled Children, improved the labour conciliation law, amended the unemployment compensation law, provided for paying rural credit losses and liberalized the old-age assistance lien.

Stassen, Holm, Schmahl, King, Burnquist, and Gallagher were all re-elected in 1942. The entire Republican ticket carried the elections. Ed Thye, whom Stassen selected as his running mate, was elected as lieutenant governor. Special interest centred in Thye's election because Governor Stassen had announced that he would resign to enter active service in the navy when the legislature adjourned; thus the lieutenant governor would be his successor. Joseph H. Ball was elected U.S. senator by a large majority, and Arthur E. Nelson was chosen to fill the short-term vacancy. The dominant note in Minnesota was war-mobilization of industry, intensified mining, accelerated agriculture, bond sales, the development of munitions plants and the departure of men for the armed forces. (T. C. B.; X.)

The 1943 session of the legislature passed more laws (666) than any Minnesota legislature from 1891; much of the increase was due to the number of salary increase laws, made necessary by the rising cost of living. A war-powers act was passed giving the governor special emergency powers. A state department of aeronautics was established and charged with the licensing of pilots and administration of airport laws. Laws were passed for the relief of servicemen, and a fund of \$2,500,000 was to be set aside to aid veterans and their families. Other legislation included acts establishing the Iron Range and Rehabilitation commission, increasing from 9 to 10½% the tax on iron ore, revising the income tax law, suspending the money and credit tax for 1943-44, increasing old-age pensions to \$40 and raising the amount of aid to dependent children.

Minnesota: Statistical Data

Table I.—Education (Public)

	1938	1941	1942	1943	1944	1945

Maximum benefits under the unemployment compensation law were raised from \$16 to \$20 a week, and an act extended workmen's compensation to cover all occupational diseases.

The real estate levy was cut from 9 mills to 6 mills the first year and to 5½ the second year.

A special session of the legislature convened on March 8, 1944, to give the men and women of the armed forces the right to vote. On April 5 the Farmer-Labor party, which had its first ticket on the state ballot in 1918 and dominated the state from 1930 to 1938, merged with the Democratic party under the title Democratic-Farmer-Labor party. In the November election, Pres. Roosevelt received 589,864 votes and Thomas E. Dewey 527,416. Edward J. Thyne was elected governor by a plurality of 271,053 votes. He received 701,185 votes, the largest number ever received by a gubernatorial candidate in the state's history. All the Republican state office incumbents were re-elected. Dean M. Schweickhard was elected commissioner of education by the state board of education. An aviation amendment to the constitution was passed, giving the state permission to expend funds for development of airports and an airport system, to levy taxes on gasoline used for aviation purposes and a state tax on aircraft in lieu of the personal property tax. (L. BE.; X.)

The legislature, meeting in regular biennial session in 1945, devoted itself largely to preparations for the demands expected in the postwar period. It authorized appropriations of \$19,512,000 for state buildings and improvements. The Minnesota highway department arranged for a program of highway building, which with federal aid, was expected to make possible \$74,000,000 of construction in the first three postwar years. A postwar planning commission was established to stimulate and co-ordinate postwar planning. An act was passed authorizing a veterans' service officer in each county. Funds for old age assistance, aid to dependent children, aid to blind and aid for local schools were increased. (L. BE.; E. J. TE.; X.)

In Nov. 1946, Luther W. Youngdahl was elected governor for 1947-48; Edward J. Thyne was elected United States senator. The 54th session of the legislature, meeting in regular biennial session in 1945, devoted itself largely to preparations for the demands expected in the postwar period, including authorization for a state building program, creation of a postwar planning agency and authoriza-

tion for each of the 87 counties to appoint a veterans' service officer. No special sessions were held during the interim.

(R. B. J.)

Minor, Robert

Minor (1884–), U.S. communist leader, was born July 15, 1884, in San Antonio, Tex. His father was a schoolteacher, lawyer and district judge, and his mother was a member of Gen. Sam Houston's family. Young Minor attended school only four years and in his teens worked as a messenger boy, sign painter's apprentice and carpenter. For a time he was cartoonist on the *San Antonio Gazette* and the *St. Louis Post-Dispatch*. In 1907 he joined the Socialist party, dividing his time between cartooning and political activities. Later he was cartoonist for the *New York World*, then for the socialist newspaper, the *New York Call*. In 1916-18 he was an organizer for the International Workers' Defense league, handling publicity in the Tom Mooney case. He was a war correspondent in Russia in 1918, and from 1924-26 lectured for the Communist party. Chosen editor of the *Daily Worker* in 1928, he was communist candidate for mayor of New York city in 1933 and for governor of New York in 1936. When Earl Browder, leader of the U.S. Communist party, was imprisoned in 1941 for passport fraud, Minor, assistant general secretary, became acting general secretary of the party. Minor was removed from the national committee of the party in July 1945, at the same time that Browder was deposed from the leadership.

Minorities

The importance of minorities grew in the 20th century with the spread of democracy and the ideal of self-determination of all peoples. The existence of national minorities and their dissatisfaction had been one of the factors leading to World War I. The Ottoman empire (until 1913), the Austro-Hungarian monarchy and the Russian empire were outstanding examples of states containing national minorities which were dissatisfied under the impact of the nationalism which spread in the 19th century. Germany had in its Polish provinces, in Schleswig and in Alsace-Lorraine, Polish, Danish and French minorities which longed for independence. In western Europe, the Irish in the British Isles, the Catalans in Spain and the Flemish in Belgium presented similar problems. After World War I the Irish and Flemish problems were solved by the political developments in Great Britain and Belgium, and the peace treaties of Paris in 1919 reduced considerably the number of minorities living under alien rule in central and eastern Europe.

The frontiers drawn at Paris and by the events in Russia corresponded more faithfully to the ethnical conditions than they did prior to 1914. Many small nationalities which had been deprived of their independence for a long time, regained it from the Baltic sea to the Adriatic. For historical, economic and strategic reasons, however, the new frontiers left large minority groups outside the countries where their conationals formed the majority of the population. In view of the impossibility of creating ethnographically clear-cut boundary lines, the peace treaties devised a new and progressive system of protection for racial, linguistic and religious minorities through the League of

Nations, to assure the remaining minorities equality of treatment in the new states, where also democratic constitutions newly introduced after western models assured all inhabitants full civic rights and equal status. This system of protection for the minorities broke down in the 1930s with the weakening of the League of Nations and with the advance of antidemocratic forms of government in central Europe.

The following list gives approximate figures for those national minorities in central and central-eastern Europe which in 1938 were of sufficient importance, either by their numbers or by their aspirations, to be of real or potential political importance. Figures marked † represent approximations between widely differing estimates; * signifies that the country in question was subject to League minority obligations.

*Albania (pop. 1,003,124, census 1930): †Greeks 50,000.

*Bulgaria (pop. 6,090,215, census 1934): Turks 578,000; Rumanians 69,000.

*Czechoslovakia (pop. 14,729,536, census 1930): Germans 3,318,000; Magyars 719,000; Poles 81,700; Carpatho-Ukrainians 569,000.

*Estonia (pop. 1,126,413, census 1934): Russians 92,000; Germans 16,000.

*Greece (pop. 7,336,000, census 1940): †Bulgarians 82,000; †Turks 103,000; †Albanians 20,000.

*Hungary (pop. 8,688,319, census 1930): Germans 478,630; Slovaks 104,819; Croatians 27,683; Rumanians 16,221.

Italy (pop. 42,993,602, census 1936): †Croatians and Slovenes 600,000; †Austro-Germans 200,000.

*Latvia (pop. 1,905,502, census 1935): Germans 62,000; Russians 233,000; Byelo-Russians 36,000; Poles 50,000.

*Lithuania (pop. 2,549,668, census 1938): Germans 71,000; Poles 73,000; Russians 44,000.

*Poland (pop. 32,106,400, census 1931): Ukrainians 4,200,000; Byelo-Russians 1,500,000; Russians 56,000; Lithuanians 300,000; Germans 1,700,000; Jews 2,700,000.

*Rumania (pop. 18,025,237, census 1930): Bulgarians 361,000; Germans 740,000; Magyars 1,426,000; Ukrainians 577,700; Russians 415,200; Turks 288,800.

Turkey (pop. 17,820,950, census 1940): Greeks 119,800; Armenians 64,700; Kurds 1,184,000.

*Yugoslavia (pop. 13,934,038, census 1931): Albanians 342,000; Germans 499,300; Magyars 468,000; Rumanians 229,800; Turks 132,000.

Breakdown of the System of Guarantees.—In the wave of aggression which spread over Europe after 1938, all protection and all democratic guarantees for minorities were destroyed. The dissolution of Czechoslovakia was followed in the same year by the conquest of Poland and the partition of that country between Germany and the U.S.S.R. In many cases of aggression or interference the principle of "protection of national minorities" or of "national self-determination" was used for purposes of expansion; thus Germany claimed those parts of Czechoslovakia inhabited by Germans (the Czechoslovak Sudetenland), while the U.S.S.R. claimed for protection of "racial brethren" the eastern parts of Poland, inhabited largely by Ukrainians and Byelo-Russians, and later the Czechoslovak Carpatho-Ukraine. In conformity with its principles of racial equality, the populations incorporated into the soviet union were treated on a footing of equality and were granted linguistic autonomy, but they were completely co-ordinated with the totalitarian regime existing throughout the soviet union. National socialist Germany, on the other hand, planned to reorganize Europe, not on the basis of equality of all peoples nor with an international protection for minorities, but on a hierarchical basis in which the German race would have the fullness of rights everywhere, while other peoples would be subordinated according to the needs and will of the German

"master race." Minorities would be protected, if at all, by Germany alone and according to its conception of the worth and value of each individual people and each individual minority.

The new frontiers established in central and eastern Europe between 1939 and 1941, partly as a result of German-Russian collaboration, brought many German minorities under new governments. While Germany wished some German minorities to remain in their countries—Czechoslovakia, Hungary, Rumania—to enjoy special privileges and to act as guardians of German influence, it tried to remove the German minorities from territories which fell under soviet domination. These minorities, although they had lived in their homelands for centuries, were removed forcibly and resettled in territory with non-German majorities but now under German control in an effort to Germanize these districts. With German aggression against the U.S.S.R. in June 1941, nazi domination was extended far into eastern Europe; there the Germans applied everywhere with utmost ferocity their theories of racial inequality; especially were the Slav peoples considered as helot races. The worst treatment by far was meted out to the Jews.

Yet all these changes of frontiers, dismemberments of existing states and forcible shifts of population, did not solve the minorities problem. Throughout the world the troubled period tended to create new problems and to accentuate existing ones on account of the fear of the possible use of minorities as "fifth columnists." The Italians used the small Albanian minority in the Greek Epirus as a pretext for their invasion of that country in 1940. The Germans tried to make dormant minority problems in the Low Countries and in France more acute. They favoured the Flemish nationalists in Belgium and even supported for a brief time a Breton independence movement against France. The victory of Gen. Franco in Spain was inimical to the Catalan and Basque minorities; their autonomy was taken away, and they were subjected to a ruthless process of forced assimilation. In the middle east, the Azerbaijan and Kurdish minorities in Iran were used

"It Must be Something He Ate," Thomas' cartoon version in *The Detroit News* of the old political adage that he who swallows minorities swallows poison

in 1946 by the soviet union as a weapon for interference in, and control of, Iran, and in a similar way alleged or real grievances of the Kurdish minorities in Turkey and Iraq and even "historical claims" of former Armenian and Georgian minorities on Turkish territory were cultivated with the goal of subjecting Turkey and other middle eastern countries to outside control. This rapid deterioration of international law and morality made the problem of minorities increasingly acute, after the actual hostilities of World War II had ceased in 1945.

Problems of the Peace.—In the peace settlements of World War II, minority problems played a great role. Thus they presented potential material for conflict in the drawing of the Italian frontiers, where the territory of Venezia Giulia with its principal city of Trieste was disputed between Yugoslavia and Italy, and the German South Tyrol between Austria and Italy. The German minority problem in Czechoslovakia and Poland was "solved" by the expulsion of the minorities in spite of the fact that they had been settled in their homelands for many centuries. This worked special hardship in the case of Poland, where the Germans were expelled from all the German provinces (eastern Prussia, Silesia, Pomerania) which Poland annexed from Germany in 1945. These lands, emptied of their German inhabitants, were to be resettled by Poles who had left the eastern Polish provinces annexed by the U.S.S.R. Czechoslovakia faced the problem of resettling those of its districts which had been inhabited by Germans. The German minority in Rumania was reported to have been largely sent to the U.S.S.R. for reconstruction work. The soviet union abolished the rights of autonomy of some of its national minorities which apparently had proved unfaithful to the soviet regime during the German occupation. They lost not only the rights of a national minority but were partly transferred to Siberia or other distant parts of the soviet union.

Minority problems also continued in southeastern Europe. Greece claimed the northern Epirus from Albania. Yugoslavia, following the example of the soviet union, tried to solve its minority problem by establishing racial equality on a federative basis. Under communist leadership a federation of the six nationalities forming Yugoslavia was established. One of these federated nationalities was Macedonia, which in turn raised the question of the future of Greek Macedonia and of Bulgarian Macedonia.

The most serious minority problem was presented by the Mohammedans in British India. In fact it was difficult to speak in this case of a minority. According to the census of 1941, India included 92,058,096 Mohammedans who showed a faster increase of population than did the Hindus. The Mohammedans demanded independence from Hindu rule and the formation of a Moslem India (Pakistan) which would include the areas in northwestern and in eastern India where Mohammedans form the majority. Thus, like other minorities and "oppressed" nationalities the Mohammedans in the Indian empire raised the demand for national self-determination. (See INDIA.)

But in a world where ever-higher forms of integration seemed desirable and necessary, national self-determination ceased to be an ideal solution. It had been shown too often in modern history that national independence neither promoted the cause of world peace nor guaranteed individual liberty and respect for legal equality and human dignity. The rights of the individual and the assurance of universal peace and constitutional progress might be more important considerations, in a world which had witnessed totalitarianism and world wars, than national independence. An international bill of rights might assure

individuals and national groups their rights and liberties within supranational federations and unions. By such measures the legitimate claims of minorities could be better safeguarded than by the redrawing of frontiers, the formation of new states or the creation of new independent nations which within themselves could harbour new minorities and create new and maybe worse minority problems.

Missions, Foreign

The decade of 1937-46 was eventful for foreign missions. The spread of Christianity among non-Christian peoples continued to be almost exclusively by Roman Catholics and Protestants (if Protestantism be made to include the Anglican communion).

World War II broke upon the foreign enterprise of both these branches of the Christian movement when they were on the ascending scale. Roman Catholics were experiencing a striking growth in several nonoccidental lands, notably in equatorial Africa, China, and the Netherlands Indies. Catholic missions were dependent chiefly upon western Europe, especially France, Germany, Italy, Spain, Belgium and the Netherlands. The Roman Catholics of the United States were taking an increasing share in the missions of their church, especially in the far east.

Protestant Christians in nonoccidental countries were steadily mounting. This was seen especially in Africa south of the Sahara, in India, in the Netherlands Indies and in China. Protestants were also rapidly increasing by conversions in several traditionally Roman Catholic lands, among which Brazil, the Philippines and Mexico were conspicuous. At the end of Dec. 1938 the (Protestant) International Missionary council held a decennial meeting at Tambarem, on the outskirts of Madras, and through it gave a striking impetus to the growth of the "younger churches," the product of 19th and 20th century missions.

To this advancing foreign missionary enterprise, World War II brought marked embarrassment. The Japanese invasion of China in July 1937 brought dislocation to the churches in most of China and distress to the Christians of Japan and Korea. Among the millions of migrants from occupied to Free China were thousands of Chinese Christians and hundreds of missionaries. Many Christians and their missionary colleagues remained in occupied China and ministered to the needs of the non-Christian population. After Pearl Harbor, British and U.S. missionaries in occupied China were interned. In Japan, the government brought increasing pressure on the churches. Protestants were constrained to form a unified "Church of Christ in

Japan," and a certain amount of co-operation between Roman Catholics and Protestants was enforced. Even before Pearl Harbor, Christians were required to join in the observances of state Shinto, and foreigners in all administrative posts were replaced by Japanese. In Korea the Japanese government, fearing that the churches would be centres of disaffection, insisted that Christians go to the Shinto shrines and attempted to consolidate the churches in that land with those in Japan proper.

The outbreak of war in Europe in Sept. 1939 and the engulfment in 1940 of Norway, Denmark, the Netherlands, Belgium and France by the Germans brought serious problems to both Roman Catholic and Protestant missions. German missionaries in British and Dutch colonial possessions were interned. Financial support could no longer come to missionaries from their constituencies in Germany and German-occupied countries. Hostilities made increasingly difficult the sending of new recruits from the British Isles and the United States and the return of missionaries to their homelands for needed furloughs.

These events were harder on Roman Catholic than on Protestant missions, for the former depended more for money and personnel upon the continent of Europe than did the latter.

The Japanese advance after Dec. 1941, disrupted most of the Christian missions in Burma, Siam, Indo-China, the Malay Peninsula, the East Indies, the Philippines and some of the islands of the Pacific. Missionaries, along with other occidentals from lands at war with Japan, were imprisoned or interned. Many Christians perished in the fighting or the suffering which attended the fighting. The Japanese attempted to bring together the various Protestant denominations in the lands which they overran and to make the churches subserve the purposes of Japanese imperialism.

In the Indonesian independence movement which followed the defeat of Japan, many Christians were killed, for in Java nationalism had a fanatical anti-Christian Moslem phase.

In spite of these handicaps, and in part because of them, Christian missions displayed vitality in adjusting themselves to the situation and in continuing.

The Roman Catholics of the United States in part made up for the loss of financial support from Europe. Moreover, kept out of large parts of east Asia by the Japanese, American Roman Catholic missionaries began going to Latin America, either to the non-Christian Indians or to care for the nominally Christian elements of the population. In 1945 the pope gave vivid demonstration of the world-wide character of the church by placing a Chinese in the list of new cardinals. The indigenous clergy and episcopate, already prominent, became more important. In China and in equatorial Africa the totals of Roman Catholics seemed to persist in their advance.

Through the International Missionary council Protestants cared for missionaries cut off from their constituencies. The International Missionary council brought into being the Orphaned Missions fund. Through this fund, contributions from Great Britain and North America were distributed to missionaries of German or German-occupied lands regardless of their denominational affiliations. So far as the administrators of the fund could learn, no unit of missionary work was discontinued from lack of money.

Moreover, in several areas, Protestantism was actually strengthened during the war. This was true in Free China,

e.g., the large influx from occupied China led to the founding of congregations, the transfer of Christian schools and the undertaking of new enterprises among non-Christians. Some of this was temporary and would not continue after the refugees had returned to their former homes. Some seemed to be more permanent. Even in many parts of occupied China the churches grew in numbers and in self-support in spite of inflation. Yet leaders were weary and some perished. Protestants from the United States, like Roman Catholics from that country, gave more attention to Latin America. The difficulties of travel made large accessions to missionary staffs difficult, and Roman Catholic leaders in the United States vigorously denounced what seemed to them trespassing on territory which was rightly theirs. But Protestantism continued to advance in much of Latin America, especially in Brazil.

In the course of the war, gifts to missions continued in Germany and in some of the lands occupied by Germany, notably in the Netherlands. The funds so gathered could not be sent out of the country, but they were evidence of a persistence in missionary purpose. In the Netherlands, candidates for missionary service were recruited and trained against the day when the way would once more be opened to send them.

The end of World War II did not bring a restoration of *ante bellum* conditions. These had gone forever. In some areas, especially in the Netherlands East Indies, political unrest made the task of missions difficult. In some others, such as Burma and large parts of China, internal disorder retarded the renewal of missionary staffs. In parts of India nationalist agitation rendered the place of the foreign missionary uncomfortable.

However, measures were taken to rebuild and to improve on earlier methods and plans. Large numbers of new missionaries were sent out, especially from the United States. Many old missionaries returned to their stations. The Japanese appeared to be singularly open to the Christian message, but destruction of church buildings had been heavy and it was only slowly that permission for the return of missionaries was obtained. Efforts were made by the Christian forces to relieve the widespread famine in India and China. Co-operation between Protestant denominations had been improved during the war, and that advance continued after hostilities ceased. To the International Missionary council was added the World Council of Churches. The constitution for this body was drafted in the spring of 1938. While it had not formally come into being by the end of the decade 1937-46, it was actually functioning. More than 90 churches had joined it. Most of these were Protestant, but there were a few of the old Catholic and Orthodox bodies as well. While most of the "younger churches" in nonoccidental lands were not yet included, and the World Council of Churches was primarily American and European, plans were being prepared to give the nonwestern Protestant bodies larger participation.

Mississippi

A southern state of the United States, Mississippi was admitted to the Union in 1817 and is popularly known as

the "Magnolia state." Area 47,716 sq.mi., of which 296 sq.mi. are water. Population (1940) 2,183,796, of which 432,882 or 19.8% was urban. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,177,324 native born; 6,472 foreign born. On July 1, 1944, the bureau of census estimated the population at 2,175,877. Capital, Jackson (62,107). Other cities: Biloxi (17,475); Greenville (20,892); Gulfport (15,195); Hattiesburg (21,026); Laurel (20,598); Meridian (35,481); Natchez (15,296); Vicksburg (24,460).

During the decade 1937-46 Mississippi retained its tradition of voting a solidly Democratic ticket. For the period 1936 to 1940 the principal officers of the state were: governor, Hugh L. White; lieutenant governor, J. B. Snider; secretary of state, Walker Wood; attorney general, Greek L. Rice; state tax collector, James B. Gully; treasurer, Newton James; superintendent of education, J. S. Vandiver; presiding officer of the senate, Lieutenant Governor J. B. Snider; presiding officer of the house of representatives, Fielding L. Wright. In the 1936-40 period the state senate had 49 members in addition to the presiding officer; the house of representatives had 139. In the membership of the legislature farmers predominated with a total of 89 in the two houses; lawyers, 51; teachers, 45; merchants, 14; insurance agents, 12; with 22 other occupations represented by from 9 to 2 members.

The units of local government for practically all purposes of the state continued to be the counties and supervisors' districts, the term of all state and county officers four years, except for the six members of the state supreme court (elected for eight-year terms).

For the period 1940-44 the principal state officers elected were: governor, Paul B. Johnson; lieutenant governor, Dennis Murphree; secretary of state, Walker Wood; attorney general, Greek L. Rice; tax collector, Carl N. Craig; treasurer, Lewis S. May; superintendent of education, J. S. Vandiver; presiding officer of the house of representatives, Sam E. Lumpkin. In the membership of the legislature (1940-44) farmers predominated with a total of 67 in the two houses; lawyers, 59; teachers, 23; merchants, 9; insurance agents, 5; and representation from 13 other occupations. In the presidential election of 1940 the distribution of votes in the state was as follows: Democratic 168,267, regular Republican 2,814, Independent Republican 4,549, Socialist 193.

In 1942 the constitution of 1890 was amended to provide for a constitutional board of trustees for institutions of higher learning and in reference to the sale and lease of 16th section lands. The chief accomplishments of the legislative session of 1942 were slightly decreased tax rates, increased support for pensions and education, provision for a compilation of the general statutes of the state and the establishment of a reformatory for Negro juvenile delinquents, a board of pardons, a state civilian defense council and a vocational school for the adult blind.

In the Aug. 24, 1943, primary Thomas L. Bailey was elected governor with 143,153 votes as against 125,882 received by Martin S. Conner, former governor. For 1944-48 the elected officers of the state, chosen in the Democratic primary, were: governor, Thomas L. Bailey; lieutenant governor, Fielding

L. Wright; secretary of state, Walker Wood; attorney general. On Dec. 26, 1943, Governor Paul B. Johnson died at his home in Hattiesburg, and was immediately succeeded by Lieutenant Governor Dennis Murphree.

The results of the presidential election in the state, Nov. 7, 1944, were as follows: Democratic votes 158,515, Independent Republicans 7,859, Republicans 3,742.

For 1944-48 the elected officers of the state, chosen in the Democratic primaries in Aug. 1943, and in the general election of that year, were: governor, Thomas L. Bailey; lieutenant governor, Fielding L. Wright; secretary of state, Walker Wood; attorney general, Greek L. Rice.

Gov. Bailey died Nov. 2, 1946, and Lt. Gov. Wright succeeded to the office, to serve until Jan. 1948. Oscar Wolfe became presiding officer of the state senate until Jan. 1948. (W. D. McC.; C. Cs.; A. B. Bu.; X.)

184 Missouri

A west north central state of the United States, Missouri was admitted to the Union in 1821; popularly known as the "Show Me" state. Area 69,674 sq.mi., of which 404 are water. Pop. (1940) 3,784,664 (51.8% urban, 48.2% rural); 3,425,062 (90.5%) native white, 114,125 (3%) foreign-born white and 244,386 (6.5%) Negro. On July 1, 1944, the bureau of census est. the pop. at 3,589,538. Capital, Jefferson City (1940, 24,268). Largest cities: St. Louis (816,048), Kansas City (399,179), St. Joseph (75,711), Springfield (61,238).

Principal state officers for the 1936-40 period were: governor, Lloyd C. Stark; lieutenant governor, Frank G. Harris; secretary of state, Dwight H. Brown; auditor, Forrest Smith; treasurer, R. W. Winn; attorney general, Roy McKittrick; superintendent of schools, Lloyd W. King. Missouri's representation in congress consisted of two Democratic senators (Bennett Champ Clark and Harry S. Truman), 12 Democrats and 1 Republican in the house of representatives. The vote for governor in 1936 was Stark (Dem.) 1,037,133 and Barrett (Rep.) 772,934.

The 1938 election did not lessen the numerical preponderance of the Democratic party's membership in congress.

The outstanding event of 1939 was the crippling of the powerful Pendergast political machine (Democrat), previously weakened by federal convictions growing out of the 1936 election frauds. Gov. Stark's appeals to Pres. Roosevelt instigated action by the U.S. treasury and justice departments, which, following U.S. District Attorney Milligan's efficient prosecutions for income tax evasion, resulted in the imprisonment at Leavenworth of boss Thomas J. Pendergast and four of his henchmen. The state then broke the machine's control over the Kansas City police, and helped federal authorities in destroying its influence in the WPA in Missouri. The 60th session of the general assembly (Jan. 4-June 24, 1939), voting about \$232,000,000 for various purposes, appropriated more money than any assembly in the state's history. Among the more important laws enacted were: placing the Kansas City police department under control of a board consisting of the mayor and four commissioners; making need the determining factor in granting old-age assistance; lowering old-age assistance eligibility from 70 to 65; extending the 2% sales tax until Dec. 31, 1941; directing Lincoln university to provide Missouri Negroes "opportunity for training up to the standard furnished" by the University of Missouri.

During 1940 Missouri was the scene of several political battles. They began when U.S. Sen. Clark clashed with Gov. Stark for control of the Democratic state convention. Clark was the victor; the convention, dominated by the Dickmann-Hannegan machine, the "courthouse rings," and the remnants of the Pendergast machine, adopted a platform barely mentioning Stark's administration. The same factions were again victorious in the Democratic primary on Aug. 6. Gov. Stark and former U.S. District Attorney Milligan both entered the senatorial race but were defeated by U.S. Sen. Truman, incumbent. In the November election the Republican candidate, Forrest C. Donnell, with the support of his own party and some of the antimachine Democrats, defeated the Democratic candidate, Lawrence McDaniel, by a plurality of 3,613. The rest of the principal state officers elected were Democrats: Frank G. Harris, lieutenant governor; Dwight H. Brown, secretary of state; Forrest Smith, auditor; Wilson Bell, treasurer; Roy

S. McKittrick, attorney general. Elected to the state senate were 28 Democrats and 6 Republicans, to the house of representatives 85 Democrats and 65 Republicans. A constitutional amendment was adopted providing for a nonpartisan system for the nomination, appointment and election of judges of certain courts.

The popular vote for president was Roosevelt 958,476; Willkie 871,009; for U.S. senator, Truman (Dem.) 930,775, Davis (Rep.) 886,376. Congressmen elected included 10 Democrats and 3 Republicans.

The 61st session of the general assembly (Jan. 8-July 12, 1941) remained in session longer than any previous assembly. Controlled by the Democrats, it attempted to prevent the inauguration of Gov. Donnell (Rep.); but on Feb. 26, as the result of a state supreme court decision, Donnell was inaugurated. Then the assembly, on petition of the unsuccessful Democratic candidate, Lawrence McDaniel, ordered a recount of the gubernatorial vote. On May 21, with the recount about half finished and with Donnell's plurality considerably increased, the assembly, at McDaniel's request, dismissed the contest. The legislature also enacted laws establishing a state defense council, a secret ballot and the control of congenital syphilis. In addition, it resolved to submit two constitutional amendments to the electorate in 1942: one to repeal the nonpartisan court amendment, the other to increase the pay of members of the legislature.

In the election of Nov. 3, 1942, the Republicans made substantial gains in Missouri. Eight Republicans and five Democrats were elected to the U.S. house of representatives, a gain of five seats. For the state senate 18 Democrats and 16 Republicans were elected (a Republican gain of 10 seats), and 95 Republicans and 55 Democrats were elected to the house (the first Republican majority since 1928). The voters approved a constitutional amendment to increase the pay of the legislature but rejected an amendment to repeal the nonpartisan court amendment. They also approved a proposed convention to revise the state constitution. During a special session of the assembly the governor asked for appropriations of about \$2,536,020, to provide funds for state departments and institutions for the remainder of 1942. However, the assembly appropriated \$5,203,469, adding funds for deficiencies previously incurred by some of these agencies. Donnell maintained that appropriations for such deficiencies were unconstitutional. He therefore vetoed these items and approved appropriations amounting to only \$2,335,653.

The 1943 regular session of the general assembly appropriated more than \$255,000,000 for the 1943-44 biennium, the largest sum in Missouri's history. Laws were enacted providing for a three-day waiting period for the issuance of marriage licences; serological tests for marriage licence applicants; a revision of the civil procedure and corporation codes; a permanent joint committee on legislative research; the establishment of teachers' pension and retirement funds by the three largest cities; a soil conservation commission; a revision of the state food and drug laws; an absentee ballot for members of the armed forces. The assembly defeated the governor's proposals to establish a state merit system and consolidate the state's tax collection agencies.

The legislature proposed two constitutional amendments: the first, approved by the voters at a special election on April 6, 1943, provided that all laws, except appropri-

Audience of more than 10,000 persons singing the U.S. national anthem before the start of an outdoor performance at the St. Louis Municipal opera, St. Louis, Mo., in July 1942. Darkened stage can be seen in foreground

ation laws, should become effective 90 days after enactment; the second, to be passed on by the voters in 1944, would give the legislature power to direct the investment or disbursement of county school funds for public school purposes. At the special election on April 6 the voters chose 83 delegates to a convention to revise the state constitution.

A special session of the legislature March 15-April 8, 1944, appropriated \$3,180,000 for the social security program, and liberalized the statutes regulating the absentee ballot for members of the armed forces. The constitutional convention, in session Sept. 21, 1943, to Sept. 29, 1944, drafted a new state constitution, to be submitted to the voters in 1945. The leading members of the convention were: Robert E. Blake (pres.), Allen McReynolds, Charles H. Mayer, Ethan A. H. Shepley, William L. Bradshaw, Franc L. McCluer, Guy B. Park and Richard S. Righter.

Robert E. Hannegan, of St. Louis, was elected chairman of the Democratic National committee in Jan. 1944. At the Democratic National convention on July 21, 1944, Sen. Harry S. Truman received the nomination for vice-president. The popular vote for president was Roosevelt 807,357, Dewey 761,175; for U.S. senator, Forrest C. Donnell (Rep.) 778,778, Roy McKittrick (Dem.) 776,790.

In the state election, Nov. 7, 1944, Phil M. Donnelly (Dem.) defeated Jean Paul Bradshaw (Rep.) by a plurality of 30,489 votes, for the office of governor. The other state officers elected were also Democrats: Walter N. Davis, lieutenant governor; Wilson Bell, secretary of state; Forrest Smith, auditor; Robert W. Winn, treasurer; J. E. Taylor, attorney general. As a result of the election, both houses of the state legislature were Republican, the house consisting of 80 Republicans and 70 Democrats, the senate of 19 Republicans and 15 Democrats.

The outstanding political event in Missouri during 1945 was the adoption of the new constitution on Feb. 27, by a vote of 312,032 to 185,658. The new constitution provided, among other things, for a central revenue bureau, a department of public health and welfare, a commissioner

of education selected by a bipartisan board of education, taxation of intangible personal property on the basis of yield, elimination of the fee system for remunerating most state and county officers, magistrate courts with practising lawyers as judges, decennial reapportionment of state senatorial districts, reorganization of county governments, voluntary consolidation or division of counties, a public record of votes on bills by members of legislative committees and state financial support of public libraries.

The work of implementing the provisions of the new constitution fell to the 63rd general assembly, which convened on Jan. 3, 1945, with Republicans in control of both houses. During 1945 there were other events of political importance. On April 12 Vice-Pres. Harry S. Truman succeeded Franklin D. Roosevelt as president of the United States, the first native-born Missourian to hold that office. On Jan. 12 the governor appointed Frank P. Briggs (Dem.) to succeed vice-president elect Truman as U.S. senator.

The 63rd general assembly (Jan. 3, 1945-Dec. 12, 1946) was in session 23 months and 10 days—the longest session on record—although the house met on only 230 legislative days and the senate on 253. Besides passing laws implementing the new constitution, the general assembly enacted legislation providing for the extension of the merit system of personnel administration.

In the election of Nov. 5, 1946, the Republicans made substantial gains. The popular vote for U.S. senator was James P. Kem (Rep.) 572,556; Frank P. Briggs (Dem., incumbent) 511,544. Nine Republicans and four Democrats were elected to the national house of representatives, a Republican gain of three seats. The Democratic candidate from Pres. Harry S. Truman's home district, who was supported by the president, was defeated. The Republicans retained control of both houses of the state legislature.

Admiral Mitscher, commander of task force 58, switching to another warship via bosun's chair from his flagship, the carrier "Bunker Hill," which lay blazing from the hits of two Japanese suicide planes off Okinawa on May 11, 1945

Mitscher, Marc Andrew

Mitscher (1887–), U.S. naval officer, was born Jan. 26, 1887. He entered the navy in 1906, joined the naval air force in 1915 and had advanced through the grades to vice-admiral by 1944. He was in command of the aircraft carrier "Hornet" when that vessel carried Gen. "Jimmy" Doolittle's army bombers within 800 nautical mi. of Japan to bomb Tokyo on April 18, 1942. Mitscher's carrier task force participated in the battle of Midway in June 1942, the air attacks on Guadalcanal in 1943 and virtually every important naval operation in the Pacific war theatre in 1944 and 1945. In June 1944 Mitscher was selected to command task force 58, then described as the "most powerful and destructive naval unit in the history of sea warfare." During that year Mitscher's force took part in the Marshalls invasion, the attack on Truk, the Marianas invasion, the battle of the Philippine sea, the Luzon and Formosa raids and the battle for Leyte gulf. In March and April of 1945, the carrier planes of Mitscher's task force slashed targets in Japan and the Ryukyus. Mitscher was relieved as commander of the 1st carrier force in July 1945, and was returned to Washington, D.C., as deputy chief of naval operations for air. In Jan. 1946 he was made commander of the 8th fleet in the Atlantic.

Molotov, Vyacheslav Mikhailovich

Molotov (1890–), soviet statesman, was educated at Petersburg polytechnic and during his youth organized bolshevist student groups and worked for the newspaper *Pravda*. The revolution of Feb. 1917 found him a member

of the Petrograd soviet executive committee. In 1920 he was appointed secretary of the central committee of the Communist party of the Ukraine, and the following year he held this office for the whole of the U.S.S.R. He was named president of the soviet of people's commissars in 1930. In May 1939 Molotov succeeded Maxim Litvinov as foreign commissar, an appointment which foreshadowed the shift in soviet foreign policy leading to the nazi-soviet pact of nonaggression, signed by Molotov in Moscow on Aug. 24, 1939. He resigned as premier of the U.S.S.R. in May 1941 and was succeeded in this office by Stalin; he remained as foreign commissar, however, and took over the vice-premiership. Three weeks after the German invasion of the U.S.S.R., Molotov signed, on July 13, 1941, the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. In Aug. 1942 Molotov was named vice-chairman of the people's council of commissars.

Molotov attended most of the major international conferences held among the Allied leaders between 1942 and 1946, including the Moscow parleys in 1944 and the Yalta meeting and San Francisco conference in 1945. As soviet representative at the foreign ministers' conferences which met in Paris in June and July of 1946 to draft proposals for the peace treaties, and at the peace conference itself which followed, Molotov frequently clashed on matters of policy and procedure with James F. Byrnes, the U.S. representative, and Ernest Bevin, British foreign secretary.

Molybdenum

The United States remained the world's foremost producer of molybdenum during the decade 1937–46. From 91% of the world total in 1939, the percentage increased to more than 93% in 1941, but declined to 87% in 1944, as other countries responded to war demand. Mexico and Chile led among the minor producers.

Molybdenum was undergoing a spectacular boom in production even before it was still further expanded by the demands of World War II. Output increased tenfold between 1925 and 1935, and tripled between 1935 and 1939. The peak war output in 1943 was double that of 1939, a change which in comparison with the tripling in the preceding four years, actually marked a slackening of the previous rate of increase. The impact of the war on molybdenum demand was really double-barrelled, as the industry not only had to supply a greatly increased amount to meet the expanding consumption in the normal uses of the metal, but also large amounts to serve as a substitute for tungsten.

At the same time that molybdenum production reached its peak in 1943, tungsten also was more plentiful, and between then and the end of the war the consumption demand dropped by about one-half. Another slackening of demand followed the end of the war in Europe, and a still further drop after the surrender of Japan. During the

Monaco

A principality situated on the Mediterranean, Monaco is surrounded on the landward side by the French department of Alpes Maritimes. Area, 370 ac. (0.59 sq.mi.). Population (census, 1939), 23,973 (Italians 9,724; French 8,540; British 1,902; United States 270; Monegasques 1,761; others 1,776). Towns: La Condamine (pop. 11,341); Monte Carlo (10,683); Monaco (1,940). The ruler of Monaco throughout the decade 1937–46 was Prince Louis II, who had succeeded on June 26, 1922; he was aided by a national council of 12 members elected for 4 years.

The effect of the outbreak of World War II on Monaco's tourist trade was to present it with a budgetary deficit of £62,500, which meant that for the first time its citizens were threatened with the imposition of income tax. It was estimated, however, that the state could live on its reserve fund of £227,000 for a period of two and a half years.

In spite of Italian claims after the fall of France, Monaco remained a French protectorate, and British residents were allowed to remain. French citizens were allowed to enter the state for a visit limited to one fortnight. By the end of 1942, German and Italian troops were stationed in the principality, which had become a curious oasis in war-stricken Europe, where food and goods unobtainable elsewhere on the continent could be had at high cost.

In Sept. 1942 the prince of Monaco rejected an Italian demand that a blackout be imposed. A German diplomatic representative was installed in Monaco in Aug. 1943, for the first time since 1906. With the threat of Allied invasion early in 1944 all foreigners were ordered to leave by March 15, but on Dec. 17 after the liberation of France, it was announced that they would be allowed to remain for an indefinite period.

On June 23, 1944, the Princess Charlotte, heir to the throne, renounced her rights in favour of Prince Rainier, her son.

Monaco's neutrality was strictly observed by the Germans, and the only damage to its buildings was inflicted by one bomb. At the end of the war plans were started for restoring the peacetime tourist industry. The International Sporting club and seasons of opera and ballet in the old Monte Carlo tradition were reopened.

On July 24, 1946, Prince Louis married Mlle. Ghislaine Dommanges, a naturalized citizen of Monaco. (J. R.A.)

Monazite

Most of the world's supply of monazite, the chief source of thorium, cerium and the other rare earth metals, continued to be beach deposits on the coasts of Brazil and India, with smaller amounts from Netherlands East Indies. The United States consumption was met entirely from imports, which were as follows, in short tons of gross weight, the actual monazite content not being specified:

	1937	1939	1941	1943	1945
Gross imports	336	1,560	3,448	4,980	549
Brazil	336	54	734	1,911	437
India	..	1,336	2,714	3,033	112
Neth. East Indies	..	170

An iron alloy of the rare earth metals was the spark producer in the pocket lighter, and thorium had long been used in gas mantles; oxides were used in polishing glass and other compounds in the mildew-proofing of textiles. But these and numerous other uses were dwarfed by the possible use of thorium in atomic fission. (G. A. Ro.)

Mongolia

Geographically and politically, Mongolia is divided by the Khalka river into Outer Mongolia, with an area of approximately 622,744 sq.mi., and Inner Mongolia, with an area of approximately 334,100 sq.mi.

Outer Mongolia, a territory of about 850,000 population, assumed international significance in 1921 when a tsarist refugee from the Russian Revolution of 1917, Michael von Ungern-Sternberg, made the city of Urga in Outer Mongolia a base of operations against soviet Russia. Later, soviet troops moved into Outer Mongolia, captured Urga, which was renamed Ulan Bator Khoto, and remained there until May 1, 1925. In 1924, a republic of Outer Mongolia made its appearance, and was promptly recognized by the soviet union through the Soviet-Mongolian Treaty of Friendship of Nov. 5, 1921. On the date of the withdrawal of soviet troops, "the Mongol working people and its government" declared that Outer Mongolia and the soviet union "are bound by an unseverable community of fate, interests, and the great ideas of real rule by the people," and that "in difficult moments" the republic will "firmly trust in the aid of the U.S.S.R. and the Red army."

This state of affairs was viewed with considerable alarm by China. After protracted negotiations, a Sino-Soviet treaty was concluded on May 31, 1924, article v of which provided that "the Government of the U.S.S.R. recognizes that Outer Mongolia is an integral part of the Republic of China and respects China's sovereignty therein." The same article also provided for "the complete withdrawal of all the troops of the U.S.S.R. from Outer Mongolia."

In spite of this treaty, however, a "gentlemen's agreement" was supposed by the U.S.S.R. and Outer Mongolia to have existed between them after Nov. 27, 1934. On the basis of this agreement, the soviet union and Outer Mongolia further concluded, on March 12, 1936, a Protocol of Mutual Assistance, pledging consultation and co-operation in case of danger of attack, including military assistance.

The Chinese government immediately filed a protest against this protocol, basing it upon article v of the Sino-Soviet treaty of 1924. Maxim Litvinov, on behalf of the U.S.S.R., rejected China's protest, although he again affirmed China's sovereignty over Outer Mongolia.

The outbreak of war between China and Japan on July 7, 1937, brought about a treaty of nonaggression between China and the U.S.S.R., concluded on Aug. 21, 1937. During the negotiations of this treaty, the question of Outer Mongolia was discussed, although no mention of the territory was made in the provisions.

Outer Mongolia again assumed international importance when the Soviet-Japanese Neutrality pact of April 13, 1941, was announced. This pact included a declaration which said that the soviet union and Japan "solemnly declare

that the U.S.S.R. pledges to respect the territorial integrity and inviolability of Manchoukuo, and Japan pledges to respect the territorial integrity and inviolability of the Mongol People's Republic."

It will be recalled that the treaty of 1924 between China and the U.S.S.R. specifically stipulated that Outer Mongolia was "an integral part" of China and was so regarded by the soviet union. It will also be recalled that "Manchoukuo" had always been regarded by China and by the rest of the world except the axis powers as a Japanese puppet state. This exchange of pledges between the soviet union and Japan of two territories forming integral parts of China was naturally strongly resented by China and such other nations as the United States which refused to recognize "the fruits of aggression." On its part, the Chinese government promptly issued a formal statement declaring that "the Chinese government and people cannot recognize any engagements entered into between third parties which are derogatory to China's territorial and administrative integrity, and wish to state that the Soviet-Japanese declaration just announced has no binding force whatsoever on China."

During the Yalta conference in Feb. 1945, Outer Mongolia was a subject of discussion between President Roosevelt, Prime Minister Churchill and Marshal Stalin. It was agreed between them that "the *status quo* in Outer Mongolia (the Mongolian People's Republic) shall be preserved," and that President Roosevelt would take measures in order to obtain the concurrence of Generalissimo Chiang Kai-shek on advice from Marshal Stalin regarding the agreement concerning Outer Mongolia. This part of the agreement was made public after the death of President Roosevelt and the defeat of Japan.

The agreement, however, was communicated to the Chinese government immediately after its conclusion. The matter was taken up during the series of conversations between China and the soviet union in Moscow during the spring of 1945, which resulted in the conclusion of a treaty of friendship and alliance between the two nations. In an exchange of letters between the foreign ministers of the two countries, the Chinese foreign minister declared that "in view of the desire for independence repeatedly expressed by the people of Outer Mongolia, the Chinese government declares that after Japan's defeat, if a plebiscite of the people of Outer Mongolia confirms this desire, the Chinese Government will recognize the independence of Outer Mongolia in her existing boundaries." Foreign Commissar Molotov declared, in reply, that the soviet government "will respect the state of independence and territorial integrity of the Mongolian People's Republic."

On Oct. 20, 1945, a plebiscite was held by the people of Outer Mongolia. The Chinese government dispatched an official to observe the plebiscite proceedings; 483,291 votes were reported cast in favour of independence, none against. On Jan. 5, 1946, the Chinese government formally announced that "the result of the plebiscite has confirmed that the people of Outer Mongolia are in favour of independence" and that "this government now recognizes the independence of Outer Mongolia."

In June 1946, the government of Outer Mongolia applied for membership in the United Nations. In the official cable, the prime minister of Outer Mongolia reminded the United Nations "that the people of the Mongolian People's Republic took part in the struggle against Fascist states on the side of the United Nations, having contributed to the struggle by the material resources it had placed at the disposal of its great neighbour, the Soviet Union." The application was taken up during the summer of 1946

but was rejected by the Security council.

Inner Mongolia is a geopolitical term describing an area within the territorial confines of China. In this area, the ancient politico-religious system of "League" (Meng) and "Banner" (Ch'i) still obtained. Upon this system, the Chinese government superimposed an administrative system of provinces and districts similar to that in other parts of the country.

After the outbreak of war between China and Japan in 1937, the Japanese tried very hard to win the Mongols over. Their area was strategically important, being the shortest international highway between soviet Siberia and north China.

Many Mongol princes defended their land against the Japanese invasion, fighting valiantly on the side of the Chinese government troops. The Japanese persisted, however, to appeal to their aspirations for independence.

In 1936, one of the important Mongol princes, Prince Teh (known as Teh Wang to the Chinese), joined the Japanese. After many reorganizations, the Japanese finally organized the Meng Chiang Tse Chih Cheng Fu, or Mongol Borderland Self-governing government, presided over by Prince Teh, with the capital in Hoko Hoto. This puppet regime disappeared with the defeat of Japan.

The national government of China, through its Commission on Mongolian and Tibetan Affairs, on which Mongol princes and leaders were amply represented, had administered Inner Mongolia in accordance with the principle of nationalism as taught by Dr. Sun Yat-sen, China's revolutionary leader. As stated by Generalissimo Chiang Kai-shek, this principle meant that the government "should accord large and small racial groups inside the provinces legal and political equality, and unhindered economic and religious freedom" and "should in a friendly spirit voluntarily help them to realize their freedom." (C. CN.)

Montana

A northwestern state of the United States, Montana is popularly known as the "Treasure state." Area 147,138 sq.mi.; population (1940) 559,456. The urban population was 211,535 or 37.8%; there were 540,468 whites, of whom 484,826 were native-born and 55,642 were foreign-born. The Indian population numbered 16,841. Capital, Helena (15,056). Other cities: Butte (37,081); Great Falls (29,928); Billings (23,261); Missoula (18,449); Anaconda (11,004). It was estimated that the population of the state had gone up 40,000 or 50,000 after 1944 (the population was estimated at 464,999 on July 1, 1944).

Roy E. Ayers was elected governor in 1936; Sam Mitchell, secretary of state; Harrison Freeborne, attorney general. In 1938, Jerry J. O'Connell, liberal Democrat, was defeated for re-election to congress. Politics centred on redistribution of tax burdens, improved working conditions, water conservation and irrigation and extension of social security. Farm and labour groups controlled the legislature.

In the quadrennial election of 1940, Sam C. Ford was elected governor (the first Republican governor in 20 years), with a Republican senate and a Democratic house of representatives. Other state officers elected were: Ernest T. Eaton (Rep.), lieutenant governor; Sam Mitchell (Dem.), secretary of state; John J. Holmes (Dem.), audi-

tor; Thomas Carey (Dem.), treasurer; John W. Bonner (Dem.), attorney general; Elizabeth Ireland (Rep.), state superintendent of public instruction, Paul T. Smith (Dem.), railroad commissioner.

Jeannette Rankin (Rep.) and James F. O'Connor (Dem.) were elected representatives to congress. Senator Burton K. Wheeler (Dem.), was chosen for a fourth term in the U.S. senate. President Roosevelt carried the state in 1940 with 145,698 against 99,579 for Willkie; 1,443 for Thomas; 664 for Babson and 489 for Browder.

Measures passed by the legislative assembly in 1941 provided for a survey for reorganization of the state government, the reapportionment of congressional districts, changes in the social security law and proposed changes in the state board of education.

In the general election of 1942 the Republicans gained control of both houses of the state legislature. Mike Mansfield (Dem.) and James F. O'Connor (Dem.) were elected representatives to congress. James E. Murray (Dem.) was re-elected to the U.S. senate. Proposed constitutional amendments for changes in the state board of education and for lengthening the terms of certain county officials from two to four years were voted down by large majorities. State officials in 1942 were: governor, Sam C. Ford; Ernest T. Eaton, lieutenant governor, Sam Mitchell, secretary of state; John J. Holmes, auditor; R. V. Bottomly, attorney general; Elizabeth Ireland, superintendent of public instruction.

In 1943 the state planning board drafted a \$70,000,000 postwar public works program to aid private industry in providing jobs for returning veterans and give the state needed improvements. Highway construction, irrigation of semi-arid farm lands, extension of rural electrification and new buildings and improvements at the state institutions were listed as the main projects to be undertaken. Strenuous opposition developed throughout the state against the army engineers' plan to raise the level of Flathead lake 17 ft. or more, the chief objection being the claim that the economic and social life of some 50,000 Montana people would be disrupted.

In the quadrennial election of 1944, Ford was re-elected governor with both a Republican senate and house of representatives. Other state officials elected were: Ernest T. Eaton (Rep.), lieutenant governor; Sam W. Mitchell (Dem.), secretary of state; R. V. Bottomly (Dem.), attorney general; George P. Porter (Rep.), treasurer; John J. Holmes (Dem.), auditor; Elizabeth Ireland (Rep.), superintendent of public instruction; and Horace F. Casey (Dem.), railroad and public service commissioner. Albert H. Angstman and Edwin K. Cheadle were elected associate justices of the supreme court on a non-partisan ticket. Mike Mansfield (Dem.) and James F. O'Connor (Dem.) were re-elected representatives to congress. President Roosevelt carried the state with a vote of 112,556 against 93,163 for Dewey.

The state planning board—with the same membership as the water conservation and rural electrification boards—made notable progress in 1944 in furthering plans for postwar highway construction, irrigation, rural electrification and the construction of new buildings at the state institutions. Early construction of the authorized \$42,000,000 Hungry Horse dam was approved by state agencies, but the proposed development of the Missouri and Columbia river basins through federal control was looked upon as a sinister threat to Montana's sovereignty.

Congressman James F. O'Connor died early in 1945 and

at a special election in June, Wesley A. D'Ewart (Rep.), one of the leading opponents in the state to a Missouri Valley authority, was elected for the unexpired term.

In the 1946 elections, the veteran statesman Burton K. Wheeler, seeking a fifth term in the United States senate, was defeated in the primary by former associate justice Leif Erickson, who in turn lost in the general election to Zales Ecton (Rep.). Mike Mansfield (Dem.) and Wesley D'Ewart (Rep.) were elected representatives in congress. Paul T. Smith (Dem.) was elected railroad and public service commissioner, and Frank Murray (Dem.) clerk of the supreme court on a nonpartisan ticket. Elections for the state legislature returned strong Republican majorities in both houses.

Monte Carlo

See MONACO.

Montgomery of Alamein, 1st Viscount

Viscount Montgomery of Alamein (Bernard Law Montgomery) (1887–), British army officer, was born Nov. 17, 1887, the son of an Ulster clergyman. He joined the British army in 1908 as a second lieutenant in the Warwickshire regiment and fought in France during World War I. After the armistice, he served as a division commander in Palestine and instructor at the staff college in India. Promoted to the rank of major general in 1938, he was again assigned to Palestine and was stationed there from 1938 to the middle of 1939.

At the outbreak of World War II, Montgomery went to France as commander of the 3rd division. In June 1940, he participated in the evacuation of British troops from Dunkirk. In the summer of 1942, Montgomery, who had been made a full general, was given command of the British 8th army. On Oct. 23, of that year, he launched the celebrated offensive at El Alamein, Egypt, that resulted in the retreat of Marshal Erwin Rommel's Afrika Korps clear across the North African desert to Tunisia. Montgomery also played a major role in the conquest of Tunisia (May 1943), the Sicilian landings (July 1943) and in the initial phases of the Italian campaign (Sept. 1943).

He was later withdrawn to England in preparation for the invasion of western Europe and was field commander of Allied ground forces at the start of the Normandy landings. In Aug. 1944, Gen. Eisenhower split his land forces into two groups, with Montgomery in command of the 21st army group (mostly British and Canadian troops) and Gen. Omar N. Bradley heading the 12th army group (predominantly U.S. troops). On Aug. 31, 1944, King George VI appointed Montgomery field marshal supernumerary. In early 1945, Montgomery's forces participated in the general Allied offensive into the reich, driving through the Netherlands, northern Germany and up to Denmark. On May 4, 1945, all German armies in that area, estimated to have numbered more than 1,000,000 men, surrendered to Montgomery. He was appointed chief of the British occupation forces and member of the Allied control commission in Germany, May 22, 1945.

He was created Viscount Montgomery of Alamein on the King's New Year Honours list, Jan. 1, 1946. Montgomery later relinquished his occupation posts to become chief of the British imperial general staff, April 30, 1946. He visited Washington in Sept. 1946, declaring that he was studying U.S. army training methods. In what was regarded as a reply to criticism from U.S. writers for his alleged delays in attacking in the Caen sector after D-day in 1944, Montgomery, in an article published Sept. 4, 1946, stated that his entire campaign in France after D-day was fought exactly according to preinvasion planning.

Montreal

The principal city of Canada, Montreal is situated in the province of Quebec, on an island at the confluence of the Ottawa and St. Lawrence rivers. The population of Montreal increased, between censuses 1931 and 1941, from 810,925 to 903,007, and for greater Montreal, including its suburbs, from 973,637 to 1,105,359. In 1945, as estimated by *Lovell's Directory*, the population of the city proper was 1,345,000 and of greater Montreal 1,554,000.

The assessed value of real estate for the year 1945 was \$1,281,313,440, of which \$937,763,173 was taxable and \$343,550,267 exempt from taxation. In 1945, building per-

mits were issued for 1,934 new projects with a value of \$16,532,935, and for 2,425 repair jobs having a value of \$5,370,913.

In May 1943 the city defaulted in respect of the principal of certain bonds which became due, but continued to pay interest. A reorganization of the city's finances was effected through the Quebec Municipal commission, which was placed in charge of any municipality defaulting in respect of its bonds. The reorganization was completed, and the control of the Quebec Municipal commission was removed.

The form of government of the city was changed in 1940 from a council consisting of 35 aldermen and a mayor to a municipal council consisting of 99 members, of whom one-third was appointed by certain recognized public bodies, one-third elected by the proprietors alone and one-third elected by the proprietors and tenants, or occupants, of immovable property. The mayor was elected by the citizens generally. The administration of the city remained in the hands of an executive committee chosen by the council, consisting of six members.

In the spring of 1939, King George VI and Queen Elizabeth paid an official visit to the city and signed the Golden Book, the official register of distinguished visitors. They were given a great ovation.

In 1940 the mayor publicly advised the citizens not to comply with the law of the federal government requiring registration of all citizens, for war purposes. He was arrested and confined in a concentration camp but was liberated in 1944 and was subsequently re-elected mayor.

Public education in the city continued to be divided between a Catholic commission and a Protestant commission. The Montreal Protestant Central school board, organized in 1925, received jurisdiction over Montreal proper and the school boards of adjoining municipalities.

In 1940 the rate of taxation on property owned by Roman Catholics was increased from 7 mills to 10 mills, the same as that imposed upon Protestant proprietors. Incorporated companies continued to pay school tax, at the

King George VI signing the city's Golden Book at Montreal, Canada, in May 1939, as Mayor Camillien Houde stood by

rate of 12 mills, into a neutral panel divided between the Roman Catholic and Protestant school commissions. Jewish children attended the Protestant schools. The cost of their education, in excess of the amount paid in taxes by Jewish proprietors, was charged against the neutral panel before division. Both Roman Catholic and Protestant commissions operated at a deficit during the decade. The situation was the subject of elaborate study, notably in the case of the Protestant commission, by a committee headed by W. G. Hepburn.

In 1946, an act of the provincial legislature gave authority to the Catholic school commission to annex and absorb the school municipality of Montreal East. This project was strongly opposed by lay and ecclesiastical authorities and had not been carried into effect by the end of the decade.

Mooney, Edward

Cardinal Mooney (1882–), archbishop of Detroit, was born at Mt. Savage, Md., on May 9, 1882, and was ordained priest in 1909. Later he taught at St. Mary's seminary in Cleveland, O., served as head of the Cathedral Latin school from 1916 to 1922, and was spiritual director of the North American college in Rome until Jan. 1926. He was then elected titular archbishop of Irenopolis and named apostolic delegate to India. The first U.S. priest to be given a permanent appointment in the diplomatic service of the holy see, he was later transferred to Japan in the same capacity. An important accomplishment of his five years as delegate to India was the settlement of the so-called "double jurisdiction" question, effected through an accord between the holy see and Portugal. On Aug. 28, 1933, he was named bishop of Rochester, N.Y. With the exception of one year, he held the post of chairman of the conference of the administrative board of the National Catholic Welfare conference from 1935 to 1945. On June 1, 1937, the diocese of Detroit was elevated to the rank of an archiepiscopal see, and the entire state of Michigan was made into a new ecclesiastical province with Archbishop Mooney as its first archbishop. On Feb. 18, 1946, he was proclaimed a cardinal by Pope Pius XII.

Moravia

See CZECHOSLOVAKIA.

Morgan, Arthur Ernest

Morgan (1878–), U.S. engineer, educator and public official, was born on June 20, 1878, at Cincinnati, O. From 1920 to 1936 he was president of Antioch college, Yellow Springs, O., where he instituted the co-operative plan of education of alternate study and work. He was appointed chairman of the Tennessee Valley authority in 1933 and was dismissed by President Roosevelt in March 1938 after a split in the TVA directorate. A suit filed by Morgan charging the illegality of the dismissal was denied by the supreme court in 1941. Among Morgan's later publications were *The Small Community* (1942) and *Edward Bellamy* (1944).

Morgan, Sir Frederick Edgworth

Sir Frederick Morgan (1894–), British army officer, was born Feb. 5, 1894. He was commissioned as a second lieutenant in the royal artillery in 1913 and was sent to

the western front the following year. In 1916, he was appointed a staff captain. He attended the Staff college at Camberley and was a brigade major at the Staff college at Quetta, India. On his return to England in 1936, Sir Frederick was assigned to the war office as a general staff officer. Named to the temporary rank of a brigadier in Aug. 1939, he went overseas in 1940 as commander of a support unit in an armoured division. Just prior to the collapse of France, he returned to England with his unit. In May 1942, he was promoted to the rank of lieutenant general and in April 1943, he was assigned to study and plan the project for the Allied invasion of western Europe. After the war, he was named (Sept. 1945) chief of operations for U.N.R.R.A. in Germany. On Jan. 2, 1946, he was criticized for having made a statement that displaced persons of Jewish origin were "well-dressed, well-fed and rosy-cheeked." This remark and other parts of his statement were branded as anti-Semitic and he was suspended, pending a review of his case. However, he was later cleared by Herbert Lehman, director general of U.N.R.R.A., who asserted that he was satisfied that Morgan did not intend to impute sinister motives to the D.P.'s or the organizations helping them, and that he did not have religious prejudices. Subsequently, Gen. Morgan alleged that the soviet union was using D.P. camps for espionage. Fiorello La Guardia, who succeeded Lehman as U.N.R.R.A. director general, said he had found no evidence to substantiate these charges, and on Aug. 20, 1946, Sir Frederick was removed from his post.

Morgan, (John) Harcourt Alexander

Morgan (1867–), U.S. entomologist and public official, a native Canadian, was born in Strathroy, Ont., on Aug. 31, 1867. After receiving the degree of bachelor of agricultural science at the University of Toronto in 1889, he went to Louisiana State university, where he was entomologist, zoologist and horticulturist. In 1904–05 he directed the state's program for the extermination of the cattle tick and the boll weevil. From 1905 until 1919 Morgan was director of the Tennessee agricultural experiment station and professor of zoology and entomology at the University of Tennessee. He had been appointed dean of the University of Tennessee college of agriculture in 1913, and in 1919 he was named president of the university. President Roosevelt appointed him to the board of directors of the Tennessee Valley authority in 1933. When Arthur E. Morgan was dismissed by Roosevelt on March 22, 1938, Harcourt Morgan was appointed to the chairmanship of the TVA. In Sept. 1941 David E. Lilienthal succeeded him as chairman, and Morgan assumed the post of vice-chairman.

Mormons

Membership of the Mormons (legal name for The Church of Jesus Christ of Latter-day Saints) increased during the 1937–46 decade by 218,764, to a total membership in 1946 of approximately 979,454, of whom 902,311 resided in the United States and Hawaii, 15,363 in Canada, 31,874 in Europe, 5,070 in Latin America, 1,731 in South Africa, 82 in Palestine and Syria, and 23,023 in the Pacific Islands, Australia and New Zealand. Proselyting was being actively carried on in all these areas, though not with so large a force as prior to the World War II.

The missionary work of the church was being done by self-sustaining men and women (before World War II, more than 2,000 of them) called to the service by the church, for periods of from two to two and one-half

years, except that mission presidents continued to serve from three to seven years. The church continued to pay the returning fare of each from his field of labour. The missionaries constituted a revolving group,—a few serving on more than one mission. A large proportion of the church male membership continued to fill missions at some period in their lives, usually while in their early twenties. All American missionaries were withdrawn from European countries at the beginning of World War II, but others were returning as rapidly as circumstances permitted. During the war, the young men who would normally have gone into the missionary work went into military service. There was a total Mormon military force of approximately 90,000 to 100,000 men who came from the church membership in the United States. The membership in foreign countries apparently furnished a proportionate quota.

Welfare.—In 1936, the Church Welfare program was set up to assist those in need of help, by furnishing them, according to the need of the individuals, food, or clothing, or shelter, or all three, with small amounts of cash. So far as possible those helped were expected to render some service therefor. From 17,000 to 50,000 had been given help each year since 1936. A principal feature of the program was the rehabilitation of discouraged individuals who had suffered reverses, making them again self-supporting, self-respecting, independent members of society.

Priesthood Activity.—Every male member of the church, 12 years of age and over, may hold some priesthood rank. There are two grades of priesthood, each divided into groups called Quorums: The Aaronic or Lesser priesthood (groups—deacon [lowest], teacher, priest, with 12; 24 and 48 members respectively in each group of Quorum), and the Melchizedek or Higher priesthood (elders, with 96 in a Quorum, high priests— indefinite number in groups—from whom the presiding officers of the church are drawn; seventies—with 70 in each group; and patriarchs, some 400 or more in the whole church). During the period 1937–46 these groups were intimately integrated in the welfare program, each group being urged to care for the needy members in its own group. The presiding authorities of the church were insistent that the principle of a common brotherhood of men be given practical application. During this period, the presiding bishopric of the church (at the head of the Aaronic priesthood) urgently sought to bring into line with church standards and practices, those who belonged to that priesthood, but had become slack in their observance of its obligations and duties. This group is usually spoken of as “the adult Aaronic priesthood group,” because normally a youth passes from the Lesser to the Higher priesthood when he is 18. The Melchizedek priesthood presiding officers also sought to bring their numbers into greater activity and more close observance of church standards, which include, besides the normal Christian virtues, tithesaying and the nonuse of alcohol in any form, of tobacco, tea, coffee and a temperate use of meat.

Education.—From its beginning the church had fostered education. Utah (predominantly Mormon) had for years stood near the top in states of the United States in standard literary gradings. The church during the period 1937–46, and just prior thereto, made over as a gift to the state of Utah, the junior church colleges it was operating. It then set up throughout the church and in some foreign countries, a considerable number of religious schools, in the neighbourhood of state high schools and colleges, where students might go for one to three hours

per day for religious instruction. Usually the secular schools not only did not oppose, but encouraged the establishment of these church institutions. By 1946, there were some 12 institutes (adjacent to colleges), and 98 seminaries, located near high schools. There were some 23,741 students taking religious training in these schools. In addition to these schools, the church continued to maintain the Brigham Young university at Provo (Utah), a school of recognized excellence in the college grade; a junior college at Rexburg (Idaho) and a high school at Juarez, Mexico. Extensive additions at Brigham Young university and Ricks college (Rexburg) were made, both in buildings and equipment. The church authorized considerable further additions of the same sort. These church schools had an aggregate attendance of about 5,000 students at the end of the decade.

Buildings.—During the decade 1937–46, the erection of new buildings was cut to the minimum. Nevertheless, there were 610 such structures built during that period, including one temple, at Idaho Falls, Idaho. Plans were made for an extensive postwar enlargement of the building program to include two new temples in the California area. Normally, the cost of these buildings (except temples) had been met by the people of the wards raising 50% and the church matching it; in the mission branches, the local participation was less. As it was aimed to keep the wards down to a membership of 500 to 750 members, there was a constant increase in the number of wards. During the period 1937–46, 214 new wards were created. In connection with each ward building, there was a “beautification program,” to landscape the grounds and keep the building itself painted and in good repair.

Morocco

See FRENCH COLONIAL EMPIRE; SPANISH COLONIAL EMPIRE.

Morrison, Herbert Stanley

Morrison (1888–), British statesman, was born at Brixton, London, on Jan. 3, 1888. Leaving elementary school at the age of 14, he passed through a variety of jobs as errand boy, shop assistant, telephone operator. In 1913 he entered politics and in 1915 (until 1940) was the secretary to the London Labour party. Originally a member of the Social Democratic federation, he later joined the Independent Labour party and then the Labour party. In 1922 he was elected to the London county council. After a term in parliament from 1923 to 1925, he regained his seat in 1929 and served as minister of transport and privy councillor in the second Labour government until 1931.

Dubbed the “organizer of victory,” Morrison created the electoral machine by which the Labour party in 1934 secured control of the London county council and of a majority of the metropolitan borough councils.

Returned to parliament again in 1935, Morrison became one of the three Labour members of the Churchill coalition government in May 1940. He served as minister of supply until October of that year, when he assumed the posts of home secretary and minister of home security. In 1941 he became a member of the war cabinet. With the breakup of the coalition government in May 1945 and the victory of the Labour party in the general election of July, Morrison emerged as leader of the house of commons and lord president of the council.

Mościcki, Ignacy

Mościcki (1867–1946), Polish scientist and statesman, was born in Russia, and was educated at the Polytechnic school of Riga, where he specialized in chemistry. He fled to England as a political refugee in 1892 to continue his studies. Five years later he was named assistant professor of electrochemistry and electrophysics at the University of Freiburg, Switzerland. Later he returned to Poland, where he accepted the chair of electrochemistry at the Polytechnic school of Lwow (1912). During this period, he instituted chemical research laboratories and developed factories for the manufacture of synthetic fertilizer. He made notable discoveries in connection with oxygenization of nitrogen in air. Noted for having perfected a method of manufacturing synthetic nitric acid, he owned over 600 patents on his many inventions.

Mościcki gave up his academic career to enter politics at the request of Marshal Pilsudski; when the Marshal declined the presidency, Dr. Mościcki was elected May 1926, while Pilsudski assumed the premiership. Mościcki continued to govern the country until Poland was invaded by Germany in Sept. 1939, when he was forced to flee to Rumania. Arriving at Cernauti he proclaimed a Polish government in exile, but 12 days later resigned in favour of Wladislaw Raczkiewicz, who established his government in Paris. An exile in Switzerland after 1939, Mościcki died at Versoix, Oct. 2, 1946.

Moscow

Between 1926, the year of the first complete census after the revolution, and 1939, the population of the Russian capital more than doubled, increasing from 2,029,425 to 4,137,018. But the relative expansion of living accommodation and transport facilities was wholly inadequate, with the result that the congestion of an already overcrowded city became almost insupportable. In the last years before World War II, plans were put into execution not only to accommodate this enlarged population, but also to change the character of the city from that of "an overgrown village," with which it had been content while Petrograd was the seat of government, to that of a fitting capital city of the largest country in the world. This program of development was cut short by the war, but not before it was sufficiently advanced to give an idea of the Moscow of the future. Several spurs of the famous subway, with its ornate, luxurious and often beautiful stations, were completed. The antique tramway system was supplemented by the first trolley-buses of modern design. Fast diesel trains began to serve the suburban lines. But in spite of these promising beginnings, the internal transport system was still overloaded to the point of breakdown in 1946.

The architectural results of this new drive were disappointing. The imaginative functionalism of the first decade of the soviet regime had been severely checked from above. Senior architects forgotten since the revolution found themselves reinstated and assisted at the rebirth of the

"traditional" Russian-Palladian style, as exemplified in the fussy and undistinguished façade of the new Hotel Moskva. The latest school of young architects found its ideal in the wedding-cake style of architecture and its apotheosis in K. S. Alabian's design for the gargantuan palace of soviets as amended by Boris Jorfán. This was planned to be the tallest building in the world (1,365 ft.) with its crowning statue of Lenin, 200 ft. high. This building, to be erected on the site of the 19th century cathedral of St. Saviour's, which was demolished to make room for it, was discontinued at the foundation stage when World War II broke out. The most successful completed building in the new style was K. S. Alabian's Red army theatre, completed in 1940, which ranked in 1946 as the finest theatre in the soviet union.

The architectural developments were paralleled in all the arts. The bold experimentalism of the Moscow artists of the 1920s had been resolutely curbed. The great theatre built for the producer Vsevolod Meyerhold was renamed the Tschaikovsky hall and was being used for concerts. The cry in all the arts was for a mixture of the realistic and the spectacular. Although the Moscow theatre remained the best in the world, it was no longer the most stimulating. It was probable that the period from 1930 onward would become known to historians as the Moscow period, in which cultural progress was checked while its front was broadened. In Sept. 1940 the aesthetic independence of Leningrad, until then jealously guarded, was broken by a purge. Moscow now set the tone for all Russia.

Economically, the most important development in Moscow was the completion in 1937 of the Moscow-Volga canal from the Khimki river, a few miles to the north of the city, to the new Moscow sea, an artificial lake running into the Volga. The completion of this canal in four and a half years turned Moscow into a major inland port with access to the White sea, the Baltic and the Caspian. The journey by water from Moscow to Leningrad was shortened by 685 mi. The canal was 79.5 mi. long, with a depth of 18 ft. and a width of 290 ft., rising and falling through 125 ft. through a series of 11 reinforced concrete locks, each 950 ft. long and 98 ft. wide. The artificial lakes made during its construction supplied Moscow with its drinking water.

The symbolism of the whole achievement was underlined by the magnificence of the architecture of the locks, the engineering works and the terminal ports.

In 1941 all development ceased. In Oct. of that year, after the fall of Mzhaisk, the city found itself just behind the front line and under constant short-range bombing from the air. Children and nonessential workers were evacuated, a midnight curfew was imposed and nobody could live in the city without a special pass. On Oct. 15, when the danger of German encirclement appeared acute, the diplomatic corps, all the Allied missions and the foreign press were evacuated to Kuibyshev (formerly Samara) on the middle Volga. It was this evacuation which gave rise to the false belief that Kuibyshev had become the seat of government. Many government departments were evacuated, but Stalin and the other soviet leaders remained in Moscow under heavy air bombardment and with the German army in Klin, Volokholamsk and Naro-Fominsk, a fact which had a stimulating effect on the morale of the people. Although Moscow was less hit by the bombing than London, the suffering of the people as a result of cold and undernourishment was, by western standards, intolerable, while the innumerable windows smashed by blast made thousands of apartments uninhabitable in the winter cold. Life during the winters of 1941 and 1942 was a

Lenin's tomb in Moscow, with Marshal Stalin and high soviet officials reviewing a show of strength on May day 1941, less than two months before Hitler launched his Russian offensive

bitter struggle for survival. There were no restaurants, and next to no fuel. Theatres that continued to function were unheated. But by the autumn of 1943 there was already a marked turn for the better, and many evacuees were allowed to return, among them most of the theatre companies. By 1945, recovery was almost complete. Rationing was relaxed. Fuel was available. Special shops were opened for the sale of unrationed goods. Already in 1946 the city had a prewar aspect. But the prior claims for the rebuilding of the devastated areas made it likely that renewed development of the capital would be delayed for some time.

Mosley, Sir Oswald Ernald

Sir Oswald Mosley (1896–), British politician, was born Nov. 16, 1896, and was educated at Winchester and Sandhurst. He served in parliament from 1918 to 1931 as, successively, Conservative, Independent and Socialist, and was chancellor of the duchy of Lancaster from 1929 to 1930. Leaving the Labour party in 1931, Mosley founded the "New party," and later became leader of the British Union of Fascists ("Blackshirts"). He and his party, sympathetic to the continental fascists and akin to them in philosophy and methods, were responsible for propaganda campaigns and riots directed against workers and Jews. In

May 1940, Mosley was arrested and interned in a British concentration camp and the British Union of Fascists was dissolved by government order.

Before the expiration of his sentence, Mosley was released, in Nov. 1943.

Motion Pictures

From the standpoint of product, motion pictures made notable progress in the decade 1937-46 in countries such as the United States and England where the screen remained free. In once-important areas where the screen came to be regarded as primarily an engine of propaganda, there was a falling off in artistic quality. Popular patronage of motion pictures greatly increased and continued high.

National interchange of pictures became difficult. The United States retained its lead in world markets generally, with England in a challenging position.

Basically, the technique of the motion-picture art was not drastically altered. In the United States, there was a strong trend toward increasing luxuriousness of production, with a similar tendency in England. In the realm of art forms, the major share of experimentation was done by Walt Disney. His innovations were variations of the animated colour picture and had little effect on general production.

The most successful of the Disney pioneering efforts was *Snow White and the Seven Dwarfs* (released in 1938), the first animated feature-length picture. (Animated drawings had previously been restricted to the field of short subjects.) *Snow White* became one of the sensational box-office productions of the motion-picture industry. It was

Robert Donat as the English schoolmaster in *Good-bye, Mr. Chips*, the role which won him the 1939 Academy award as best actor of the year

Above: Hedy Lamarr and Charles Boyer in *Algiers*. The Viennese actress made her American debut in this picture, in 1938

Circle: Luise Rainer (centre), voted the 1937 Academy winner for her performance in *The Good Earth*

Below: Clark Gable and Vivien Leigh in *Gone with the Wind*, voted the best picture of 1939 by the Academy of Motion Picture Arts and Sciences

Paul Muni in the title role of *The Life of Emile Zola*, which was awarded the 1937 Academy award as best production of that year

followed by other animated features, including two non-Disney productions, but none duplicated the success of the original.

Fantasia (1940) is describable as an illustrated concert. Music by Ludwig van Beethoven, Johann Sebastian Bach, Franz Schubert and other composers was played by the Philadelphia Symphony orchestra with Leopold Stokowski conducting, and interpreted by Disney animation.

Disney used a combination of actors and animation in *The Three Caballeros* (1944), and name players began to appear in his pictures. Metro-Goldwyn-Mayer also successfully combined live action and animation in part of *Anchors Aweigh*.

A picture memorable from the standpoint of type originality was *The Mikado*, a screen version of the Gilbert and Sullivan comic opera, which was produced in England by Herbert Wilcox. *Wilson* (produced by Darryl F. Zanuck for 20th Century-Fox) should also be considered as a landmark in film history. This story of the career of Pres. Woodrow Wilson, with emphasis on his fight for the League of Nations, excited considerable political controversy, coming as it did in the presidential election year of 1944. An expensively produced picture, *Wilson* was not financially successful but contributed greatly to the reputation of the U.S. screen.

Gone with the Wind (produced by David O. Selznick and released by Metro-Goldwyn-Mayer), based on Margaret Mitchell's best-selling novel of the U.S. Civil War, became the greatest box-office picture in history. By mid-1943, estimates of its domestic gross ran as high as \$32,000,000. Its cost of production was placed at around \$4,000,000.

Type Trends; Music.—There were a number of distinct type trends during the 1937-46 period. Naturally, World War II inspired many dramas. *Mrs. Miniver* was one of the outstanding pictures of 1942; and its feminine star, Greer Garson, won the actress award of the Academy of Motion Picture Arts and Sciences, the U.S. criterion of industry recognition of achievement. Another great war picture was *Thirty Seconds over Tokyo*.

One of the most daring pictures made was *The Grapes of Wrath* (1940), based on John Steinbeck's novel dealing with the California migration of refugees from the U.S. middle west during the period of drought and depression. The picture was extremely controversial, as was *How Green Was My Valley*, showing labour conditions among the Welsh miners. Both of these pictures were produced by 20th Century-Fox.

In 1944 *Going My Way* (Paramount) won the Academy award. Its success, and that of Bing Crosby, winner of the Academy male acting award, caused a trend in the direction of religious pictures. *The Bells of St. Mary's* (RKO), also very successful, followed. Both productions were directed by Leo McCarey.

Psychological dramas became popular in 1944. Outstanding were *Laura* (20th Century-Fox) and *Double Indemnity* (Paramount).

There was a strong movement toward better music. Columbia's *A Song to Remember*, based on the life of Frederic Chopin, was reviewed by music critics as well as motion-picture writers. The dubbing was so perfect that it was not discernible that the piano was played by José Iturbi, and not by Cornel Wilde, the star. This picture brought Wilde into popular notice. The English picture *The Seventh Veil* had music by the London Symphony orchestra. For Republic's *I've Always Loved You*, Artur Rubinstein did the recording.

The quality of music advanced in the popular field as

well as in the classical. During the latter part of the decade there was a definite trend toward the popular composers. Portrayal of the life of Jerome Kern in *Till the Clouds Roll By* (Metro-Goldwyn-Mayer) gave an opportunity to use the beautiful Kern music. Warner Brothers' *Night and Day*, depicting the career of Cole Porter, was noteworthy for its perfect dubbing, with Cary Grant, in the role of Porter, doing only the fingering and not the actual playing of the music. Also noteworthy was the same studio's *Rhapsody in Blue*, the story of George Gershwin. Many of his great tunes, including "Rhapsody in Blue" and music from *Porgy and Bess*, were effectively used.

Alexander's Ragtime Band (20th Century-Fox, 1938), featuring the work of Irving Berlin, was one of the first successful musicals. *Blue Skies* (Paramount, 1946), with Bing Crosby, while not a great picture, was musically worth presenting for its Berlin melodies. Busby Berkeley, the first director of this type of picture, relied largely on camera tricks to get his effects. While the later productions were much more elaborate and expensive, there was more feeling of intimacy in the sets than with the faraway technique employed in the earlier days of screen musical comedies. It is safe to say that no great musical on Broadway was comparable in the matters of sets and costumes with the later Hollywood offerings.

Artists.—A survey of U.S. and British production during the decade revealed among the leading artists of the screen such names as Ingrid Bergman, Bette Davis, Greer Garson, Vivien Leigh, Jennifer Jones, Joan Fontaine, Claudette Colbert, Gregory Peck, Robert Donat, Laurence Olivier, Gary Cooper, Ronald Colman, James Mason, Lionel Barrymore, Claude Rains and Humphrey Bogart.

Academy awards for the best performances by actors and actresses follow: 1937, Spencer Tracy, Luise Rainer; 1938, Spencer Tracy, Bette Davis; 1939, Robert Donat, Vivien Leigh; 1940, James Stewart, Ginger Rogers; 1941, Gary Cooper, Joan Fontaine; 1942, James Cagney, Greer Garson; 1943, Paul Lukas, Jennifer Jones; 1944, Bing Crosby, Ingrid Bergman; 1945, Ray Milland, Joan Crawford; 1946, Frederic March, Olivia de Havilland.

Academy awards for the best picture of the year were: 1937, *The Life of Emile Zola*; 1938, *You Can't Take It With You*; 1939, *Gone with the Wind*; 1940, *Rebecca*; 1941, *How Green Was My Valley*; 1942, *Mrs. Miniver*; 1943, *Casablanca*; 1944, *Going My Way*; 1945, *The Lost Weekend*; 1946, *The Best Years of Our Lives*.

The annual U.S. critics' poll of the *Film Daily* (New York) gave the following winning pictures: 1937, *The Life of Emile Zola*; 1938, *Snow White and the Seven Dwarfs*; 1939, *Goodbye, Mr. Chips*; 1940, *Rebecca*; 1941, *Gone with the Wind*; 1942, *Mrs. Miniver*; 1943, *Random Harvest*; 1944, *Going My Way*; 1945, *Wilson*; 1946, *The Lost Weekend*.

Box-office favourites of the U.S. public included Betty Grable, Lana Turner, Shirley Temple, Mickey Rooney, Judy Garland, Frank Sinatra, Van Johnson, Alan Ladd, Lauren Bacall. Margaret O'Brien made her appearance as the greatest child star since Shirley Temple, who had won the U.S. exhibitor poll of the *Motion Picture Herald* (New York) four times in succession. Miss Temple made her debut as an adult actress in 1944. Two comedians, Bud Abbott and Lou Costello, sprang into sensational popularity, and Bob Hope's name became a household word. Paramount's "Road" pictures (*Road to Morocco*, *Road to Utopia*, etc.) with Hope and Bing Crosby were outstanding successes. Danny Kaye achieved wide popularity.

Leaders in the *Motion Picture Herald's* polls of exhibitors for box-office popularity were: 1937, 1938, Shirley Temple; 1939, 1940, 1941, Mickey Rooney; 1942, Bud Abbott and Lou Costello; 1943, Betty Grable; 1944, 1945, 1946, Bing Crosby.

For artistic accomplishment as directors, the following names were outstanding: Frank Capra, Alfred Hitchcock, Preston Sturges, John Ford, Mervyn LeRoy, Robert Siodmak, Edmund Goulding, Leo McCarey, Henry King, Clarence Brown, Billy Wilder, William Wyler. The directorial awards of the Academy were: 1937, Leo McCarey; 1938, Frank Capra; 1939, Victor Fleming; 1940, 1941, John Ford; 1942, William Wyler; 1943, Michael Curtiz; 1944, Leo McCarey; 1945, Billy Wilder; 1946, William Wyler.

Documentary Films.—World War II and the "war of nerves" preceding it caused a dramatic rise in the importance of the documentary, or factual, film. Such pictures had been made before, but under troubled world conditions their scope greatly expanded. Documentaries in some instances attracted greater popular attention than that accorded films produced for entertainment purposes alone. *Sieg im Westen* (*Victory in the West*) was well designed to impress neutrals with the strength of the German armies that overran the Low Countries and France. In the United States, the Academy of Motion Picture Arts and Sciences added documentary recognition to its awards. Among such pictures thus recognized were *The Fighting Lady* (20th Century-Fox and U.S. navy) and *With the Marines at Tarawa* (U.S. marine corps). Documentaries were made both as feature-length pictures and as short subjects. Some were photographed in 16-mm. colour, then blown up to 35-mm. for theatrical exhibition. In many instances, photographic recording of the fighting by land, sea and air exposed the makers of documentaries to the same perils as the armed forces, and a number lost their lives.

Newsreels increased greatly in importance, especially in the stirring days preceding the conflict, when censorship had not yet assumed the rigidity of wartime. Theatres devoted entirely to newsreel pictures were heavily patronized.

Training and visual educational films also made noteworthy advances. Previously, educational pictures had occupied their most important positions in Germany, France and Russia. After World War II, they were given added consideration in the United States.

The possibilities of the 16-mm. film in the entertainment field also drew the attention of the U.S. industry in the postwar period. Major studios made plans to export such pictures to foreign regions where exhibition of 35-mm. films was regarded as impracticable.

Colour.—The outstanding physical development of motion pictures was the greatly increased use of colour photography, corresponding, though in a far less degree, to the change-over from silent pictures to sound in the previous decade. Unlike the sudden and complete conversion to sound, the trend to colour was gradual and fluctuating.

The first U.S. feature picture in colour, *The Gulf Between*, had been produced in Technicolor at Jacksonville, Fla., in 1917. It had been preceded in England by the Kinemacolor process. Early colour pictures were characterized by glaring hues and wide colour fringes. Hollywood experienced a colour boom in 1929-30; but the colour was not good enough or cheap enough, and the vogue ebbed. In 1932 Technicolor brought out its three-strip or three-component process, which gave a high degree of perfection. This process, requiring special cameras, was later

supplemented by the Monopack process, which permitted the use of a single original in any standard type of studio motion-picture camera. War conditions delayed a wider use of Monopack, but by 1946 about a half-dozen features had been photographed entirely by this process.

War conditions undoubtedly had a great deal to do with this development. Psychologically, colour increased the effectiveness of entertainment in regions where the world, outside the theatre was overshadowed by the tragedy of war, and lights were blacked out or dimmed. In the United States, colour was called upon to give additional production value to pictures hampered by shortages of star names and wartime set and location restrictions. Increased box-office returns allowed wider latitude for the use of a medium naturally more expensive than black-and-white photography. Colour was used to quicken the build-up of star material. Certain actresses found to be unusually attractive in colour were cast as often as possible in that medium. Such players included Maureen O'Hara, Jeanne Crain, Maria Montez and Yvonne De Carlo. Some producers came to regard colour as their greatest maker of stars.

Increased use of colour caused a minor revolution in the preparation of pictures for production. Sets and costumes had to be considered from the standpoint of colour effect, and directors came to draw upon colour qualities for characterization and the pointing up of dramatic and emotional values.

Ironically, when the break to colour came, it was impossible to satisfy the demand. In 1945 Technicolor, the dominant process, was used on 26 features in the United States, less than 10% of the total number of features produced. Postwar economic conditions delayed immediate expansion of the existing Technicolor plants. In the United States, Cinecolor and Trucolor (described as a development of Magnacolor) were increasingly used for photographing features, although not on the budget scale of Technicolor productions. In 1937 the Technicolor output of 35-mm. prints in the United States was 40,561,318 ft.; the 1945 footage was 160,471,837. The 1945 output of the English Technicolor plant was 42,482,000 ft.

In the United States, colour was first used mostly on outdoor action pictures. Then it came to be in strong demand for costume pictures and spectacles. By the close of 1946 expensive musicals in colour were the rule and those in black-and-white the exception. When colour was used on a psychological picture such as *Leave Her to Heaven*, there were critics who asserted that black-and-white would have been a more effective medium. Yet box-office estimates placed the picture as 20th Century-Fox's top-grossing production.

With colour in world demand, the German Agfa process attracted much attention in other countries. Investigators descended upon occupied Germany from England, Russia and the United States. The U.S. mission was headed by Nathan D. Golden, chief of the motion-picture division of the U.S. department of commerce. Favourable reports were brought back, and it was hoped to make the German techniques available to U.S. producers. The east-west political cleavage following the war had its repercussions even in the field of colour. In 1946 a Russian documentary in colour, *Russia on Parade*, was exhibited in the United States. The process was called "Natural Sovcolor." According to the *Motion Picture Herald*, this process was described by the picture's sponsors as "a secret known only to Soviet film producers, and represents years of experimentation." "What is omitted," the publication commented, "is that Russian soldiery occupied the Agfa plant

at Wolfen, Germany, in mid-1945, seized the technicians and the Agfa color process, and refused to allow an American commission to visit Wolfen."

Production Costs.—The trend in U.S. production was toward fewer and more expensive pictures. U.S. feature pictures approved by the Production Code administration of the Motion Picture Association of America in 1945 numbered 358, the lowest figure since the early days of the industry (in 1937 the number was 587). Hollywood production costs for 1945 were estimated at \$401,577,800 (*Film Daily*); the estimate for 1937 was \$152,500,000. War conditions contributed heavily to the trend. Stemming from the "bargain offerings" of the depression period, the double feature program had developed strongly. This resulted in the Hollywood studios' gearing their production to "A" pictures, to head dual bills, and "B" pictures, to supplement them. During the war and its aftermath, increasing production difficulties and sharply rising costs militated against the making of "B" pictures.

One of the great problems of motion-picture production, especially in countries where the output was large, was finding suitable subject matter for pictures. Reports of the Production Code administration showed that, for the U.S. industry, the basic sources of screen material altered their status very little during the decade. In 1945 original stories amounted to 64.5% of the total; in 1937, 64.3%; novels, 1945, 15.2%; 1937, 16.8%; stage plays, 1945, 6.7%; 1937, 6.4%.

In the early days of the industry, a million-dollar production evoked all the superlatives in the dictionary of exploitation. In 1946, in the major studios of the United States, budgets in the millions were no longer subjects for a comment. The fabulous salaries paid to the top people of the industry, coupled with the skyrocketing of labour and material costs, would have meant heavy budgets in any event. Also, pictures generally were planned on more ambitious scales; and prices paid for literary properties, such as novels and plays, rose to record heights. And to all these contributory elements was added the increased artistry of production. Once directors had prided themselves on the number of scenes they could shoot in a day. In 1946 stepped-up artistic rivalry caused more painstaking, and therefore slower, filming. The result was finer and more expensive pictures.

The success of *Gone with the Wind*, which ran for more than three hours, materially affected the trend toward increasing length of high-budgeted pictures. Exhibitors began to complain that pictures were too long, and many reviewers corroborated their testimony. "If the picture had been shorter, it would have been better," became a common critical tag.

Outstandingly illustrative of the heavy-budget trend was *Duel in the Sun*. It was estimated that, including exploitation, it had cost David O. Selznick \$9,000,000 up to October 1946. Darryl F. Zanuck spent \$4,000,000 on *The Razor's Edge*, considered one of the finest pictures, with the possible exception of *Wilson*, ever made by 20th Century-Fox.

U.S. audiences became accustomed to the more expensive brand of picture, and "war money" allowed them to gratify their tastes. According to the *Film Daily*, the average price of admission rose from 23 cents in 1937 to 30.5 cents (exclusive of an average 6.4-cents tax) in 1945. Estimates on weekly attendance at U.S. film theatres in 1945 ran as high as 98,000,000 (*Motion Picture Almanac*); 1937 estimate, 85,000,000. Estimates on total receipts of U.S.

theatres (excluding admission taxes) ran from \$1,300,000,000 (*Motion Picture Almanac*) to \$1,500,000,000 (*Film Daily*) in 1945 (1937 estimate, \$1,052,480,000, *Film Daily*).

In 1946 *Variety* (New York) estimated that, over the entire history of the U.S. motion-picture industry, 33 Hollywood productions had grossed, or gave promise of grossing, a minimum of \$4,000,000 in domestic rentals. Of these, 16, or nearly half, belonged to the lush 1945-46 period.

The immediate postwar period found the U.S. studios generally in the best financial condition in their history. The box-office boom took care of both increased production costs and heavy taxes. But industry leaders warned of the possibility of attendance decline, with resulting enforced retrenchment. Studios producing animated pictures already felt the pinch of rising costs.

Capital investment in the U.S. film industry was placed at \$2,050,000,000 (U.S. department of commerce, *Motion Picture Herald*), including theatres \$1,900,000,000; studios \$125,000,000; distribution \$25,000,000. It was estimated that about 200,000 persons were employed on an average in all branches of the industry, with payroll estimates running as high as nearly \$500,000,000 yearly (*Film Daily*).

In the immediate postwar period, in both the production and theatrical fields, there was need for physical improvement and new construction, which largely had to wait on economic conditions.

Hollywood had attained its status as the world motion-picture capital by drawing heavily upon foreign talent. For years, outstanding achievement by actors, directors, etc., had been equivalent to a passport to Hollywood. The U.S. film industry offered foreign artists larger rewards and greater opportunities than were available to them at home. This condition tended to drain other countries of their best talent and contributed in no small degree to U.S. supremacy in world markets. The coming of sound naturally tended to restrict the influx of players from non-English-speaking lands, and the rise of nationalistic ideologies further militated against the free movement of talent. After World War II the free movement of talent between the United States and the various parts of the British empire was resumed, and a number of British stars and directors apportioned their time between England and the United States.

War Contributions.—While the various countries involved in World War II made what use they could of their motion-picture industries, naturally the outstanding contribution was made by that of the United States, because of its exceptional facilities. The U.S. industry's over-all organization for war was the War Activities committee. Through its Theatres division, more than 16,000 film houses pledged themselves to exhibit government information films, and the theatres also participated prominently in the sale of war bonds, raising funds for patriotic purposes, etc. The War Activities committee donated to the army for overseas distribution 43,306, 16-mm. prints of feature pictures and 33,326 prints of short subjects. Audiences viewing these pictures were estimated at 750,000,000.

Three days after the Japanese attack on Pearl Harbor, the Hollywood Victory committee was organized. Its task was to co-ordinate the morale activities of the industry. Under its auspices, players of both sexes, including outstanding stars, entertained servicemen both at home and overseas. They also went on tours to sell war bonds, made radio broadcasts for the war effort and appeared in films produced for war purposes. The Hollywood canteen, operated by industry celebrities, entertained more than 3,000,000 servicemen and -women.

Many of the stars visited the remote war fronts where the fighting was heaviest. Bob Hope, Bing Crosby, Joe E. Brown, Frances Langford, Kay Francis, Carole Landis, Martha Raye, Betty Hutton and Paulette Goddard were among the scores who distinguished themselves. Carole Lombard lost her life early in the war in a plane crash on war bond service.

Some idea of the scope of the Hollywood Victory's committee's war service may be gained from the following statistics: 56,037 free appearances by 4,147 personalities; 122 overseas tours; 406 hospital and camp tours; 214 personalities on war-bond broadcasts and radio transcriptions; 2,438 entertainment transcriptions for overseas transmission by Armed Forces Radio service; 38 films made with top stars; 390 broadcasts and transcriptions and 461 personal appearances for war relief and charity.

The U.S. industry turned out about 4,000 war-training films for the government, at cost. As needed, physical facilities of studios were placed at the disposal of the government without charge. Other productions included documentary films, government trailers and inter-American relations films. Stars made personal appearances in Latin-American countries in furtherance of their government's good-neighbour policy.

Many actors, directors, executives, writers and others, entered the armed forces. The War Activities committee estimated that about 7,000 men—one-third of those commonly employed in the motion-picture industry in Hollywood—were in the services. The knowledge of film technicians was found to be invaluable in modern warfare. Among the industry's outstanding technical contributions were such specialists as cameramen, camouflage experts, sound department technicians skilled in radio work and aircraft detection, laboratory technicians, precision machinists and electrical experts.

Aside from the depletion of manpower, the U.S. industry felt the war in many ways. Raw film stock was rationed by the government; set construction was limited; there were shortages of vital supplies and materials and location shooting was curtailed because of safety restrictions, rationing of gasoline and tires, etc. The situation of the British industry was worse, with studio space requisitioned by the government for war purposes. Yet technical ingenuity made a splendid showing in grappling with war hindrances.

Censorship and Politics.—Time had been, at least in the democratic countries, when studios could consider their production program from the standpoint of potential entertainment value alone. In English-speaking countries generally, censorship concerned itself with questions of morals and good taste. As the world moved toward war, other matters had to be pondered, especially from the standpoint of dwindling foreign markets. Under totalitarian regimes, the line already had been drawn against importation of pictures reflecting upon national ideologies or presenting attractively other ways of life. *

Nationalistic feelings rose in intensity. Nations, especially minor powers, became fearful of permitting the exhibition of pictures which might give diplomatic offense to mighty neighbours. Even when censorship was not official, riots could be stirred up by one group of sympathizers or another. When Charles Chaplin's *The Great Dictator*, burlesquing Adolf Hitler and Benito Mussolini, was released after the outbreak of the war in Europe, its exhibition became a matter of contention in a number of South American countries. It was charged that axis diplomats in Latin America used their official influence to ban pictures which they regarded as inimical.

The U.S. motion-picture industry early took a stand against nazism and its affiliated philosophies. This position aroused the antagonism of the so-called noninterventionist elements. In the heat of the bitter political debate that preceded the U.S. entry into the war, the latter forces charged that the industry was seeking to involve the nation in the conflict. Though the industry's attitude very much resembled that of Pres. Franklin D. Roosevelt's, a number of its leading executives were summoned before a senate subcommittee in 1941 for questioning on the subject of war mongering. Maintaining their abhorrence of Hitlerism, they denied the existence of any conspiracy to produce propaganda for war and asserted as a public service the right to make pictures concerning current events.

In one form or another, political pressure with the avowed or masked purpose of oppressive censorship, remained to plague the industry. Permanent government censorship, dreaded above all else, was advocated in some form or another. During the war, government censorship was limited to licensing of films for export.

In the postwar period, the U.S. industry underwent attack on charges, emanating prominently from the house of representatives Committee on Un-American Activities, that some of its leading figures were communists or "fellow-travelers." The result of continued agitation was to make many motion-picture celebrities increasingly political minded. Stars, producers, directors, etc., were in the forefront of the presidential campaign of 1944 on both the Democratic and Republican sides, and this political interest continued.

After the war, the industry breathed more freely insofar as the threat of official censorship was concerned. Then in 1946 it found itself involved in a censorship controversy of an internal nature. The Production Code administration, the self-regulatory organization of the industry, withdrew its official seal from Howard Hughes's *The Outlaw*, on the ground that advertisements of the picture had not been submitted for approval. Hughes sought redress in the courts. *The Outlaw* scored sensationally at the box office, though it ran into local censorship troubles in a number of communities.

The Independents.—Motion-picture production in the United States tended to decentralize. Independent producing companies, making their own products and releasing through the distribution set-ups of larger studios, became more numerous, especially in 1944 and thereafter. In the ranks of the independents were found stars, directors, writers, executives and others. Among the reasons given for this development were soaring box-office returns, ease of obtaining capital, tax advantages and greater freedom of action. Among those who entered the ranks of the independents were Frank Capra, William Wyler, Hedy Lamarr, Hunt Stromberg, Rosalind Russell, Dudley Nichols, Joan Fontaine, William Dozier, Hal Wallis, Joan Bennett, Walter Wanger, Fritz Lang, Gary Cooper, Ginger Rogers, Charles Einfeld and Bing Crosby. In 1946, International, headed by William Goetz and Leo Spitz, merged with Universal, the resulting organization being known as Universal-International.

World Market.—In his report as president of the Motion Picture Association of America (dated March 25, 1946), Eric Johnston said: "A world market for American motion pictures spells the difference between profit and loss for the American industry. I am told that at least one third of the negative cost of motion pictures produced in this country must be recovered from foreign revenue. Sub-

stantial reduction in this revenue will either restrict expenditures for production to the artistic detriment of the product or throw heavier burdens on American exhibitors and consumers."

According to the Motion Picture Association of America, the loss of axis-dominated territories in war years "was largely offset by the extraordinary demand for motion picture entertainment in territory which still remained open. For example, attendance at British motion picture theatres in 1944 was practically double pre-war average." It was estimated that U.S. sales abroad in 1946 would realize about \$120,000,000.

For years before the war, while a nominal tariff was the only requirement for entry of foreign films into the United States, other countries generally had increased their restrictions. Reasons ranged anywhere from the national honour to the national economy—ideological considerations, desire for increased revenues, fostering of domestic production. To cope with the British quota law (*see below*), U.S. companies produced pictures in England. Naturally, the U.S. industry was most affected by such restrictions. It was estimated by *Film Daily* that in 1937 the percentage of screen time in all foreign markets for U.S. pictures was 70%.

Among postwar obstacles in various countries were listed (Motion Picture Association of America) excessive import duties, internal tax measures assessed against foreign films after importation, quota laws requiring a certain percentage of theatre playing time for native pictures, discriminatory theatre taxes upon exhibition of foreign films, government monopolies, theatre combines having the effect of monopolies and government censorship. In the last category it was stated that "in countries within the sphere of Soviet influence motion pictures which present other forms of government in a favorable light are rejected." Also, there were still occasional rejections based on supposed derogatory references to a country. And, hard as it was to get U.S. pictures into many countries, it was still harder to get the dollars for them out. In 1945 the Motion Picture Export association was organized to deal with foreign problems of the U.S. industry.

One of the factors in national restrictions on foreign motion pictures was the increasing realization that trade follows the film, especially with reference to the U.S. product. It was felt that, in the guise of entertainment, U.S. motion pictures indirectly advertised U.S. goods and services abroad. This situation had various ramifications. After the war, it was believed in some U.S. and British quarters that the showing of certain types of pictures in regions which had suffered most from the conflict would have an adverse effect on audiences. It was reasoned that people sunk in economic misery would view with resentment films showing, by their standards, characters luxuriously fed and clothed. To such audiences, according to this view, musical comedies, which made no pretense of reality, and other escapist fare would be most acceptable.

One of the foreign problems of the U.S. industry was the accumulation of 5 years' product which had not been permitted to be shown in 30 axis-controlled countries during the war. It was felt that any general "dumping" of these pictures would have a disastrous effect, even if permitted. There was no question of the desire of the populace in such countries to view U.S. films. It was reported that in a number of regions not yet reopened to importation, prewar U.S. pictures were extremely popular.

Though having an overwhelming lead in the produc-

tion of top features, the United States, in peace times, did not make nearly so many pictures as the rest of the world. In the 1930s Japan was producing from 450 to 550 pictures annually. Europe produced 721 features in 1936. About 1,300 features were made outside the United States in 1939, in which year the Production Code administration listed 527 U.S.-produced features.

Administration and Labour.—In 1945 the U.S. motion picture industry came under new leadership in both the Motion Picture Producers and Distributors of America (which later became the Motion Picture Association of America) and the Society of Independent Motion Picture Producers. Eric Johnston, president of the U.S. chamber of commerce, became president of the first-named organization, and Donald M. Nelson, who had served as chairman of the War Production board, of the latter. Johnston succeeded Will H. Hays, whose incumbency since the formation of the organization in 1922 had given it the popular designation of the Hays office. Byron Price, who had been in charge of government censorship during the war, became vice-president in charge of Hollywood activities of the Motion Picture association.

Labour conditions in the U.S. industry were matters of concern at various times during the 1937-46 decade. The beginning of the period saw the industry thoroughly organized, from stars to set workers. The most serious labour difficulties had their roots in jurisdictional disputes rather than in straight employer-employee disagreements. The workers in the industry, with the exception of such groups as extra players, were regarded as among the best paid in the United States. In 1941 George M. Browne, president of the International Alliance of Theatrical Stage Employees (I.A.T.S.E.), and William Bioff, its Pacific coast representative, were convicted in federal court in New York on charges of extorting \$550,000 from 4 major studios under threats of strikes. Browne's sentence was 8 years, Bioff's 10 years, each being fined \$20,000. Both were later paroled.

The industry's gravest labour troubles grew out of conflict between the I.A.T.S.E. and the Conference of Studio Unions. In March 1945 the C.S.U. struck, after a controversy over the affiliation of a small number of set decorators, the I.A.T.S.E. endeavouring to keep the studios operating. The strike lasted for eight months with the C.S.U. finally winning its point in the settlement. However, the labour situation remained uneasy, and the fall of 1946 found the C.S.U. again picketing the studios. In neither strike was production stopped, but it was made more difficult and expensive. The decrease in the number of pictures turned out in 1945 was attributed in part to strike conditions. Both the I.A.T.S.E. and the C.S.U. (with the exception of one union) were affiliated with the American Federation of Labor.

Antitrust Suit.—In the United States, there had for years been exhibitor complaints against the practice of "block booking" and "blind selling" by which the entire yearly output of studios was contracted for by theatres in advance. The result of government antimonopoly action was the so-called "consent decree" in 1940. Most of the larger companies agreed to sell their pictures in maximum blocks of five, after regional showings to exhibitors. After the expiration of the consent decree, the government antitrust action against eight companies went to trial in U.S. district court in New York in 1945. The government contended that theatre control (charged against five companies) and various asserted trade practices were monopolistic in nature. The announcement of the court findings, given in 1946, did not call for general divorcement of thea-

tres but prescribed new trade practices in the method of distributing pictures. Both sides were dissatisfied with various provisions, and final determination was still awaited.
(L. O. P.)

The British Cinema

Britain's 4,750 cinemas, mostly showing double-feature programs, required about 500-600 feature films a year to keep their entertainment constantly changing. Ever since World War I, exhibition demands had greatly exceeded the supply of British-made films, so that during the 1920s programs were almost entirely made up of U.S. films. In 1927 a quota act was introduced making it legally obligatory for British exhibitors to show a growing percentage of British-made films. This resulted in only a few British features of good quality; most of the product was cheaply made second-grade features to fulfil the quota. In 1938, however, the act was renewed; the quota which had begun originally at 5% was fixed at 12½% for 1938, rising to 20% in 1942 and 25% in 1947. This quota was revised during World War II and kept stable at 15%. Later it was raised to 17½% for 1946 and 22½% for 1947. The new quota act also aimed at eliminating the cheap and shoddy film by laying down a cost clause of £21,000 minimum to be spent on British labour in the course of production of a film qualifying for quota. Nevertheless, the three years prior to the war were years of slump in British film production; among the few notable feature films made were Leslie Howard's *Pygmalion*, Michael Powell's *The Edge of the World*, Carol Reed's *Bank Holiday* and *The Stars Look Down*, Victor Saville's *Goodbye Mr. Chips* and King Vidor's *The Citadel*. The two last-named films were sponsored by U.S. companies working in Britain.

George Bernard Shaw (right) and Director Gabriel Pascal on the set of Shaw's *Caesar and Cleopatra* where Vivien Leigh is shown rehearsing a scene at the foot of the sphinx. Filmed in England in Technicolor, the picture was released in the U.S. in 1946

With the cinema as the largest single entertainment medium in Britain for mass audiences, it was obvious that the British film should play its part during the war years and not be almost entirely eliminated from the screen as it had been during World War I. The few notable films made in previous years had shown that fine cinema could be produced in Britain provided that men and women devoted to the medium were concerned in the production. Nevertheless, when the board of trade announced that the quota in favour of the British product was to be maintained, producers were faced with unenviable problems to solve. Barely one-third of the technicians were left. Studios were requisitioned by the government either for official production (service training films, etc.) or for storage depots. In 1939 there were 65 sound stages in production; in 1942 there were only 30. Film stock went into short supply. Raw materials for sets and costumes became matters over which to haggle with government departments. The craftsmen required to keep sets built in a studio were the very men most needed outside in bombed and devastated cities.

But there was another side to the picture. The difficulties, and the times which caused them, were a challenge to the producers, artists and technicians left on the set. A new serious purpose came into the industry to meet the demand of the audiences of the period for authenticity and sincerity. Film after film was made which aimed at re-creating the atmosphere of those intense years not merely as the serviceman and servicewoman saw them, but as the civilian experienced them at home. These films constituted a revolution in British feature-film production. For the first time British people met themselves on the screen and met themselves in films as imaginative and sympathetic to the national character as the best French films had been during the 1930s. The increasing British audiences recognized this new quality, and the British product became good box office.

Among the war films should be remembered Noel Cow-

ard's and David Lean's naval film, *In Which We Serve* (1942); Frank Launder's and Sidney Gilliat's study of women in industry, *Millions Like Us* (1943); Thorold Dickinson's army security film, *Next of Kin* (1942); Leslie Howard's film about R. J. Mitchell, designer of the "Spitfire," *First of the Few* (1942) and his film about service-women, *The Gentle Sex* (1943); Charles Frend's picture of merchant seamen, *San Demetrio, London* (1943); Anthony Asquith's film of submarine warfare, *We Dive at Dawn* (1943), and Harry Watt's film of a tank unit isolated in the desert, *Nine Men* (1943). Later war films, concentrating increasingly on personal problems rather than war action, were *Waterloo Road* (Gilliat and Launder, 1945), *The Way Ahead* (Carol Reed, 1944), *The Way to the Stars* (Anthony Asquith, 1945) and *Journey Together* (John Boulting, 1945). The last named was remarkable since it was a feature film sponsored and made by the royal air force. Other officially sponsored films of feature length, but close to the documentary style in the treatment of their narratives, included *Target for Tonight* (R.A.F.), *Close Quarters* (the submarine service) and *Western Approaches* (the Crown Film unit's feature film in Technicolor on the merchant service).

Not all the more distinguished wartime product was about the war itself. The melodrama *Gaslight* (1940) and *The Prime Minister* (1941), a film about Benjamin Disraeli, were made by Thorold Dickinson. *Kipps* (Carol Reed, 1941) was an excellent comedy from H. G. Wells's novel. John Baxter's *Love on the Dole* was a fine working-class film. Noel Coward and David Lean made *This Happy Breed* in 1944 about a London suburban family. These and some other films consolidated or added to the reputations of such directors as Thorold Dickinson, Leslie Howard, Anthony Asquith, Michael Powell, Charles Frend, Frank Launder, Sidney Gilliat, John Baxter, Carol Reed, Roy and John Boulting and David Lean.

Meanwhile the financial background of the British film industry was undergoing considerable modification. Britain had about 4,750 cinemas of which approximately 2,000 were first-grade theatres. Of these 2,000, more than 1,100 were owned by three combines, Odeon, Gaumont-British and Associated British Cinemas. The last was financially linked with Warner Brothers of the U.S.A. By 1941 the two former came under the control of the Rank organization, which also had acquired about 50% of the studio space of the country. This placed Arthur Rank as the undisputed financial controller of the major part of the British film industry, rivalled only by Associated British Cinemas in exhibition. London, the shop window for the film industry, became the centre of distribution for all films; and two-thirds of the first-grade cinemas in the London release area were controlled by the three circuits. To secure even reasonable financial returns, all films had to be booked and shown by one or another of the three circuits. There was, therefore, virtually no feature-film production in Britain without previous distribution agreements with one of the circuits. British first-feature films cost normally between £125,000 and £312,500 to produce; with circuit booking they could earn more than £375,000 on the home market alone. Without circuit booking their earnings would be small and indeterminate. Rank had concluded deals with U.S. distribution companies for the exhibition of his product overseas, and was to acquire chains of cinemas abroad, particularly in the British commonwealth.

By virtue of owning more than half the studio space of the country, Arthur Rank had become the major producer of films in Britain, distributing them automatically through his circuit houses. He grouped within his organ-

ization a number of so-called independent companies who depended on him for studio space but had a relatively free hand in the design of the films they wished to make. The results were the very differing styles exhibited by British films as made by the small companies like Cineguild, Archers Productions, Charter Films, Pascal Productions, Individual Pictures and Rank's directly controlled companies, Gainsborough and Two Cities, and the genuinely independent studios like Ealing and Riverside, whose product was distributed by the Rank organization.

A great deal was said outside and inside the industry for and against the monopolistic encroachments of the Rank organization. It was the subject of a government inquiry, the results of which were published in 1944 by the board of trade under the title *Tendencies to Monopoly in the British Film Industry*. Among its recommendations was an appeal for government protection for the independent film producer. The board of trade was too pre-occupied with major postwar legislation to give much attention to consideration of the film industry, though it was as anxious as the industry itself to expand the overseas market for British films. Expenditure by Britain on renting U.S. films between Sept. 1939 and Jan. 1946 was stated by the chancellor of the exchequer to have been £82,600,000.

With the return of studio space to the industry by the government (completed during 1946) and the demobilization of servicemen who previously had been studio technicians, it was hoped that the number of feature films produced would rise rapidly. The average productivity during the war years had been around 60 features annually. After the war a number of fine films showed that peacetime production did not lag behind wartime artistic standards; these included *The Seventh Veil*, *Dead of Night*, *The Captive Heart*, *The Rake's Progress*, *Blithe Spirit*, *Henry V*, *I Know Where I'm Going*, *A Matter of Life and Death*, *Brief Encounter*, *The Overlanders* and *Men of Two Worlds*. There was also the ambitious *Caesar and Cleopatra*.

During the war the documentary film played an important part in the public information services. Government films were distributed freely and shown regularly in the cinemas, feature-length official films, like *Target for Tonight* and *Western Approaches*, were rented by exhibitors and the nontheatrical audience attending programs made up entirely of documentary shorts rose to 10,000,000 a year, mostly attending road shows given by government mobile units in factories, schools, village halls and to audiences organized by the many voluntary bodies in Britain and by the civil defense workers. These shows, consistently popular and demanded by the public beyond the capacity of operators and equipment to meet the need, were a revolution in public education. They were to remain a permanent part of the official educational provision for children and adults. Films were commissioned by the ministry of information and the services and were made mostly by independent documentary units. The chief services also had their own film production units; the prewar official General Post Office (G.P.O.) unit became the enlarged Crown Film unit which made notable war documentaries. Hundreds of films were produced on service training, agriculture, engineering, health, domestic problems, citizenship and information about Britain and other nations. Many films were imported from the commonwealth and Allied countries. The British council commissioned a number of films about Britain, its indus-

tries, science and medicines for showing overseas; and the government Colonial Film unit specialized on a small scale with the development of documentary as part of the educational system of the African native. Documentary, ten years old when war broke out and little known by the greater public, came into its own. Outstanding films included the war record series from *Desert Victory* to *The True Glory*, films of social problems like *The World of Plenty* and medical studies like *Surgery in Chest Disease*.

British Commonwealth.—The greatest activity in film production in the British commonwealth was John Grierson's wartime expansion of documentary in Canada. This was parallel to the British expansion. Distribution of Canadian documentary was on an international scale both theatrically and nontheatrically, especially in Britain and the United States. Nontheatrical audiences in Canada included 500,000 factory workers and farmers meeting monthly. The National Film board annual production rate reached more than 200 films, the best known of which was the *World in Action* series. Film subjects included agriculture, education, art, health, history, geography and industry as well as war subjects. Special discussion films had been prepared to give a lead to discussion groups primarily organized by the trade unions. Grierson left the Canadian Film board in 1945 to found a documentary research and production organization based in America to serve world audiences with films on world problems. It should be remembered that Michael Powell's important film *49th Parallel* was made in Canada in 1940.

Film production in South Africa was practically negligible, and only a very small number of feature films were made before the war in Australia. Both countries supplied a few documentaries on their lives and industries during the war. Thorold Dickinson's outstanding film in Technicolor, *Men of Two Worlds*, was prepared in Africa (Tanganyika Territory), though much of it had to be reconstructed and produced at the Denham studios. It was an authentic study of African problems. Similarly, Harry Watt spent two years in Australia making *The Overlanders* and acting as adviser to the Australian government on film production.

India had a large film industry capable of making about 200 feature films a year, and a number of units based on Bombay made educational and documentary films. The feature films were shown in some 1,400 theatres which showed Indian films only. English-speaking films were shown in about 230 theatres. The Indian films were noted for their length and their love of extensive dialogue, and it was rare for them to reach a high level of production value, as, for example, in the case of *The Unexpected*, produced in Bombay by Shantaram, a social film on a Hindu girl's successful resistance against the rigid conventions of Hindu marriage custom.

Continental European Films

The fateful ten years from 1937 to 1946, which saw the rise and fall of Hitler's new order on the European continent, had also a strong impact upon the European cinema. Although no major evolution took place in film technique, the more significant changes of a psychological nature became effective in the social and artistic spheres.

The German film industry, at the time of Hitler's rise, was among the leading in the world for quality, and as to quantity, second only to Hollywood. It was singled out by the nazis to become their foremost propaganda instrument. This process, which was only gradually driven forward

with the growing self-assertion of the nazi regime, was characterized by two traits: one, the application of the nazis' totalitarian and racial principles to the film industry and its personnel, the artistic and technical as well as the administrative; the other was the reorganization of the industry under strict state control, with a view to securing a production completely subjected to their propaganda and psychological requirements. The former had already been effected by 1937, and many of the personalities responsible for the high international reputation of the German film (e.g., Eric Pommer, the producer, and Fritz Lang, the director) had chosen to carry on their vocations in Hollywood or London, Paris, Prague or Vienna.

The phase of artistic leadership of the German cinema had virtually ended by 1937. One and two years later respectively, the studios of Vienna and Prague were also fallen bastions.

Up till then, Czechoslovakia as well as Austria had had a flourishing production of its own, the best examples of which found world-wide distribution. Those Czech film technicians, writers and artists who, after the invasion of their country, had been able to escape, carried on in exile. Czech production units were formed both in the U.S.A. and Britain; the latter unit, apart from documentaries, turned out two major films, one on Lidice, the other a *Schwejk* subject; co-operation from British film units was secured. Refugees from other invaded countries did the same, and Britain saw Polish, Dutch, Norwegian, Free French and Belgian film units operating during the war. This remarkable development indicated the growing awareness of the governments that film production had become an integral part of national existence, even in exile.

In Germany, the first stage of the nazi cinema lasted until approximately 1939. The bulk of German production consisted of the average type of entertainment film, with a distinct sprinkling of major subjects promoting the nazi myth: films glorifying the political gangsterism of the *Frei Korps* in the early years of the Weimar republic, or nazi heroes like Horst Wessel or the Hitler Youth movement (*Hitlerjunge Quex*) or the German minorities in other countries, the fifth columns of the future.

The second, more-outspoken phase of the nazi cinema began in 1939, with Hitler's power so stabilized that he felt ready for actual war. Film financing, production and distribution were completely concentrated and firmly activated for psychological warfare both at home and in other countries. A few producing companies centred in Berlin, Vienna, Munich and Prague were left. Importation of foreign films came almost to a standstill, while in the production schedules the number of escapist films in the Viennese operetta style was reduced. Four types of production could now be clearly discerned: (1) Semidocumentaries, such as *Baptism of Fire* presenting the Polish campaign of 1939, with the purpose of impressing upon other nations Germany's invincible power. (2) Historical films about Prince Otto von Bismarck or, once more, Frederick the Great, giving the nazi version of history. To this category could be added those anti-Semitic films of which *Jew Süss* was an outstanding example of fallaciousness. (3) Topical entertainment films with insidious propaganda directed against the countries at war with Germany; examples were *Ohm Krüger*, with the Boer War as background, a violent anti-British film, or *G.P.U.*, which attributed gestapo methods to the soviet regime. (4) Biographical films on outstanding Nordic personalities of the past—such as Bach, the composer; A. F. Menzel and Rembrandt van Rijn, the painters; Robert Koch, the bacteriologist—interpreted according to the nazi creed. After the collapse of the third reich,

Below: Two of the principals in the Swiss motion picture *The Last Chance*, an account of a small band of refugees fleeing nazi persecution, which was chosen one of the ten best films of 1945 by the National Board of Review

attempts to revive German film production were made during 1946 under Allied supervision. A Russian licence was granted to Deutsche Film Aktiengesellschaft (D.E.F.A.), which had begun producing in Berlin; so also had Studio 1945 under a British licence; for the U.S. authorities Eric Pommer was about to reorganize production in Berlin and Munich.

The principles outlined above were not confined to Germany, but applied to all the countries under axis influence. The French cinema had by 1937 entered a very promising stage. It is sufficient to point out the poet René Clair, the psychologist Jacques Feyder, the painter Jean Renoir, the technician Julien Duvivier, the physician Marcel Carné and the martyr Jean Vigo, who were pioneers of art in the world of the film. When war and occupation clamped down on the French studios, few directors and artists of reputation were ready to collaborate. Some went on working under the strain of avoiding any political and ideological concessions; films such as *Goupi*, *Mains rouges*, *Les visiteurs du soir* and *L'éternel retour* were the outcome. Other cineastes managed to escape and carry on their work in other countries. A good many went underground, with Pierre Blanchard as their leader. The film *Pontcarral* (1942) even achieved a certain amount of subtle antinazi propaganda, which went undetected by the Germans. After the liberation, the French cinema could again draw on its inexhaustible reservoirs of talent. Jacques Becker, Robert Bresson, Jean Cocteau, Claude Autant-Lara, Henri Calef, René Clément and others were again carrying on the tradition of high artistic standards which so distinguished the French cinema.

While the French film inevitably had to suffer through the course of the war, other film-producing countries profited by it. Italian film production was artificially inflated by means of large financial support from the fascist regime, and quality by no means kept pace with quantity. The same applied to the then axis satellite Hungary. The end of the regime in Italy, however, gave rise to a fresh production effort in a very different spirit. The Italian film was a growing factor, and its greatest achievement *Rome—An Open City* (1945-46) by Roberto Rossellini, an outstanding example.

Different again was the effect upon the neutral countries. Countries like Sweden and Switzerland, more or less cut off from the outside world and with German propaganda films forced upon them, were induced by this situation to increase and improve their own production effort. In such a small country as Switzerland, existing conditions were bound to limit production, but among the films made, several of them based on classic works by Gottfried Keller, two pictures stood out, both directed by Leopold Lindtberg: *Marie-Louise* (1944) and *The Last Chance* (1945). Sweden, on the other hand, had an old tradition of film making dating from the silent days. Its studios, while not upholding the artistic standards of Mauritz Stiller and Victor Sjöström, were turning out an annual average of 30-50 features, thus becoming one of the major European production centres. The most outstanding achievements during the war were *Himlaspalet* (1942), with a religious background, by young Alf Sjöberg and *Anna Lans* (1943). Sweden's best film of 1945 was *Blood and Fire*. While themes of psychological character, such as *Frenzy* and *Waiting-Room of Death*, were the specialty of the ambitious young school of Swedish cineastes, a good many light comedies, too, were being made and Niels Poppe, Sweden's outstanding comedian, was hailed as the Swedish Chaplin.

The other Scandinavian countries, of which Denmark especially had a production of long tradition though small in output, were less fortunate. Film activities in Norway and Denmark, naturally, almost ceased under occupation. But after their liberation each of them gave artistic expression to their sufferings by means of the cinema. The Norwegian resistance film, *We Want to Live*, as well as the Danish *Red Earth*, were admired for their quality. Belgium and the Netherlands similarly resorted to their painful experiences as background for films on their resistance movements.

Of all neutral countries, however, Spain was to profit the most. Shortly after the Civil War, the government entered into a policy of systematically encouraging film production. No fewer than 977 features were completed within the 6 years from 1939 to 1945. Quality, while at first a secondary consideration, improved considerably after 1943. Higher artistic standards were now being encouraged with a view to possible exports to Latin-American markets. The best Spanish film of 1944-45 was *Ines de Castro* and of 1945-46, *Los Ultimos de Filipinas*.

The cinema in the U.S.S.R. too, underwent a significant change when in 1935-36, *Peter the Great* was made by V. Petrov, the first soviet film portraying tsarist history. A good many similar subjects followed, including *Alexander Nevsky* (S. Eisenstein, 1936) and *General Suworov* (V. Pudovkin, 1939). During the war, with part of the Russian studios occupied or destroyed, and others transferred to safe regions, prestige production, such as *Ivan the Terrible* by Eisenstein, was centred on historical and biographical films of great figures of the past to stir the nation's patriotism. Another type was the documentary on war topics, guerrilla warfare or feature films of a semidocumentary character, showing the sufferings caused by the aggressors and partisan heroism (*Rainbow* and *Girl 217*). Entertainment films were largely musicals (*Spring Song* or *Musical Story*). Production after the end of the war naturally turned to subjects such as the battle of Stalingrad (*Nights and Days of Stalingrad* and *The Turning Point*). Soviet Russia, more than ever, seemed aware of the importance of its film industry. A vast construction program for cinemas was inaugurated in 1945. Production was decentralized, with studios in all the various soviet republics. Special attention was paid to the development of a new stereoscopic system, under the direction of the inventor, Semyon Ivanov.

(H. H. W.; R. MAN.)

Technical Developments

Silent and sound motion pictures were used by U.S. armed forces throughout the world. This use included the production of training films in motion-picture studios and military camps, production of public information pictures such as *Desert Victory* and *Fighting Lady*, aerial and ground combat pictures. Both 35-mm. and 16-mm. were used with much of the aerial combat work done by automatic 16-mm. cameras. Much was learned about operating camera equipment under extremely difficult climatic conditions, from the high temperature, high humidity of the South Pacific to the very low temperatures encountered in high-altitude bombing and reconnaissance.

In the war-torn countries of Europe, the production of entertainment pictures was seriously hindered and in many cases stopped completely. Equipment and parts were largely irreplaceable when they were destroyed or worn out. The studios themselves were diverted to other uses and many were destroyed. After the war studios were in the process of being rebuilt and new equipment being provided; but in Italy, France, and Germany production

was still on a very limited basis handicapped by the lack of studio and equipment facilities. Mexico, which saw a major development in the motion-picture industry with the construction of at least two new large studios, gave promise of becoming one of the important producing countries, particularly for pictures to be distributed in South and Central America.

Standards.—The Society of Motion Picture Engineers was continuously at work on standards for the industry. The Research Council of the Academy of Motion Pictures Arts and Sciences was also active in this matter, and their combined activity, stimulated by temporary standards adopted as a wartime measure, resulted in many new U.S. standards, which were to be presented by the American Standards association for international standardization. The activity on standardization continued to be reported twice a year in the *Journal of the Society of Motion Picture Engineers*.

Cameras.—In the 35-mm. professional motion-picture camera field, the decade 1937-46 saw a series of refinements looking toward quieter operation without sacrifice of reliability and ease of operation. The quest for reduction in camera noise was, of course, a result of the desire on the part of the cameramen to free themselves from cumbersome camera "blimps" and other devices required to permit the operation of a noisy camera in interior scenes involving sound recording.

The Mitchell NC camera was supplemented by the BNC camera, essentially the same except for the addition of sound-absorbing material in the external case for both the camera and the magazine. Before the war, the DeBrie camera, made in France, was used extensively in that country, in Germany and in England. Some studios, notably 20th Century-Fox and RKO, designed and built their own cameras. Technicolor continued to use a camera permitting the simultaneous exposure of three negatives. Two of these negatives were handled as a "bipack" with the third negative exposed separately. By the introduction of a filter prism combination the dual purpose of separating the light into two colour bands and directing each band to the desired film was accomplished.

In the fall of 1946 the Mitchell Camera company announced a 16-mm. professional camera similar in all details to its 35-mm. professional cameras. This appeared to be an important step in the professional use of 16-mm. film.

Optics.—The most important development in the camera lenses was that of coating processes designed to reduce the reflection of light from the lens air surfaces. Such coatings were improved as to hardness and permitted cleaning the lenses in a normal way. At the same time the efficiency of light transmission through the lenses was heightened, and perhaps of most importance the definition of the exposed image was improved, eliminating from the lens systems stray light resulting from reflections from lens surfaces.

Since cameramen must work with different lenses, a knowledge of the light efficiency of the lenses became necessary with laboratory development on a time and temperature basis. For this reason some studios arbitrarily changed the f./diaphragm calibration so that lenses of the same focal length when set at the same f./stop had the same efficiency of light transmission.

Camera Booms.—The requirement for increased mobility of cameras prompted the design and construction of a variety of camera dollies and booms. Among the camera booms constructed were relatively small ones, as developed by MGM, and very large ones in use in practically all of

the studios. In some of the larger booms the camera, in addition to being swung in whatever arc might be desired, could also be raised 20 ft. above the floor of the stage. Thus, three simultaneous motions were possible; the dolly on which the boom was mounted could be moved along a track; the boom arm could be rotated and raised or lowered, thus permitting spectacular photographic effects.

Process Photography.—By 1937, most of the process photography in use in the industry was of the so-called background projection type. In this method an especially prepared motion picture or still picture was projected by a special projector on a translucent screen. The action took place in front of this translucent screen and the camera photographed the action and the background as depicted on the translucent screen. In its first uses this system was somewhat crude and limited to light values on the process screen which were barely sufficient for black-and-white photography, and thus insufficient for colour photography. Black-and-white process work of this type was progressively improved until it reached a rather high state of perfection. Colour work also became possible and was in regular satisfactory use. In the case of still pictures projected in colour, processes were developed for transferring or cementing colour prints onto glass to prevent buckling under the high temperatures existing at the emulsion. In some cases the use of heat-absorbing water cells and suitable shutters further increased the permissible light intensity. Where a moving background was required in colour, triple-head projectors were developed by various studios to permit increasing the light on the process screen without increasing the heat on the film.

Film.—Finer-grain panchromatic picture negative stocks were produced and adopted generally throughout the industry during the decade. These included Eastman Kodak's Plus X (1231) for general work, Super XX (1232) for use where a high-speed emulsion was required and Background X (1230) for background process exterior plates; DuPont's Superior No. 1 (104) for background process exterior plates; Superior No. 2 (126) for general work and Superior No. 3 (127) where higher speed was required. Special infra-red picture negatives were also produced, including Kodak Infra-red Negative (1210) and DuPont Infra-D (105). The first commercial use of fine-grain emulsions was probably in the duplicating field where Kodak produced its duplicating positive type 1365 and duplicating negative type 1203. DuPont offered its master-positive type 228 and panchromatic duplicating negative type 108.

For release prints and sound-recording negatives in the black-and-white field, the use of fine-grain emulsions was adopted as standard throughout the industry. These included Kodak type 1302 and DuPont type 225 for release prints, Kodak types 1372 and 1373 and DuPont types 226, 232 and 236 for sound-recording negatives. Various types shown were developed for special applications in connection with variable-area or variable-density sound-recording methods.

Magnetic Recording.—Magnetic recording, as a possible motion-picture tool, was again under active consideration because of the development of iron oxide as a magnetic material used either impregnated in a plastic base or coated on a plastic or a paper base. Although the quality of such recording seemed adequate, it was too early to predict what application of it would be made.

Theatre Equipment.—At the beginning of 1936 an important advancement in sound reproduction in theatres

had occurred—the introduction of the rotary stabilizer sound-head. About that same time, two-way theatre speaker systems were also introduced. These two improvements resulted in considerable improvement in sound quality in the theatre; they also forced the attention of the Research Council of the Academy of Motion Picture Arts and Sciences on the problem of standardization in theatres. Standard practices were recommended in the field of amplifier power capacity, frequency characteristics and maximum permissible flutter. The research council prepared and made available to theatre service engineers a test reel made up of samples from various pictures.

Colour.—The three-colour imbibition process was in commercial use by Technicolor at the beginning of the decade and continued to be recognized as the best commercially available colour process. Technicolor's plant was enlarged, and the equipment and process were continuously refined. In 1944 the first complete picture was produced with the Technicolor-Monopack original process. Colour separation negatives were made in the laboratory and release prints were made by the imbibition process. A number of pictures were made by this process.

Two-colour processes were also in commercial use, including the Magnacolor and later the Trucolor processes as developed by Consolidated Film Industries and the Cinecolor process.

Before World War II it was known that Agfa in Germany was actively at work on three-colour multilayer films, both for reversible processing and for negative-positive processing. Various reports coming out of Germany, during the war and after, claimed that Agfa had developed for commercial usage the multiple-layer three-colour negative-positive process. Various techniques, such as dissolves, fades, wipes and others commonly used in the industry, presented problems which had not yet been satisfactorily solved. In the United States, Ansco made available, on a limited basis, multiple-layer three-colour reversible stocks for commercial use. Probably the various special effects required for motion-picture work could be handled with this film. The film, however, presented a new soundtrack problem because the dye-type track resulting was largely transparent to infra-red light, unfortunately in the range of both peak emission from a Tungsten light source and peak sensitivity in the photoelectric cells commonly used for sound reproduction. A blue-sensitive photoelectric cell became commercially available. Satisfactory reproduction of both black-and-white silver image sound tracks and dye-type soundtracks obtained with the Ansco process seemed possible with this new cell. The change required in theatres appeared to be of a minor nature. Commercially, no feature pictures had yet been produced and released with the Ansco process and except on an experimental basis, no blue-sensitive photoelectric cells were in use in theatres.

In the 16-mm. field, Ansco released two new reversal three-colour films, types 234 and 235, while Eastman introduced Kodachrome, type 5268. In 1943 Technicolor began the production of 16-mm. three-colour imbibition prints with blue soundtracks. The utilization of this process was largely in connection with 16-mm. reduction from 35-mm. Technicolor feature pictures, many of which were produced during the war for the entertainment of military personnel.

Sound Recording.—In sound recording, refinements were carried on progressively by the motion-picture studios and by the sound-equipment manufacturers. The variable area

type of recording was adopted by a number of the major motion-picture producers in the United States. With the increased usage of this system it became evident that a truly linear recording system was not desirable for reproduction under theatre conditions. As a result there was developed a variable gain amplifier which automatically compressed the average volume range of the recording to meet existing theatre conditions. A similar condition had previously been obtained in variable density recording by operating over the nonlinear portion of the photographic characteristic of the motion-picture film. Push-pull recording, both variable area and variable density, was adopted by a number of producing studios. New recording equipment and new speaker systems and theatre-reproducing equipment were also introduced by equipment manufacturers; each new equipment provided an improvement over that previously available.

In addition to the use of control-track and multiple-track recording as mentioned below under the section on *Animated Cartoons*, the industry took into consideration the possibility of improvement in the presentation of its shows by such devices. The Radio Corporation of America introduced to the industry a simple control-track system which could be used with standard release prints, permitting an increase in volume range and a spreading of the source of sound in theatres equipped to enjoy this improvement. At the same time it did not interfere with the normal reproductions in theatres not so equipped. Warner Brothers installed modified equipment of this general type in five theatres and released a number of pictures employing this control track. The industry in general, however, was unable to reach agreement on the subject; and the advent of the war caused a cessation of the activity. Although it was discussed again after the end of the war, no action had been taken or was contemplated at the end of the decade.

Western Electric demonstrated a three-soundtrack and control-track system of stereophonic recording and reproduction. No commercial use had yet been made of this system. Twentieth Century-Fox, in co-operation with several manufacturers, investigated the possibility of a multiple-track stereophonic recording system coupled with a 50-mm.-width film.

The close of the war brought with it the introduction of new sound-recording and reproducing equipment, all of which again represented an improvement over the equipment available before the war.

Laboratories.—Before the advent of sound, cameramen decided the lighting for scenes according to what, to their eyes alone, seemed adequate. Similarly, laboratories developed picture negatives by hand to the densities which they believed, from years of experience, would prove desirable to the particular cameramen. Sound, however, required accurate exposure and correct development, both of which were beyond the limit of proper judgment. Development to a specified gamma and density, along with other problems, necessitated the use of machines for developing sound negatives and prints and in the release laboratory required the use of machines for developing composite picture and sound prints. The practice slowly spread of including the development of all picture negative and print material by developing machines under accurately controlled conditions. This increased the desirability for the cameraman to determine his exposure by the use of exposure meters, a practice which became almost universal in the industry.

Laboratory techniques and equipment were improved considerably. New printers in both the 35-mm. and 16-mm.

fields, contact and optical, were introduced to the industry. Improvement in sound printers took place in the early part of the decade. Considerable additional improvement was known to be possible and was, in fact, realized in special printers developed and in use in one of the Hollywood studios. New developing machines were also placed in operation. Twentieth Century-Fox was reported to have, at their studio laboratory, machines wherein the directional effect had been essentially eliminated. Consolidated laboratories at Fort Lee, N.J., had in operation high-speed continuous-release print machines wherein the actual printing operation, the complete developing operation and the inspection of the finished print was a continuous high-speed process. This equipment was reported to operate at between 300 ft. and 400 ft. per minute.

Lighting.—The trend toward the use of tungsten filament lamps for set lighting increased steadily, although carbon arcs were still in use to a considerable degree because of the high intensity of the light obtained, its white character and concentrated source. The white colour was highly desirable for colour photography. Electrical and acoustical noise conditions disturbing the sound recording when carbon arcs were used had largely been overcome by improvements in the carbons and the lamps and the use of various types of electrical filters in the power supply circuits to the arc lamps. Tungsten lamps were also improved.

Perhaps the most interesting development in set lighting was the "increased-range" (I.R.) system developed by Dr. Alfred M. Goldsmith, wherein a considerable increase in the depth of focus was obtained by separately illuminating the foreground and one or more sections of the background by a flash lighting system. This lighting method, coupled with proper camera equipment, was demonstrated capable of improving the background detail without in any way sacrificing foreground detail. The system was complicated and for this reason had no commercial application at the close of the decade.

Animated Cartoons.—Walt Disney's first feature-length cartoon illustrating classical music, *Fantasia*, was presented to the public in two forms: On a roadshow basis it was presented in several U.S. cities with the picture on one film and three soundtracks accompanied by a control track on a second film. These two films were run in electrically interlocked machines to provide accurate synchronization between sound and picture. Three primary speaker systems were installed in the theatre: One centre stage, one left stage and one right stage. In some theatres additional speakers were also installed in the balconies and along the sides of the main floor of the auditorium. By reason of the three soundtracks, each with its own channel, the music was reproduced in whichever of the speaker systems was appropriate for the action shown on the screen. The volume of reproduced level was automatically controlled by the control track, which permitted a much wider range and more realistic reproduction than would be possible with a normal soundtrack. In one section of this picture, special switching arrangements were automatically brought into play to cause the voice of a singer to come from auxiliary speakers in the rear of the house while the music came from speakers behind the screen. A standard release was also made of this picture with a normal composite print containing a single soundtrack on the same film with the picture.

In order to improve the realism of animated cartoons, Disney's engineers developed and manufactured a multi-plane camera device permitting the various cells required for a given scene to be located at different distances from

the camera. This created an impression of depth in the picture which could not be obtained were the complete drawing to be photographed in a single plane.

In the *Speaking of Animals* series of short subjects produced by Scientific Films, animals were caused to speak by a process of combining animated drawings with actual photographs of animals. The synchronization of the animated lip action with the wanted dialogue was remarkably good and had a most entertaining effect.

Newsreel Equipment.—Before and during the war, single-film systems wherein sound and pictures were photographed on the same negative were further developed and refined. Military forces made large-scale uses of such equipment. An example of the quality which could be obtained with such systems was shown in the documentary picture produced by "March of Time" in the early stages of the war and released under the title of *The Ramparts We Watch*. (W. V. W.)

Educational Films.—Educational film statistics for the decade 1937-46 revealed a tenfold increase in the production, distribution and utilization of such films. Although the film had found its voice ten years before 1937, the use of sound in 16-mm. educational films was still comparatively new.

The greatest impetus to expansion of the use of films in education resulted from the extraordinary success of training films used by the U.S. armed forces in World War II. In 1943, the U.S. government became the largest producer, distributor and user of films. During the war period, U.S. expenditures for training films amounted to about \$100,000,000—more than the schools, colleges and community organizations had spent on educational films in the entire prewar history of visual education. Indeed, the U.S. government in 4 years produced 6 times as many educational films as had been produced during the previous 50 years. The armed forces completed approximately 3,900 training films, of which 2,700 were for the army and 1,200 for the navy. The U.S. office of education within a similar period completed 450 visual-aid units, each consisting of a sound motion picture, a filmstrip and an instructor's manual, for use in industrial training. Experts estimated that films increased the speed of training 25%-35%.

Of greatest significance to educators was the new emphasis on techniques of utilization. Teachers recognized the extraordinary power and versatility of the film in building information, skill and morale.

The U.S. armed forces had purchased approximately 54,000 sound projectors—32,000 for the army ground and air forces and the rest for the navy. However, only a small percentage of these projectors became postwar surplus. Most projectors were lost in action or worn out. Only a few thousand usable army and navy projectors remained, mainly in the Philippines and in Japan.

Approximately 35,000 16-mm. sound projectors were in educational use at the end of 1946. About 85% of these were in the United States. No accurate report of projectors in the U.S.S.R. was available, but informed sources revealed that the soviet government was striving to match the United States in this field, with some estimates running as high as 40,000 machines of all types, silent and sound, in operation in Russia during 1946. Most of these were probably silent machines. In India, Indonesia and China educational sound films were virtually nonexistent. In Latin America, the activity was considered to be about 5% of that of the United States.

On Nov. 14, 1946, the United Nations Information office in New York divulged plans for the production of a United Nations newsreel for release in 16-mm. to schools, colleges, churches and community groups, under the direction of Jean Benoit-Levy, noted French educational film producer, and in co-operation with the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.). The United Nations' plan was to follow the channels of distribution used by the U.S. Office of War Information. The OWI reported in 1945, on the completion of its job, that during the 37 months of its operation, 77,387 prints of 177 subjects were released through 324 established commercial and educational distributors. These were shown to a total audience of about 276,000,000 persons in more than 1,000,000 showings.

During World War II the Office of the Coordinator of Inter-American Affairs released about 80 sound films on Latin-American life, including some notable reels made by Walt Disney and by Julien Bryan. In 1946 the latter organized the International Film foundation, which sent camera crews to Europe and the orient for new documentary films on Poland and the U.S.S.R.

The British Information services, during the war years, produced and distributed 415 short film subjects, using an average of 35 prints of each subject. Most of these films were of temporary value during the war. The British organization later moved into the educational field with 110 subjects of more lasting value. During 1946 the British Information services circulated 5,000 prints through its own film exchanges and 5,000 additional prints through other educational libraries. Greatest in demand were the film versions of scenes from Shakespeare's *Julius Caesar* and *Macbeth*, of which an unprecedented number, said to be 1,000 prints of each, were in use at the beginning of 1947.

The British Film institute published in 1946 a report on German educational and propaganda films, indicating that on Jan. 1, 1944, all schools in Germany that had electricity were equipped with projection apparatus. At that time there were in Germany 45,346 projectors, mainly silent, and 592,000 prints of 16-mm. films, so that approximately 66% of the German schools were so equipped. During the war Germany had a ratio of 2 projectors to 3 German schools, as against 1 projector to 15 schools in Great Britain and the U.S.

Anticipating the greatly expanded use of films in civilian education after the war, the University of Chicago in 1943 established itself as a world centre for the development of classroom films. Having acquired Encyclopædia Britannica, Inc., by transfer from Sears, Roebuck and Co., the University of Chicago set up Encyclopædia Britannica Films Inc. as a subsidiary organization. It acquired from Western Electric company, on Dec. 3, 1943, the Erpi producing organization, headed by V. C. Arnsperger, and a notable library of 200 teaching sound films (increased to 250 by the end of 1946). The university also received by transfer from the Eastman Kodak company, on April 12, 1944, its library of 250 silent Eastman Teaching Films. Production of about 50 additional school films enabled Encyclopædia Britannica Films Inc. to begin the year 1947 with 500 subjects in its expanding catalogue and to become the world's largest producer and distributor of educational motion pictures. More than 100 of its subjects were dubbed in foreign languages and were available for export. Most widely used of the Britannica films were those in physics and human biology. Most popular of

the elementary Britannica subjects were *Adventures of Bunny Rabbit*, *Farm Animals* and *Gray Squirrel*.

Most notable among the new firms in the field was Coronet Instructional Films, which launched its U.S. sales program in May 1945. All Coronet instructional films were produced on 16-mm. colour stock. Other new firms included Simmel-Meservey and Young America Films, whose output at the beginning of 1947 was not yet sizable enough to evaluate.

The action of Eastman Kodak and Western Electric, as manufacturers, in divesting themselves of their educational film production and distribution departments in 1943-44 was followed in 1946 by the similar action of Bell and Howell company. That company disposed of its Filmosound library of 6,000 short subjects and features to Universal Pictures, through a new subsidiary organization closely affiliated with the British companies of J. Arthur Rank, leading international film industrialist. Consummating this unique transaction, Universal announced, on Nov. 14, 1946, the formation of United World Films, Inc., for the production and world-wide distribution of 16-mm. and 8-mm. educational, religious and family-entertainment films. For the first time a major film distributor undertook to embrace all phases of the 16-mm. field by the acquisition of the operating personnel and distributing system developed by a leading equipment manufacturer.

Thus, by the end of 1946 film-equipment manufacturers, having nurtured the infant nontheatrical film industry during its formative years, felt that the industry could at last stand on its own feet.

During the 1937-46 decade, about 600 local, state and national film libraries were developed in the U.S. These included the expanded libraries of city and county school systems, state departments of education, university extension bureaus and commercial organizations. Some idea of the expansion of such libraries during the ten-year period may be gained from the following reports:

Films Incorporated handled five times as many bookings in 1946 as in 1937; Ideal Pictures corporation, 20 times as many; Filmosound (later United World), 8 times as many. The Ohio state department of education handled 16 times as many, reporting an average daily shipment of 800 pictures in 1946, compared with an average daily shipment of 50 pictures in 1937. The University of Texas extension division, which reported 11,000 film bookings in 1937, reported 33,000 in 1946; the St. Louis board of education in 1937 had 531 prints in its film library; in 1946, it had 3,547. Film deliveries to St. Louis schools in 1937 were 8,841; in 1946, 22,485.

The Chicago board of education in 1937 had only 16 sound projectors; in 1947 it had 600—more than any other city in the world. In 1946 Chicago schools had 10,000 sound-film prints, 25 times as many as in 1937. The Chicago schools, like those of many other cities, were rapidly discarding most of their silent films. The Pennsylvania State college began its film library in 1936-37 with 100 prints; by 1947 it had 1,400. The University of Oklahoma in 1937 handled an average of 80 film bookings a week; in 1946, 220 bookings a week. The Denver schools handled 623 bookings in 1937 and 3,000 in 1946.

Indiana university, from small beginnings, expanded its service so that during the academic year 1946-47 its extension division was booking its films at the rate of 15,000 reels a month. During the summer of 1946 the university added more than 1,000 prints of films to its library.

L. C. Larson, head of the Indiana university film activity, forecast in 1946 that U.S. schools by 1950 would own

at least 200,000 projectors, or 1 projector for each 5 teachers. The American Council on Education recommended in 1945 a tenfold increase in the number of projectors for use in U.S. schools. The state-wide program in Indiana, typical of programs planned in other progressive states, was officially approved in 1946, so that state aid became available to all Indiana schools in proportion to the number of pupils. Inevitably other state departments of education would set up minimum standards for the utilization of educational films.

The Virginia legislature in 1945 appropriated \$1,112,000 for visual aids in the schools during the ensuing academic year. One of the first orders under this budget was for about 2,500 reels of Encyclopædia Britannica classroom films. In 1946 Virginia conducted a state-wide series of institutes for the development of higher standards in the utilization of school films. Other states conducting notable summer conferences included Michigan, Wisconsin and Oklahoma.

Hollywood's interest in classroom films resulted, in 1945, in the establishment at New Haven, Conn., of a research centre for text films under the direction of Gardner L. Hart, in association with the American Council on Education. In 1946 a group of 7 educational publishers (Harcourt, Brace and Co., Harper and Bros., Houghton Mifflin Co., Henry Holt and Co., Macmillan Co., Scott Foresman and Scholastic) sponsored a survey to determine where the textbook publisher, with his editorial and sales experience, might best participate in the development of educational films. A final report based on the survey was scheduled for publication in 1947. In the meantime, the group of publishers was participating with the group representing the American Council on Education and the Hollywood group at New Haven in the planning and production of five or six experimental films. These films were being financed by the Hollywood studios.

New York city in 1946 was planning a vast expansion of the use of films in its schools. Rita Hochheimer, in charge of visual instruction, recommended an initial budget of \$7,000,000 and thereafter \$3,000,000 annually to modernize teaching methods with the aid of films. She recommended the appointment of film co-ordinators in each of 800 schools. The New York city board of education thus had under consideration a plan to spend annually 60 times as much for visual instruction per year as it had spent during any previous year.

In 1946 St. Louis was spending \$1.17 a pupil per year for visual instruction; Providence, R.I., \$1.13; Rochester, N.Y., 85 cents; Newark, N.J., 79 cents; Buffalo, N.Y., 65 cents; Los Angeles, Calif., 55 cents; Washington, D.C., 35 cents and New York, 7 cents.

Meanwhile, the demand for 16-mm. sound projectors far exceeded the available supply. Equipment manufacturers reported that they were selling 20-25 times as many machines as in 1937.

The MGM studio took the lead among major film companies in 1945 in setting up a 16-mm. department in its laboratory, under the general direction of Arthur M. Loew, head of Loew's International corporation. Loew later organized a world-wide distribution of MGM films in 16-mm. He pointed out in 1946 that schools in other countries were showing interest in the educational values of features dealing with literary and historical subjects such as *A Tale of Two Cities*, *David Copperfield*, *Treasure Island* and *Mutiny on the Bounty*, when offered inexpensively in 16-mm. While MGM films were made available in 16-mm. mainly outside the U.S. and Canada, RKO Radio films in 1946 were offered in 16-mm. everywhere,

including the U.S., following the theatrical run of each subject.

During this period, new curriculum units in photoplay appreciation recommended by the National Council of Teachers of English were adopted by about 11,000 teachers of English in the United States. More than 5,000,000 copies of illustrated guides to the discussion of photoplays were published by Educational and Recreational Guides, Inc. Plans for the publication of British editions of these photoplay guides awaited the availability of paper and printing facilities. The world-wide distribution of 16-mm. versions of films of literary, historical and scientific interest gave the photoplay-appreciation movement new impetus in 1946.

During the decade 1937-46 Teaching Films Custodians made available to schools 16-mm. versions of hundreds of short films produced in Hollywood, many of them of genuine educational value, as well as long-awaited 44-min. condensations of notable full-length features. Many teachers viewing the condensed versions expressed a desire for the complete films for school use.

Courses in film appreciation were instituted during the decade in a number of U.S. universities, notably the University of Southern California, Syracuse university and New York university. The cinematography department of U.S.C. included four full-time instructors. N.Y.U. appointed the head of its motion-picture department to a full professorship. Plans for college-made educational films awaited in 1946 the general availability of 16-mm. sound cameras, notably the newly perfected U.S. equipment of J. A. Maurer, Inc. Among the higher institutions developing studios for the production of educational films were Harvard, Syracuse, Dartmouth, Minnesota, Southern California and Penn State.

So-called "free" educational films, sponsored by U.S. industrial firms, were offered to U.S. schools during 1937-46 in generous quantities. Attacks on such films as biased or lacking in authenticity were made in 1945-46 by various authorities. As a result, a group of school administrators meeting at Detroit, Mich., formulated a policy for evaluating the varying quality of free films offered to schools.

Paul Alley, television film editor of the National Broadcasting Co., revealed on Nov. 15, 1946, that approximately 60% of NBC television programs were on film, that there was no indication that this ratio would decrease and that a goodly proportion of the video programs would consist of educational films. Already experiments in the use of Encyclopædia Britannica classroom films had been conducted in New York by NBC and the Columbia Broadcasting system, with indications that when equipment became available the television networks would co-operate in popularizing the presentation of educational films on a public-service basis and without commercial advertising.

Protestant churches in 1945 began to match the interest of the Catholic church in attention to educational film values. The Protestant Film commission, with Paul F. Heard as executive secretary, inaugurated an educational film production program with plans for an initial budget of \$1,000,000.

The number of U.S. periodicals devoted wholly or partly to educational films rose from two to eight during 1937-46. To *Educational Screen* and *Film and Radio Guide* were added *Film World*, *Film News*, *16mm. Reporter*, *See and Hear*, *Hollywood Quarterly*, *Screen Writer*. Many general educational magazines began to

devote space regularly to news of films. Until 1946 the only British periodical devoted to educational films was *Sight and Sound*, a quarterly published by the British Film Institute. A new British monthly, *16 Mil Film User*, appeared in 1946. (See also CIVIL LIBERTIES; PHOTOGRAPHY.) (W. LN.)

Motor-Boat Racing

Except for the first three years of the period, the decade between 1937-46 saw very little development in either racing boats or engines. World War II, which for six years gripped Europe and Great Britain, and into which the United States was drawn in 1941, precluded such development. It was not until the summer of 1946 that those interested in the sport could again turn their attention to the building and racing of high-speed boats.

Between 1937 and 1939, the most noteworthy achievement was the lifting of the speed record by Sir Malcolm Campbell, in the mile trials, from 124.9 m.p.h. made by Gar Wood in "Miss America X" in 1932, to 141.74 m.p.h. This he achieved in his 23-ft. hull "Bluebird," powered with a single Rolls-Royce motor developing 2,000 h.p. In 1937, he set a record of 129.5 statute m.p.h., which he lifted in 1938 to 130.93 m.p.h. and in 1939, with a new hull and the same engine, to 141.74 a record that still stood in 1946.

There were no contests for the British International

(Harmsworth) trophy during the decade, the cup still being held in the United States by the Yachtsmen's Association of America.

The most important U.S. trophy, the Gold cup, was raced for yearly between 1937 and 1941, the best time during those years being made by "Notre Dame," owned by H. Mendelson of Detroit, with a speed for the best 30-mi. heat of 68.6 m.p.h. but still below the 1920 mark of 70 m.p.h. Other Gold cup winners during the period were 1938, "Alagi," T. Rossi of Italy; 1939 and 1941, "My Sin," Z. G. Simmons; and 1940 "Hotsy Totsy III," Sidney Allen. Competition for the Gold cup, and higher speeds, was hampered by the restrictions of the rules, and it was not until 1946, when many of the restrictions were lifted, and the class was placed on a footing where it could become a real factor in boat and engine development, that interest was revived. In that year, the old record of 1920 was bettered for the first time when "Tempo VI," owned by Guy Lombardo, won over 17 starters and set a new heat record of 70.88 m.p.h. for the 30 mi. A new boat from the west coast, Dan Arena's "Miss Golden Gate III" set a new single lap record during the race of 77.911 m.p.h.

The other two power-boat events of national importance in the United States, the President's Cup regatta, at Washington, D.C., and the National Sweepstakes, at Red Bank, N.J., were also suspended during the war period, and were not resumed until 1946. In 1940, at the National Sweepstakes, H. Mendelson's "Notre Dame" set a heat record of 76.14 m.p.h. and a single lap record of 76.923 m.p.h. which still stood for this course at the end of 1946. Racing over the President's cup course saw no outstanding development or speed between 1937 and 1940, and it was not until after the war, in the 1946 race, that a revival started. One of the few new racers built in 1946, "Miss Great Lakes," owned by Albin Fallon of Detroit, set a 15-mi. heat record of 71.181, and a lap record of 74.258 m.p.h. This boat (raced in the Gold cup event at Detroit as the "Miss Golden Gate III"), built on the west coast, was of the three-point suspension type, powered with an Allison engine. It showed great speed in beating "Tempo VI" on the Potomac river at Washington.

"Bluebird II" in which Sir Malcolm Campbell set a new world's water speed record of 141.74 m.p.h. Aug. 19, 1939, on Lake Coniston, England

The other two inboard powered racing classes in the United States that held public interest during the war period were the 225-cu.in. and the 135-cu.in. classes. These were raced on the west coast occasion-

ally during the war period, although there were no regattas of national or international importance, and the boats established some excellent speed records, as the accompanying table of records shows.

The outboard classes also kept going during the latter years of the decade, but the racing was chiefly confined to local regattas, or to those held in southern California and on the western lakes.

On the European continent, there was a total restriction of racing activity which had not been overcome by the end of 1946. Except for a few local events in France, there was no racing in that country, Italy or the Netherlands. Steps were taken in 1946 to revive the International Motor Yachting union, parent body in European power boating affairs.

During the summer of 1946, Sir Malcolm Campbell was preparing to equip his "Bluebird II" with jet propulsion, using a jet engine driving against the atmosphere, and to attempt to better his speed record of 141.74 m.p.h. Experimental tests were made in the Admiralty tank and in a wind tunnel. However, the season was so advanced before he was ready, that the actual trials afloat, and the assault on the record, were postponed. (H. L. Str.)

service were handled by truck while buses and passenger cars moved the bulk of both local and intercity movement of persons. The advances recorded by all these services were the more remarkable when it was realized that they were hampered by scarcity of men and materials; and that in the interest of the war and the national economy, stringent regulations put into effect by the Office of Defense Transportation and other government regulatory bodies called for cuts in the mileage of the bus lines, directed that the routes of intercity bus lines covering much the same territory be consolidated, limited the speed at which vehicles in intercity service were to run, clamped down on sightseeing and charter bus service, curtailed the use of the private automobile, required return loads by the truckers and otherwise provided for the conservation of equipment being used to a large extent in transporting persons to and from war plants and in handling the output of these plants. In the case of all these carriers, the users of the services quickly adjusted themselves to the conservation measures recommended by the governmental agencies and to the similar measures initiated by the carriers themselves. This readjustment was especially marked in the case of the very vital school bus. It was not generally recognized that as many buses were in use carrying children to school as were used to carry passengers daily in the public transportation service. Beset by the same adverse factors that hampered the bus and the truck industries, the school bus service had to be preserved. Here again a remarkable job was done in readjustment to conserve fuel, equipment and manpower.

Motor Transportation

The phrase "ten eventful years" epitomized the situation in the road transport industry over the period 1937-46. The first part of that decade saw a very material growth of both the bus and the truck industries and was marked by a material advance in design and engineering, but great as these advances were they paled into insignificance in the light of the task that the industries were called upon to surmount during the war years. That these two were high among the United States industrial sinews which helped materially to win World War II there was no gainsaying.

During World War I, motor transport was of relatively minor importance, but it assumed vital significance in all forms of activity at the start of the second world conflict. The bulk of the local transportation of property and a considerable part of the tonnage moving in intercity

These general statements were substantiated by the statistics of the industry and buttressed by the printed accounts of the extent of the ingenuity and the resources of management and men.

Long before Pearl Harbor, the impact of industrial production for war had posed a real problem for the motorbus carriers operating in the intercity and the city fields. In fact, the U.S. bus industry faced a major crisis as early as 1940. Aid to Great Britain and rearmament were rapidly bringing the industry face to face with critical shortages of essential bus maintenance materials and repair parts. To most people business as usual was still the order of the day, but not so the bus industry. Following the attack on Pearl Harbor the demands for transportation in both these fields imposed a burden that was almost insuperable. The whole war effort centred about the problem of transportation by the intercity bus, the city bus, the private automobile, the railroad and the aeroplane, with

216 the truck lines playing an ever increasing part in the transportation of goods and the materials of war. At the same

Table II.—U.S. Intercity Bus Operations

Year	No. Buses Owned	Operating Revenue (millions)	Revenue Passenger (millions)	Total Bus Miles (millions)	Estimated Revenue Passenger Miles (billions)
1936	24,750	\$275.0	500.0	1,250.0	8.7
1937	24,750	190.1	390.0	1,026.0	9.5
1938	20,000	177.4	373.7	990.9	9.6
1939	18,614	167.9	313.4	853.8	9.5
1940	18,000	174.2	361.4	893.6	10.1

1944	28,000	563.8	1,083.9	1,523.5	33.3
1945	31,250	576.0	1,092.0	1,560.0	36.2

time, the manpower needs of industry engaged in the war effort and the requirements of the armed forces began to drain off manpower and materials needed to keep the buses and the trucks rolling. Despite the handicaps under which the trucks and the city and the intercity buses operated, with the number of trucks and buses practically frozen so that there were little or no replacements, both of these services carried on with a great degree of efficiency. Thus, on the basis of reports made to the Interstate Commerce Commission by Class I for-hire truck carriers, traffic during the latter part of the war period was 19% above the 1941 level, but increases in efficiency made it possible to require only 90% of the mileage operated in 1941 to perform the service. In the intercity bus field, the record rose from 617,000,000 revenue passengers in 1942 to 1,092,000,000 in 1945 and in local bus service from 6,500,600,000 passengers in 1942 to 8,650,000,000 in 1945. In the same period, the number of buses in each class of service increased from 22,710 to 31,240 and from 44,101 to 50,625 respectively. Civilian motor truck production declined from 770,617 in 1936 to only 2,888 in 1943 and 119,031 in 1944.

Both the truck and the bus industries fought unremittingly to see that they received the recognition from governmental agencies to which they were entitled—material and supplies concomitant with the essential services that they were performing as factors in the domestic economy by transporting the civilian population, handling the war workers, supplying service to the various camps and at points of embarkation and in trucking materials and supplies essential to furthering the war effort. That was not easy, even with the associations representing the carriers, their trade papers and the Office of Defense Transportation battling for them. The army had great need for many of the automotive parts essential to the domestic carriers, and ODT, the claiming agent for materials needed by the carriers, had to prove its case with the Petroleum Administration for War and other agencies set up to further the war effort.

Table III.—New U.S. Buses Put Into Service

*Exclusive of trailer-type buses.

The functions and duties of the Division of Motor Transport and the Division of Local Transport, the first established in Dec. 1941, and the latter in Jan. 1942, and

both consolidated on June 1, 1944, into the Highway Transport department of ODT, were to advise and assist federal departments and agencies, state and local governments and private organizations in surveying the need for and planning transportation service to move personnel to and from war plants and establishments. Where necessary, the two divisions initiated and developed surveys and plans for transportation in each area, including those related to the production and the war effort, agricultural as well as industrial, to military and naval establishments, and to essential civilian services. At the time of the consolidation of the former Division of Motor Transport and Division of Local Transport, the combined personnel of the two divisions numbered 3,897, with 177 in Washington, D.C. and 3,719 in the field under a setup that divided the country into nine regions with regional and district offices.

U.S. Truck Industry.—Developments in the U.S. truck industry over the decade 1937-46 generally followed the pattern in intercity bus operation. In the first half of that period the tendency, as in the bus industry, was toward consolidation with the result that the industry was prepared at any time to go anywhere in the country with any loads. As the United States turned toward war production, the tonnage handled by the trucks increased; after the country entered the war, tonnage increased by leaps and bounds. Following Pearl Harbor, the truck lines found themselves beset by problems similar to those of the buses. There were shortages of manpower and materials. Here again, as in the bus industry, the government stepped in through the Office of Defense Transportation and set a pattern for the truck lines which was intended to have them contribute most to the war effort without dislocating their contribution to the general domestic economy. This was a tremendous problem. In the more or less normal period 1936-40, the average demand for new trucks

Table IV.—U.S. Truck Registrations by Year

Year	Number
1936	3,987,339
1937	4,255,296
1938	4,224,031
1939	4,413,692
1940	4,590,386
1941	4,676,054
1942	4,608,086
1943	4,480,176
1944	4,513,340
1945	4,650,000

was approximately 550,000 a year. Had this demand continued during the war period, approximately 2,567,000 new trucks would have been required from the time of the freeze of new commercial motor vehicles on Jan. 1, 1942, through Sept. 22, 1945, the time of the end of rationing. During that period, however, only 524,637 trucks were released to civilians. In other words, truckers actually received the equivalent of only 25.4% of their normal needs. The expected life of the truck varies widely. Thus, during the time that rationing of equipment was in effect, only 12.1% of the normal needs of light equipment were met, 34% of the medium and 87.2% of the heavy, or the equipment most essential to handle war materials. In general, mileage demands of trucks generally increase with the size of the equipment. This results in a service life much shorter in years for the heavy equipment than for light equipment. Account must also be taken of the fact that, prior to World War II, style obsolescence rather than ability to keep equipment in operation was largely a governing factor for truck operation in retail and wholesale distribution and other fields. Full account was taken of this factor by the ODT in the allocation of vehicles. In consequence, the principal recipients of equipment were in the heavy truck group,

namely, carriers engaged in petroleum distribution, in mining, logging, printed matter, wholesale food, manufacturing and lumber delivery, in all of which the demands were heavy. Generally, the same groups were above average in the number of light and medium truck allocations. As for the extent of the industry, about 2,000 truck carriers with gross receipts in excess of \$100,000 a year had reported to the Interstate Commerce commission. There were, of course, great differences in the truck operating characteristics in different parts of the country. The average wage of employees in the trucking industry was \$2,395 for the year 1944 compared with an average for all private industry of \$2,189. In the same year, 45% to 50% of all motor carrier revenue was paid out in wages. According to the American Trucking association, the average intercity truck operated 139 mi. per trip, paid \$1,403 in taxes a year, ran 43,925 mi. per year, got 4.8 mi. per gallon of gasoline and 82.9 mi. per quart of oil, earned gross revenue of 32.2 cents per vehicle mile and 3.8 cents per ton mile; took in gross revenue of \$15,099 a year, carried 2,230 tons of freight a year, hauled 393,261 ton miles of freight a year and carried 8.39 tons per load. For every power unit in operation the Class I carriers averaged 3.21 employees. The average revenue per carrier was \$515,682 a year. On a national basis, the Class I carriers leased 21.2% of the equipment they operated, but conditions differed widely in various parts of the country, ranging from a low of 2.9% in New England to a high of 35% in Illinois, Indiana, Ohio and the lower peninsula of Michigan. Intercity carriers used more tractor trailer combination units than they did ordinary straight trucks, the ratio being 143 tractors for every 100 straight units. On the other hand, local carriers operated only 41 tractors for every 100 straight trucks. For every 100 tractors operated by the intercity carriers there were 123 trailers or semitrailers, while local operators had 175 trailers or semitrailers for every 100 tractors. Farmers used more than 1,630,000 trucks and these, together with those operated by truckers, delivered half of all livestock and farm produce shipped to market. Railroads were operating almost exactly ten times the number of trucks in intercity service that they did in 1930.

Prior to the enactment of the Federal Motor Carrier act in 1935, which placed both trucks and buses under jurisdiction of the Interstate Commerce commission, each truck carrier had its own rates, which could be changed at will. Consequently there was much destructive competition. The railroads, among others, had urged that the motor carriers be placed under federal regulation, but the over-the-road carrier also favoured this move as a means of stabilizing the industry and bringing an end to destructive competitive practices. As a result of their being brought under regulation, the motor truck carriers were required to publish tariffs clearly stating their rates and charges, the tariffs to be open at all times to public inspection.

The increase in operating expenses which confronted the carriers during the period that they were subject to the jurisdiction of ODT was offset to some extent by a rate increase granted during World War II. In the property field, interstate property motor carriers were allowed to follow the general increase of 6% granted to rail carriers early in 1942. Motor carriers of property east of the Mississippi generally were granted a further increase of 4% through various decisions in the latter part of 1943 and early in 1944. These emergency charges were to expire at the end of 1945. As for the interstate carriers of passengers, they were allowed a 10% increase in rates early in 1942 following the approval of a similar increase in rail coach fares. The increase was generally applied by the passenger

carriers, but in the case of the truckers their ability to take advantage of the increase depended upon their competitive location compared with the railroads and even with other motor carriers.

The truck carriers were confronted in 1946 with a desperate need for more revenue. Early in that year, the truckers in the Central region, New England region and the middle Atlantic region filed applications for increases to make their rates roughly 25% higher than the rail rates. It was said then that the carriers in the southern region were preparing to take similar action. The I.C.C. allowed these increases to become effective, with hearings to be held later to determine their reasonableness. So far as the interstate bus lines were concerned, it was indicated in the summer of 1946 that the Interstate Commerce commission proposed to conduct an inquiry into their rates at hearings during the fall. Meanwhile the way was being cleared for a comprehensive study of the entire transportation situation by a congressional committee.

U.S. Sightseeing and Limousine Services.—As indicated previously, orders of the Office of Defense Transportation, notably general order No. 10, effective Sept. 10, 1942, put an end to sightseeing and other similar services, such as the chartering of buses. Even if no order of this kind had been issued, the bus carriers would have abandoned these services of their own volition. The exigencies of the situation would have dictated it. In the first place, the war demands made it necessary that every available vehicle be diverted to essential service. In the second place, the companies, beset by lack of manpower, vehicles and parts, were in no position to do anything more than try to cope with business being normally offered, business that had increased many times. With the end of World War II and the prospect that vehicles were likely soon to be available in increasing numbers, the management of companies which had run sightseeing and charter services made plans to return to supplying these well-paying types of service. Toward the end of 1946, although vehicles were still in short supply for city and intercity services, the carriers were reviving "blind excursions," on which the bus driver started out with orders he did not open until well on his way. In the north, buses were running again in the winter to ice carnivals and other outdoor winter sports events; chartered buses were again in operation. Thus, in the summer of 1946, the Associated Gray Line companies throughout the North American continent were back in full operation. The extent of this operation was evident in the fact that there were a number of companies in 65 cities which operated more than 250 sightseeing tours.

The U.S. School Bus.—Under the dire necessity of operating buses under wartime shortages of men, materials and vehicles, the primary objects of comfort for the transported pupil and safety and economy in operation of the vehicle were maintained. Nation-wide statistics revealed the extent to which this essential service was preserved. Successful operation of these vehicles was brought about by an almost complete revaluation of operating practices, maintenance, housing and even of specifications, to say nothing about a reappraisal of the training of the drivers and mechanics. Men were trained for replacements, new central districts were formed and other buses were redistributed. Consolidation and other expedients were disclosed by constant surveys of wartime school bus needs.

School bus officials were confronted by the fact that new buses, station wagons and sedans were frozen in the possession of dealers and manufacturers. To help the school bus

officials, a handbook, *School Transportation in Wartime* was issued as the outgrowth of work conferences at New Haven, Conn., and at Washington, D.C., prepared for and approved by the National Council of Chief State School Officers. Out of their conferences, in which representatives of the automotive industry and the American Automobile association participated, came a general nation-wide policy, together with a unified maintenance program including driver training. The suggestions made were not intended to be rigid, and school officers were free to modify them in the light of their experience under wartime operation.

As for the postwar school bus, it appeared likely that it would be constructed of lighter and stronger metals, that it would be equipped with larger engines with maximum torque at considerably lower revolutions per minute, that engine speeds would be governed instead of relying on road speed, and that adjustments would be made to compensate for higher octane rated gas. It was also expected that controls such as brakes, stoplights and directional signals would keep pace with highway improvements and expansion. It appeared unlikely that over-all width, seat and aisle width and seating capacity would change, but, as indicated previously, gross vehicle weight in comparison with pupil capacity was likely to be reduced.

Other Postwar Plans.—Despite the fact that the city and the intercity motorbus carriers were beset by a thousand and one problems during the wartime years, the managements were alert in planning for the future. Both types of carrier moved rapidly toward putting into effect plans for improvements and expansion of their services. It was planned, for instance, to spend about \$40,000,000 to modernize bus and streetcar equipment in New York city, about \$25,000,000 for similar improvements to the surface transportation system in Chicago, Ill., \$22,000,000 in Detroit, Mich., \$10,000,000 in Boston, Mass., \$5,000,000 in Los Angeles, Calif., and more than \$20,000,000 in San Francisco, Calif. There was a great amount of deferred maintenance, and a need to replace and augment a vast amount of rolling stock that had long been used beyond its life expectancy. Amounts proportionate to those of the larger cities were appropriated in the smaller cities and communities. In the intercity field, the National Association of Motor Bus Operators estimated that \$42,000,000 would be spent to construct and remodel terminals and garages, and that 6,000 buses would be purchased for intercity service at an estimated cost of \$90,000,000, with another \$10,000,000 earmarked to rehabilitate equipment. Greyhound alone announced that it would spend \$35,000,000 in the initial stages of a vast postwar program to provide better equipment and terminal facilities for its subsidiaries.

Particularly in the intercity field, the new vehicles were being designed to secure added comfort for the passenger. Thus, air-conditioned trolley buses were introduced in Atlanta, Ga., and air-conditioned motorbuses were placed in service in San Antonio, Texas. Both the intercity and the city carriers were alert to the possibilities of the helicopter with the result that about 100 companies in both fields, in the United States and Canada, filed applications for the operation of helicopters or other craft in connection with the operation of their surface vehicles. Still another development was the use of two-way radio by the bus lines as a means of providing contact between the vehicle on the road and the dispatcher to clear traffic congestion and aid in emergencies such as vehicle failures on the road and accident.

By presidential order, U.S. soldiers took over trucking operations when Chicago teamsters went on strike May 16, 1945, in a dispute over wages and hours. Army personnel functioned as drivers and escorts

It seemed probable at the end of the decade 1937-46 that the road bus would meet its greatest competition in the private automobile. It appeared, therefore, that two distinct types of vehicles might be developed to meet the travel requirements in every section of the country—a smaller vehicle to handle the business of the feeder lines and the short runs between cities, and the “leviathan” of the road, similar to the two-level, tractor-trailer design of the Santa Fe Trail Transportation company, with seats for 117 passengers. Designers realized the necessity of providing equipment equal, in advance engineering, to the highways that would be provided for its operation. The Santa Fe vehicle could be taken as a precursor of things to come in the over-the-road vehicle.

The design of vehicles undoubtedly would take into greater account the need for simplification of the power plant; with the emphasis on accessibility of all parts for easy repair and the interchangeability of the power and other units.

Great Britain and Other Countries.—Between the two world wars Great Britain's motor transport industry, following a lengthy inquiry by a royal commission in 1930, worked under progressively increasing government control. The Road Traffic act of 1930 enforced certain safety measures in connection with passenger vehicles; provided the machinery for regulating passenger services, and made compulsory third-party insurance for owners of all mechanically propelled vehicles. The Road and Rail Traffic act 1933 imposed a licensing system for good vehicles (under the jurisdiction of the traffic commissioners appointed earlier to deal with passenger licences) whereby the holding of a public carrier's licence was subject to fair wages and conditions of employment for drivers, and observance of regulations in regard to speed, drivers' hours, safe loading and proper maintenance of vehicles. The Road Haulage Wages act 1938, provided a wages board for the statutory regulation of wages and conditions of operatives employed by “A” and “B” licence holders.

Passenger transport undertakings developed quite independently, the licensing control being completely different.

The system of licensing favoured consolidation both of private and municipal undertakings and, furthermore, the railways took a large share interest in many of the larger nonmunicipal undertakings.

Table V.—Motor Vehicle Licences in Great Britain

	Private Cars	Motor Cycles	Hackney Carriages (Buses, Coaches & Taxis)	Goods Vehicles
1937	1,798,105	487,578	85,766	478,922
1938	1,944,394	462,375	87,730	494,866
1939	2,034,400	418,000	90,000	488,000
1940	1,423,200	278,300	81,300	443,900
1941	1,502,600	317,000	85,100	450,200
1942	857,700	305,900	85,100	453,000
1943	717,500	123,700	86,700	449,400
1944	755,400	123,900	90,400	447,800
1945	1,486,600	309,100	98,700	473,100

A number of restrictive regulations were withdrawn during World War II such as the limitation of standing passengers in buses. Rubber and fuel shortages caused cancellation of all but essential services, and black-outs, wooden seats, and the like, made travelling far from comfortable. Many buses were commandeered for service needs, and during "blitz" periods it was customary to see buses hundreds of miles from their base.

After the cessation of hostilities buses were in short supply everywhere, many of the larger undertakings having placed orders running into millions of pounds, with delivery promised in a year or two. There were, therefore, inescapable queues, very rough vehicles and a slow but general appreciation that the morning and evening peak loads could only be met by the staggering of hours. Fuel supply was still somewhat limited although permits were granted for a resumption of coach tours as distinct from ordinary buses, and occasional long-distance services were reopened. War conditions had caused well over 1,000,000 private cars to be laid up, most of which, however, were back on the road, with restricted fuel allowances in 1946. Great Britain was second to the U.S. in the number of cars and it has been estimated that under more normal conditions the number might reach 4,000,000–5,000,000 within ten years.

Consequent upon World War II, the economic situation, short supplies and transport difficulties, fuel rationing was still in force at the end of 1946 and the wartime procedure functioned for all classes of vehicles. Buses automatically obtained permission from the traffic commissioners for all journeys undertaken. Goods vehicles were controlled by an emergency road transport organization, introduced shortly before the war and largely voluntarily staffed by the operators of commercial vehicles, such persons being cognizant of the traffic requirements of Great Britain. Twelve regions, similar to the civil defense regions, were formed, and these then were broken down into districts and subdistricts. All operators were requested to form themselves voluntarily into groups, where possible engaged on similar work. Vehicles on nonpriority work were allowed a bare minimum or entirely refused supplies. The scheme was successful and terminated only at the end of the war; thereafter allocations were made to individual operators by traffic officers of the ministry of transport working on a subdistrict level.

Before World War II goods vehicles numbered about 500,000; 70% were operated by traders and restricted to the carriage of their own goods under a "C" licence while the remaining 30%, owned by about 60,000 operators, formed the fleet public goods vehicles of which 95,000 were under "A" and 50,000 under "B" licences. Competition between rail and road was so acute that the British railways, just before World War II launched a "square deal" campaign. This was an attempt to secure greater freedom for rail, or, alternatively, more restriction on

road traffic. As a result, discussions between rail and road interests were inaugurated through the transport advisory council (set up to advise the minister of transport on all transport matters), a road-rail conference emerged and some progress was made toward finding a mutually satisfactory solution to the problem. Wartime conditions, however, slowed down the work of this body. Good progress was made after the defeat of Germany; relations with the railroads became more friendly, and apart from such interim measures as joint licensing committees, set up for the purpose of minimizing objections in the traffic courts, a road-rail plan for the complete co-ordination of inland transport was evolved in July 1946 and approved, not only by all carrying interests, but also by the traders. In 1945, however, the government introduced its Transport bill to nationalize all forms of transport. This provoked considerable opposition from transport owners and producers, and the fate of the voluntary plan for co-ordination became doubtful.

During World War II all goods transport was greatly restricted by fuel rationing and defense permits were substituted for licences. All classes of operators notwithstanding previous licence restrictions were allowed to carry essential goods.

In 1941 the minister of war transport, in collaboration with the road transport (goods) industry, introduced a voluntary scheme for the control of essential movements by road. Before this scheme was fully working Japan's attack worsened the rubber and fuel situation, and road transport had to be severely curtailed. Long distance work, *i.e.*, road haulage between points more than 60 or 70 miles apart, became even more difficult. Yet, road haulage proved invaluable in clearing ports during the worst blitz conditions. The minister of war transport set up a road haulage organization, with which long distance road operators registered their vehicles. Certain of the larger operators became controlled undertakings, *i.e.*, the ministry of war transport hired their physical assets guaranteeing an agreed profit; the rest, working under the direction of controlled undertakings, were engaged on a period hire basis. At the same time, under defense regulations, the movement of goods by road in excess of 60 road miles was prohibited, unless conveyed by the road haulage organization or under a permit issued by regional transport commissioners. Under this arrangement, the minister could lay up vehicles while assured of full operational strength.

In the late 1930s a number of European countries constructed strategic roads. Thus, Germany's attacks on Austria, Czechoslovakia, Poland, France, the Low Countries, and later Russia, were greatly facilitated by its *autobahnen*. A number of principal railways in Europe were subject to state control which sometimes included certain sections of road transport. Always, development of road transport was retarded to protect the more established forms of transport, whether under private or under state ownership. In 1946, incomplete wartime statistics did not allow for a detailed survey of commonwealth development but the same conflict between rail and road existed as elsewhere, and in nearly all cases road transport was progressively restricted in the vain hope of solving the problem (as in Austria, Belgium, Czechoslovakia, Denmark, France, Germany, the Netherlands, Hungary, Italy, Poland, Rumania, Sweden, Switzerland and Yugoslavia). In general, the difficulty continued of balancing the public interest with the interests of established undertakings, which, in some spheres had outlived their usefulness. In Great Britain,

the full co-ordination of inland transport envisaged in the road-rail memorandum of July 1946, indicated a logical method of approach to a world-wide problem. (See also ACCIDENTS; AUTOMOBILE INDUSTRY; DISASTERS; HORSES; INTERSTATE COMMERCE COMMISSION; MUNITIONS OF WAR; RAILROADS.) (L. GL.)

Motta, Giuseppe

Motta (1871–1940), Swiss statesman and scholar, was born in Airolo, Switzerland, Dec. 29, 1871. He was educated at the universities of Freiburg, Munich and Heidelberg. Elected to the national council in 1899, he was chosen president of Switzerland in 1915 and was re-elected four times, the last time in 1937. He was also honorary president of the League of Nations. When he died at Berne, Jan. 23, 1940, he was serving as chief of the Swiss political department.

Mountbatten, Viscount Louis

Viscount Mountbatten (Louis Francis Albert Victor Nicholas) (1900–), British peer and naval officer, was born June 25, 1900, in Frogmore house, Windsor, England, as Louis Francis Albert Victor Nicholas of Battenberg. His mother, Princess Victoria, was a daughter of Grand Duke Louis IV of Hesse and a grand-daughter of Queen Victoria. His father, Austrian-born Prince Louis Francis of Battenberg, was grandson of Louis II of Hesse and a cousin of King George. In 1917, the father relinquished his position and titles and resigned as an admiral of the fleet because of anti-German sentiment and changed his name to Mountbatten, the English equivalent of Battenberg.

Young Mountbatten entered the royal navy at the age of 13 and served during World War I as a midshipman aboard two battleships. After the war, he was named per-

Viscount Louis Mountbatten shown with Generalissimo and Mme. Chiang Kai-shek on his arrival at Chungking in Nov. 1943, to head the southeast Asia command

sonal aide-de-camp to the prince of Wales, and accompanied the prince on his tours to the far east in 1920 and 1921. Continuing his service in the navy, he rose through the ranks to the grade of acting vice admiral in March 1942.

Early in World War II, he was given command of the destroyer "Kelly," which was twice damaged in war action at sea; Mountbatten succeeded in bringing the ship safely back to port each time. In 1940 Mountbatten took the patched-up "Kelly" to the Mediterranean; this time the craft was sunk by nazi divebombers in the Crete fighting in 1941. Mountbatten was picked up by another destroyer.

In April 1942, Mountbatten succeeded Sir Roger Keyes as chief of combined operations and supervised commando operations off the coast of Norway and France. During their consultations in Quebec in Aug. 1943, President Roosevelt and Prime Minister Churchill agreed on Mountbatten's selection as supreme commander of the newly created southeast Asia command, and the following month he was made acting admiral.

In 1944–45, Mountbatten directed Allied operations against the Japanese in Burma. After the close of the war, he accepted the surrender at Singapore on Sept. 12, 1945, of all Japan's southern armies. He continued in his command, and on May 26, 1946, it was disclosed that he was succeeded by Lt. Gen. Montague G. N. Stopford. He was created a viscount on June 12, 1946, and was appointed viceroy of India in 1947.

Mukden (Shenyang)

By 1937, Mukden (which the Chinese call Shenyang), largest city of Manchuria, with a population of 1,135,801 (Dec. 1940), had been under Japanese occupation for six years. The "Mukden incident" of Sept. 18, 1931, was generally regarded as the beginning of World War II.

The Japanese five-year development plan of Manchuria, initiated in 1936 and revised in 1938, aimed at making Manchuria the arsenal and the granary of the Japanese empire through exploitation of its rich natural resources and cheap labour. Mukden, the main railway junction and trading centre of Manchuria, became one of the most important industrial centres of the far east during the Japanese occupation.

It was estimated that 3,000 factories were located in Mukden, representing a very substantial portion of Japan's overseas investments.

On Aug. 20, 1945, the soviet army entered Mukden. After almost half a year of occupation, the soviet army was evacuated from the city. The troops of the Chinese government entered Mukden on March 12, 1946. Reports from all sources stated that the soviet troops had removed most of the industrial equipment in Mukden, regarding it as legitimate "war booty." Mukden did not suffer direct damage from the war. The removal of its industrial equipment, however, was a very severe blow to the livelihood of the people of the city.

During the period immediately following the war, Mukden also became the political centre of Manchuria, the city of Changchun (Hsinking) being for some time in the hands

Textile factory in Mukden, one of the Manchurian plants stripped of machinery by Red army troops before their evacuation in the spring of 1946

of the Chinese Communists. The chief political agency in Mukden was the northeastern headquarters of the generalissimo (Chiang Kai-shek), headed by General Hsiung Shih-Hui. The city also resumed its former position as the capital of Liaoning province. (C. CN.)

Municipal Government

The decade 1937-46 reflected three distinct phases in the history of municipal government in the United States: (1) emergence from the depression period of the early '30s from 1937-41; (2) the war period, 1941-46; and (3) planning for "reconversion," 1943-46. The imprint of these three phases of municipal history can be traced clearly in the general improvement of the fiscal and administrative affairs of the cities as they emerged from the depths of the economic depression; in the intensified relationship between the cities and the federal government during the war emergency; in the impact of the war on municipal finance and personnel; in the abandonment of capital improvements during the war period; in the postwar planning activities of the cities; in the war and postwar housing crises; and in various related developments.

Characteristic of the prewar period were the problems of relief and unemployment; the unresolved conflict in federal-state-local fiscal relations; the recurrent problem of insufficient municipal revenues; the inadequacy of

training programs for municipal personnel; and the need for long-range municipal and fiscal planning. World War II itself raised new problems in the fields of municipal finance and personnel; also problems of defense organization, of provision of emergency facilities in war-congested areas and of the need for postwar planning. It also brought the cities a financial prosperity such as they had not known for years, but which did not blind them to the greatly expanded fiscal demands which would be placed upon them to meet the growing community services they would be called upon to provide. The great problem of urban blight, with its disastrous effects on the economic status of metropolitan areas, emerged in this latter period as an inseparable phase of the entire housing problem.

An interesting aspect of the decade 1937-46 was the development of certain major concepts, some possibly for the first time. Paramount among these was the increased recognition of the role of the cities in the nation and in the world. The rise of the cities to a dominant position in U.S. life had been a phenomenon mainly of the 20th century. It was particularly emphasized in the depression period, when the concentration of population in the cities created a major relief problem which had to be handled on a national scale. This dominant position of the city in the national life was given its first official recognition by the report of the National Resources committee, *Our Cities—Their Role in the National Economy*—noted more fully below—which was published in 1937 and was followed in 1938 by the supplementary report of the Urbanism committee in the two volumes: *Urban Government* and *Urban Planning and Land Policies*. In the war period, the cities became the great production centres on which the outcome of ultimate victory or defeat largely depended. And in the peace, it was the cities which bent their energies to postwar development along the necessary physical, economic and social lines. The new alliance between governmental, economic and social factors was a definite development of the decade.

Another concept particularly notable during this period was the renewed interest in "home rule" and the revital-

ization of local government. This movement was indicated by efforts to awaken citizen interest in government, as by the organization of "Citizenship Days" with impressive ceremonies surrounding the induction of voters. It was manifested in local opposition to proposals for federal aid for urban redevelopment and for education, in local initiative in the development of new revenues and preparation of postwar plans and in the exemption of the cities from various federal wage stabilization and unemployment regulations applicable to industry during the war—all based on the desire of the local governments to maintain their relatively independent status. The activities of the Council on Intergovernmental Relations, described in a later section, were also motivated by the desire to strengthen the local level of government by segregating and decentralizing strictly local functions and by strengthening their performance on a co-ordinated basis.

A further evidence of this effort to establish and revitalize local institutions was apparent in the resurgence of interest in metropolitan problems and the effort to achieve broad metropolitan federations as a method of preserving local self-government, arresting urban blight and, possibly, regularizing urban and industrial decentralization primarily to meet the needs of peace, but also to serve as a better defense in case of atomic war. In spite of the continued spread of urban populations into suburban areas, the period was one of few territorial annexations to cities.

The recognition, on the other hand, of the need for a proper basis of relationship between the federal, state and local governments led to marked activity in the field of intergovernmental relations, particularly regarding fiscal matters.

The war emergency organization intensified these relationships and contributed to their development on the regional and intermunicipal planes.

One further development may be noted: the rapid growth in the number of employee organizations or unions and the increasing conflicts between such organizations and city governments. The marked progress of labour unions in the industrial field during the decade undoubtedly stimulated this condition.

Settlement of the legal issues involved and crystallization of policy had perforce to wait until the termination of the war.

Intergovernmental Relations.—The emergencies of the depression and war eras laid the basis for the deepening interrelationship between the municipalities and the state and national governments. While nothing like the degree of centralization of municipal functions in the national government which had taken place in Great Britain, for instance, had as yet occurred in the United States, there were increasing indications of the need for clarification, in the interests of local self-government, of the lines of relationship which had developed between the municipalities, the federal government and the states.

Direct federal-city relations were born of the relief needs of the depression period. Federal aid, in the form of Work Projects Administration and Public Works Administration grants, was for the first time extended directly to the cities, the great population centres, rather than channelled through the states as was the practice with public health, highway improvement and vocational education federal aids. This set a new pattern in federal-city relations, which was maintained in numerous ways in the war period, notably in the distribution of funds under

the Lanham act to war-congested areas for the construction of urgently needed additional community facilities. It became the basis for the distribution of federal funds for advance public works planning, authorized under the War Mobilization and Reconversion act of 1944, and might well be the basis for the distribution of federal funds for the actual construction of postwar public works, if and when such funds became available. The \$500,000,000 federal aid program of matching grants to state and local governments for construction of some 3,000 new airports and improvement of about 1,600 others in the next 7 years, beginning July 1, 1946, was finally placed on this same basis after a prolonged battle between the municipalities and the states, which desired the grants to be channelled exclusively through them. The act as passed permitted direct dealings with local government sponsors of projects except in states having statutes requiring channelling through state agencies.

During the 1940s, the growing problem of intergovernmental relations was accorded specific recognition by various public and private agencies. In 1943 the Special Committee on Intergovernmental Fiscal Relations appointed by Secretary of the Treasury Henry Morgenthau in 1941 issued its monumental study on *Federal, State and Local Fiscal Relations*. In 1944 Alvin H. Hansen and Harvey S. Perloff published their pioneering study, *State and Local Finance in the National Economy*, and the Commission on Governmental Efficiency and Economy of Baltimore published a study of state-local relations in Maryland. In 1944, 1945 and 1946, the Rhode Island Public Expenditure council issued a continuing series of studies on state-local relationships in that state. Massachusetts in 1945 published the comprehensive report of its Special Commission on Real Estate Taxation and Related Matters, dealing with state-local fiscal relations. Various other states, including New York, Florida, Michigan, Maryland, California and Oregon, undertook comprehensive studies of their state tax structures, with a view to revision of state-local fiscal relationships. In 1944 three major municipal groups—the American Municipal association, the Municipal Finance Officers association and the International City Managers association—all took official cognizance of the need for improved fiscal relations between the federal, state and local governments, and in 1945 a fourth group, the U.S. Conference of Mayors, stressed the importance of the new relationship which had developed between the cities and the federal government. The Council of State Governments established a committee on state-local relations to consider problems raised by the fiscal, functional, legal and other relationships between the localities and the states.

Another noteworthy development in 1945 was the formation of the Pacific Coast Board of Intergovernmental Co-operation, a purely advisory body composed of representatives of the cities of Washington, Oregon and California and of the county, state and federal governments, for the purpose of improving working relationships between the different levels of government concerned with the same groups of people. The board grew out of the Ninth Regional Civilian Defense board set up during the war to meet Pacific coast mutual defense problems.

Finally, mention should be made of the work of the Council on Intergovernmental Relations, founded at Washington in 1941. This group was composed of several federal officials, the executive directors of the American Municipal association, the Council of State Governments and the Institute of Public administration, under the chairmanship of Harold Smith, then budget director of

the United States. With the aid of a grant from the Spelman fund, it inaugurated local programs on a county basis for the purpose of formulating and testing a plan for better co-ordination of governmental services through increased co-operation between the local, state and federal government officers at work in a given county, thus improving and strengthening all government at the grass roots. Early in 1946 four council programs were under way: in Henry county, Ind.; Blue Earth county, Minn.; Colquitt county, Ga., and Santa Clara county, Calif. The council secured the necessary funds and initiated the local program, which was undertaken by local public officials together with interested citizens, assisted by state and federal committees. The local Blue Earth County Council on Intergovernmental Relations issued a progress report on its two-year study in 1945 and the Henry County council reported similarly in 1946. The purpose of these significant projects was to promote fundamental studies looking to the preservation of the vitality of local government and its protection against encroachment by the federal government or the state. In 1946 a comprehensive five-year study of intergovernmental relations in Minnesota was announced, to be undertaken by a group of political scientists of the University of Minnesota, Minneapolis, Minn., headed by Prof. William Anderson. This study was to emphasize such functions of government as public health, welfare, works, education, finance and labour relations, and was to be the most comprehensive of any heretofore attempted.

Impact of the War.—U.S. cities escaped the physical devastation which war brought to the bombed cities of Europe and Asia. The effects of the war were felt mainly in the difficulties experienced in procuring priorities on materials and supplies for the maintenance of municipal services; the loss of employees through the draft and to war industries; municipal salary and wage increases caused by the rapidly rising costs of living; the expansion of community facilities—schools, garbage collection, traffic signals and policing, recreation centres—in “boom” cities; and in some instances “defense depression” caused by curtailment of private industry of a nondefense character, although the defense spending program on the whole had an enormously stimulating effect on the economic life of local communities.

One of the phenomena of the war period was the internal migration of population from the farms—as well as from nonfarm areas—to the war industry centres, chiefly from the rural west, the agricultural south and the north-eastern states to the cities of the Great Lakes, the Gulf coast and southern Atlantic seaboard and the Pacific coast areas. Shipyards and military establishments in some instances brought influxes of population far exceeding the entire prewar population—as at Pascagoula, Miss.; Vallejo, Calif.; Ypsilanti, Mich., where a population of 12,000 had to provide for the 30,000 workers of the Ford bomber plant at Willow Run; and Charlestown, Ind., where a village of 800 increased by 300% in less than 2 years. Metropolitan centres likewise experienced rapid expansion. San Diego, Calif., and Washington, D.C., increased 35% in population from April 1940 to May 1942; and similar increases occurred in the Norfolk, Va., region, Mobile, Ala., Montgomery, Ala., Charleston, S.C., Jacksonville, Fla., Corpus Christi, Tex. and Wichita, Kan. The Detroit, Mich., Chicago, Ill., and Los Angeles, Calif., areas increased by more than 100,000 population each over this period. Dayton, O., and Galveston, Tex., Louisville, Ky., Columbus, Ga., San Antonio, Tex., Johnstown, Pa., and Columbus, S.C., also had large population increases. As

these increases occurred in regions which had been undergoing considerable industrial expansion over the prior two decades, it appeared likely that—barring a postwar depression—these centres would hold a large proportion of their population gains after the war. This situation raised potential problems for the cities of race relations, education, housing, health, sewers and water supply and the future incidence of unemployment relief.

The more immediate problems of critical shortages of housing, schools, transportation, health, recreation and other community facilities were met by the aid of federal funds, beginning with an appropriation of \$150,000,000 in June 1941 under the Lanham act for the construction and equipment of additional municipal public works. It subsequently became necessary to establish a federal Committee for Congested Production Areas (1943) in the executive office of the president to co-ordinate federal activities regarding problems arising out of congestion and to supplement the efforts of the state and local governments in meeting the social and economic problems involved. The committee aided in the handling of priorities, authorizations of plant expansion, of manpower shortages, the hotel situation and child care program development, as well as the provision of additional community facilities, until its abolition at the close of 1944.

Civilian Defense.—Local civilian defense councils were organized in 1941 under the direction of the federal Office of Civilian Defense, of which Mayor Fiorello La Guardia of New York city was the first director. Local defense councils increased from about 1,500 in May 1941 to about 6,000 at the close of the year. Volunteer enlistments increased from less than 1,000,000 in Nov. to an estimated 5,000,000 following the attack on Pearl Harbor. Blackouts and practice air raid drills became customary, particularly in the coastal cities. New York city established a board of disaster control, consisting of representatives of various city agencies dealing with the protection of life, health and property, which worked out comprehensive safety plans; similar agencies were set up in a number of other communities. Mutual aid plans for the extension of water, police, fire and other services between neighbouring municipalities were established in several states. The tire rationing system, under the Office of Price Administration, was operated locally by tire rationing boards designated by local officials in co-operation with the local defense councils. War risk insurance was taken out by many cities through the federally created War Insurance corporation.

As the danger of air raids declined, communities adjusted their civilian defense programs so as to maintain protective services for such emergencies as fires, explosions, floods, major industrial accidents and similar disasters, and to aid in community war services. An outstanding example of the use of the civilian defense organization for disaster relief occurred in the Port Chicago incident in California in 1945, when the explosion of two ammunition ships at a near-by pier caused hundreds of casualties and enormous property loss to an entire community. When the war ended, many of the volunteer groups which sprang up in the war period tended to become permanent municipal institutions. Philadelphia, Pa., instituted a post-war auxiliary police force of 500 men, practically all with experience in the civilian defense organization during the war, to serve in times of emergency or during the staging of special events. Columbus, O., similarly recruited a volunteer police force of 200 members. Civilian defense workers in Tacoma, Wash., reorganized to help in the

United Nations Relief and Rehabilitation administration clothing drive and other postwar activities. Volunteer service bureaus were rendering assistance in various public welfare fields, including veterans' problems, in Seattle, Wash., Denver, Colo., and St. Louis, Mo. In other cities, former defense organizations were turned into permanent disaster agencies. Disaster councils were established in several California cities, and in 1946 the elaborate wartime defense setup in the San Francisco bay area was being reorganized into a disaster corps equipped to deal with earthquake, fire and other emergencies, forming a permanent part of the San Francisco government under an executive officer appointed by the mayor. (See also AIR RAID DEFENSE.)

Employees and Pay Rolls.—Comparable data on the number of nonschool city employees and amount of pay rolls for the years 1940 through 1945 showed that while the number of municipal employees naturally declined during the war years, because of losses to the armed services and to war industries, pay rolls consistently mounted as city after city was obliged to increase its wage and salary rates to meet the competition of industrial workers and to offset the rising cost of living (Table I).

Table I.—U.S. City Employment as of October in Selected Years*

Year	Number of Employees (in thousands)	Amount of Pay rolls (in millions)
1940	887	\$104.9
1941	901	108.4
1942	872	109.7
1943	858	119.3
1944	855	125.0
1945	875	133.0

*Census Bureau: Government Employment, vol. 5, no. 10, July 1946: "City Employment in 1944." Figures could not be carried further back because of revision of its classification by the census bureau in 1944; the earlier figures were adjusted to fit the new classification.

On an index basis of the two-year average 1940-41=100, total city nonschool employment and pay rolls from Oct. 1941 to Oct. 1945 were as follows:

	1941	1942	1943	1944	1945
Number of employees	100	97	95	95	97
Amount of pay roll	101	102	111	116	124

Wage increases were granted on an increasing scale in 1946, while the number of municipal personnel steadily increased.

A significant shift occurred in 1945-46 in the ratio among federal, state and local employees. Federal civil employees decreased by 753,000 persons, whereas state and local government employees increased 314,000 persons following a period of relative stability. This increase reflected a return to prewar status. Total public employment decreased 6.5% over this period; state and local government employees, however, rose from 46% to 55% of the total public employment.

Information on the number of school employees was tabulated by the census bureau for the first time in 1946. The number of nonschool state and local government employees—of which city employees comprise nearly half—as of April 1946 was 2,064,000 (preliminary estimate) compared with 1,881,000 for April 1945. The corresponding figures for school employees were 1,390,000 in 1946 compared with 1,260,000 in 1945. Pay rolls for nonschool employees—of which cities comprised about half—increased from \$253,800,000 in April 1945 to \$294,200,000 (preliminary estimate) in April 1946; and for school employees from \$198,600,000 in 1945 to \$229,800,000 in 1946.

Personnel Training.—In-service training programs by state and local governments helped train some 200,000

public employees in 37 states during the war period. In 1946 these programs were being adapted to peacetime purposes. Most of the in-service training of municipal employees was done under the supervision of state boards for vocational education with the assistance of federal funds authorized under the George-Deen act of 1936. The Municipal Training institute of New York state, for instance, trained many thousands of municipal employees annually with the aid of federal grants under this act.

State leagues of municipalities also initiated training programs, most of which, however, were taken over by the state vocational training program under the George-Deen act. Table II shows the extent of public service training from 1937-38 to 1944-45, when an administrative federal ruling temporarily curtailed the use of funds.

Table II.—U.S. Public Service Training, 1937-45

Year	Number of Trainees
1937-38	None
1938-39	50,723
1939-40	62,303
1940-41	81,784
1941-42	88,707
1942-43	81,264
1943-44	75,575
1944-45	67,663

It will be noted that the peak enrolment was in 1941-42. Enrolments decreased during the war years, when municipal personnel were called into the armed services and war industry, at which time also practically all trade and industrial funds were directed exclusively into training war workers. Firemen and policemen constituted the greater part of the trainees throughout the above period; more than half throughout the nine years were firemen. In 1944-45, trainees included, in addition to firemen and police, school custodians and janitors, school bus drivers, public welfare employees, water and sewage plant operators, municipal administrators and officials, public health employees and hospital attendants, correctional institution officers, conservation officials, finance officers and assessors, power plant operators and inspectors. In July 1945 an administrative ruling prevented the use of George-Deen funds for training other than of a trade or industrial character, which virtually halted all federally aided public service training except for police and firemen. In 1946 federal aid to state and local programs was increased from \$14,000,000 to approximately \$29,000,000 annually.

Many of the larger cities had local programs for the in-service training of their employees. The work of the Bureau of Training of the Civil Service commission in New York city, begun in 1939, and the training program in San Diego county, Calif., were particularly outstanding. An increasing number of colleges and universities were providing training opportunities for municipal employees. While many of these were confined to short courses or institutes, mostly for police and firemen, a few, such as Wayne university, Detroit, Mich., the University of Southern California, Los Angeles, Calif., and New York university, N.Y., offered more varied programs. Two other outstanding organizations in the in-service training field were the Pennsylvania Public Service institute and the North Carolina Institute of Government, at the Universities of Pennsylvania, Philadelphia, Pa., and North Carolina, Chapel Hill, N.C., respectively. The former, financed on a 50-50 matching basis by state and federal funds, trained both state and local employees and had graduated nearly 50,000 employees since its creation in 1938. The North Carolina institute, organized in 1932, specialized in the preparation and distribution of manuals and guidebooks for use by local officials.

In-service training courses in their respective fields were also organized or sponsored by various professional associations, such as the International City Managers association, the Municipal Finance Officers association, the National Association of Assessing Officers, the National Association of Housing Officials, the American Society of Planning Officials and the International Association of Chiefs of Police. A greater amount and variety of training was made available for police and firemen than for any other class of municipal employee.

Under the educational and vocational training provisions of the G.I. Bill of Rights, as amended in 1945, which made federal subsidies available to veterans training on the job as well as those training in schools and colleges, it became possible for a municipality to qualify as a "training institution" and in that way secure assistance in the training of its new personnel. Municipal training programs, including conditions of employment and related instruction, were subject to approval by the Veterans administration. Several cities, notably San Diego, Calif., and Flint, Mich., had begun such training programs by 1946. Because of reported abuses of job training programs in industry throughout the country, congress acted in Aug. 1946 to establish monthly pay ceilings and tighten the standards for all job training projects.

It was thus apparent that a great deal of municipal training activity was in progress in the decade 1937-46. Much of it, however, was scattered and spasmodic and, except for a few states and large cities, on a wholly inadequate scale with regard to the proportion of employees reached. The full possibilities of this phase of municipal enterprise had yet to be realized.

Growth of Municipal Employee Unions.—At the beginning of 1946, employee organizations or unions had been formed in 618 or nearly 60% of the cities of the United States of more than 10,000 population; whereas at the close of 1937 they existed in only 319 or about 33% of such cities. In 1946 there were employee organizations in all 14 of the cities of more than 500,000 population but in only about 40% of those from 10,000 to 25,000 in population. In 1937 they had existed in all 13 of the cities in the more than 500,000 population group but in only about 20% of those from 10,000 to 25,000. In 1946 just over half of the cities of more than 25,000—contrasted with less than 10% of such cities in 1937—had more than 1 local chapter of a national affiliated organization, such as the American Federation of State, County and Municipal Employees (American Federation of Labor), the International Association of Firefighters (A.F. of L.), and the State, County and Municipal Workers of America (Congress of Industrial Organizations). The A.F.S.C.M.E. (A.F. of L.), for example, had 8 locals in Los Angeles, drawn from various city departments; while the S.C.M.W.A. (C.I.O.) had 12 locals in Detroit and 7 in New York. Nonaffiliated groups were operating in 143 cities in 1946, contrasted with 14 cities in 1937. These data are exclusive of skilled municipal workers belonging to their own craft unions and the host of "professional," benevolent, protective and social organizations organized along functional lines, as in police departments or among the nurses. While the tendency was to discourage and even prohibit the formation of police unions, as contrary to public policy, police employee locals were reported as existing in 49 cities as of 1946, 18 having been organized in 1945. These were chapters of the A.F. of L. national organization only, as the C.I.O. had no purely police locals.

The entire field of municipal labour law was thoroughly explored in a major publication, *Labor Unions and Muni-*

cipal Employee Law, by Charles S. Rhyne, published in 1946 by the National Institute of Municipal Law Offices in Washington, D.C. A brief but valuable report of the National Civil Service league, entitled *Employee Organizations in the Public Service*, released originally in Feb. 1946, did much to clarify the atmosphere during the threatened strike of New York city subway employees which was finally averted only through the intervention of C.I.O. President Philip Murray at Mayor William O'Dwyer's request. The right of New York city's transit employees to strike was subsequently rejected as against public policy by the mayor's Advisory Transit committee.

Finances.—The decade was characterized by marked retrenchment in city finances, caused first by the depression and later by the war crises. While it was not possible to present specific consecutive data for all phases of municipal finance, because of changes in coverage and reporting practices of the census bureau's series of financial statistics for cities, the general trends could be clearly traced.

Revenues and expenditures, which had fallen off in the early 1930s, had resumed their upward trend by 1937, but both declined in the aggregate during the war years. Curtailments in outlays for capital improvements, highways and public welfare forced expenditures down; reduced revenues from special assessments because of the curtailed capital improvement program, cessation of the PWA program of federal aid to cities and the lessening of state aid for relief, were the main factors in reducing revenues. Wide variations within individual cities prevailed of course. Expenditures of war industry cities were increased to provide emergency community facilities such as schools, hospitals, utilities, recreation centres and other public needs; while expenditures for police, fire and other protective services increased generally. In 1944 total general revenues were slightly higher than in 1943, but total expenditures were virtually the same.

In 1946, the cities generally found themselves in the best financial condition they had known in many years. In New York state, for instance, it was reported that debts had been sharply reduced from their peak of 1940 back to the 1925 level; the unsound practice of refunding had been everywhere abandoned; tax collections had reached new levels and tax anticipation loans were almost eliminated; the decline in assessed valuations, begun in 1932, had ended; real estate prices were moving sharply upward; about half the municipalities had money on hand to finance postwar improvements. Finally, the uncertainties and inequities of state aid had been eliminated through the new plan of state assistance and related legislation. The gains noted in New York state were representative of the generally improved financial status of cities throughout the country.

This otherwise favourable picture was marred by the realization that the cities were facing greatly increased outlays for expansion of community services in a period of rapidly rising costs of both labour and materials without correspondingly increasing revenues to draw on. The property tax, always the backbone of municipal finances, had reached its maximum return in many cities and was on the decline as a source of revenue. By 1945 and 1946, interest accordingly had centred on the search for new sources. These were found principally in local nonproperty taxes, new or increased service charges and larger shares in state-collected taxes and state and federal grants-in-aid. The utility of local nonproperty taxes was first demonstrated by New York city to meet a financial crisis

in 1934, when it imposed five new local taxes under a temporary grant of authority from the state. Three of these—the sales, gross receipts business and utilities tax—still remained at the end of the decade. In 1938 New York city pioneered again in imposing a municipal cigarette tax, and in 1946 it imposed a pari mutuel tax and a tax on hotel room occupancy. Philadelphia imposed an admissions tax on amusements in 1938 and the first real municipal income or “pay roll” tax in 1939. These examples were followed by other cities, which in turn levied new types of local taxes. The success of the cities in tapping new revenue sources was summarized in an important study, *Where Cities Get Their Money*, published by the Municipal Finance Officers association in 1946. Besides new local taxes, special service charges for such services as garbage and refuse collection and sewage disposal became more widespread. Public utilities were placed on a profit-making basis and were required to contribute either through payments to the general fund or through taxes. Parking meters, a new development after 1935, had been installed in approximately 430 cities by 1945. Of course, not all of these devices were suited to every community, and cities were advised to select those best adapted to their particular social, economic and political environment. The particular value of these local fiscal developments lay in the preservation of local initiative and independence which they helped make possible.

Increased participation by the cities in state-collected taxes and other state and federal aids was also a notable feature of the decade. Because of lack of comparable data, it was not possible to depict long-term trends in shared taxes and grants-in-aid. Many additional states, however, during the period 1941-46, provided either for new or increased shares of state taxes to go to the municipalities or for new or increased grants-in-aid. As of 1945, 42 states were reported as sharing taxes with their municipalities, and 26 as making direct grants-in-aid (*Where Cities Get Their Money*, *supra*). In the opinion of at least one recognized authority on state and local finance, state assistance in the form of shared taxes and direct grants, which in 1945 averaged approximately 16% of the aggregate revenues of cities, could be increased to at least 20% and in many states even to 25% because of the vastly superior revenue sources of the state. Undoubtedly, considerable impetus in this direction was given by the enactment by New York state in 1946 of a radically new municipal finance plan designed to stabilize finances in periods of sharp economic fluctuations. Under the plan, as promulgated by the Moore (state) Commission on Municipal Revenues after two years of research, the revenues from the shared taxes are pooled and distributed on a straight per capita basis of \$6.75, \$3.55 and \$3.00 to the cities, towns and villages, respectively. Reserves were provided to be drawn upon in depression periods and insure continuation of the per capita payments. In addition, state-local welfare services were integrated and the state share of municipal relief expenses, formerly 40%, was stepped up to 80%. On the basis of 1944, the new program of combined shared taxes and direct aids increased state assistance to the localities by more than \$50,000,000 annually. Quarterly payments under the plan began in Aug. 1946. Action by municipalities for increased shares in state-collected taxes were particularly active in many other states in 1946.

Debt.—As of June 30, 1945, the total governmental debt in the United States was \$275,200,000,000, of which federal debt accounted for \$258,700,000,000, state debt for \$2,400,000,000, city debt for \$8,400,000,000 and the other local governments—counties, schools and special districts—for the remaining \$5,700,000,000.

State and local debt, including municipal, which had risen rapidly during the first three decades of the 1900s, remained relatively stable during the depression years but declined during the war years. Thus, city debt—as distinguished from other local debt—decreased only 0.1% from 1932 to 1940; from 1932 to 1945 the decrease was 15.1% and for the period 1940-45 was 15%. The decline for 1944-45 was 2.5%. Short-term debt almost disappeared during the war years. The aggregate city gross debt for selected years from 1932 through 1945 is shown in Table III.

Table III.—U.S. City Debt*
(in millions)

Year	Amount
1945	\$8,411
1944	8,624
1942	9,806
1940	9,899
1937	10,061†
1932	9,909

*U.S. Census Bureau, *Governmental Debt in the United States: 1945*; figure for 1937 from census bureau special study *State and Local Government Debt: 1940*.

†This figure includes township debt, which was not separated in 1937.

The curtailment of capital expenditures—together with the phenomenal rise in national income which resulted in an excess of revenues over expenditures in many cities and the accumulation of reserves for debt retirement and postwar construction, accounted for the wartime reduction in city debt.

Decline in Capital Outlay.—An intensive study of city capital outlay covering the years 1937 through 1943, issued by the census bureau in April 1946 presented comparative data on the general government capital outlay and the capital outlay for city-owned enterprises of the 37 cities with 1940 populations of more than 250,000. The capital outlay of these cities constituted three-fourths of the total capital outlay of all cities with populations of more than 25,000 and so provided a substantial basis for determining trends for cities in the aggregate. The total capital outlay of the cities studied declined approximately 60% from 1937 to 1943. After relatively slight change during the four-year period 1937-40, general government capital outlay was reduced 32% in 1941, 34% in 1942 and 40% in 1943. Omitting New York city, 1937 would have been the peak year for general-government capital outlay, followed by a progressive decline.

Enterprise capital outlay similarly reached its lowest point for the seven-year period in 1943. Unlike general-government outlay, spread over a period of years under a long-range capital program, enterprise capital outlay was usually large and nonrecurrent, and tended to fluctuate sharply from year to year. The activity of a single city therefore radically affected the general trend. The expenditure by New York city, for instance, of more than \$300,000,000 in 1940 for transit unification—which represented a shift in ownership rather than a new “outlay” or investment—increased by 275% the 37-city total for that year; similarly, the individual activity of other cities affected the rate of decline after 1940. Over the period 1937-43, general-government capital outlay

Table IV.—Capital Outlay of U.S. Cities, 1937-43
(in thousands of dollars)

	1937	1938	1939	1940	1941	1942	1943
Aggregate capital outlay	\$373,468	\$357,148	\$376,752	\$731,229	\$306,440	\$216,295	\$148,460
General government capital outlay	225,189	243,538	246,385	241,637	164,277	108,237	64,803
Enterprise capital outlay	143,279	113,610	130,367	489,592	142,163	108,058	83,657

dropped two-thirds while enterprise outlay dropped less than one-half. Expansion in individual enterprises by some cities due to war needs slowed the rate of decline in capital enterprise expenditure.

It will be noted that the ratio between enterprise capital outlay and general-government capital outlay, normally about 1 to 2, changed completely beginning with 1940.

In 1943 capital outlay, both general-government and enterprise, constituted only 3.5% of the total general expenditures of all cities of more than 25,000; in 1944 it comprised but 3%.

New Borrowing.—Figures on the issuance of new long-term debt by all cities of more than 25,000 population showed that the total fell from \$213,000,000 in 1942 to \$104,000,000 in 1943 and to but \$88,000,000 in 1944, in which year more than 70% of such cities issued no new long-term debt at all. The total volume of debt issued in these years, including both original and refunding long-term issues as well as short-term debt, was \$815,000,000, \$751,000,000 and \$644,000,000, respectively. A considerable increase in the volume of new debt, as contrasted with refunding issues, was indicated for 1945 and 1946.

Municipal bond interest yields based on the *Bond Buyer's* index for 20 large municipals fell to an all-time low of 1.29% in March and April of 1946. The high point was 5.52% in Dec. 1933. As of Jan. 1937 the rate was 2.62%.

Table V.—Interest Yields of U.S. Municipal Bonds, 1937–46

Year	Rate	Year	Rate
Jan. 1937	2.62%	Jan. 1942	2.24%
" 1938	3.16	" 1943	2.17
" 1939	2.78	" 1944	1.77
" 1940	2.59	" 1945	1.62
" 1941	2.14	" 1946	1.42

Tax Rates and Collections.—Municipal tax rates tended to increase from 1937 until the United States entered World War II, when a trend toward reduction—except in the larger cities—set in. This trend was reversed, however, in 1944 and 1945, when increases of 12 cents and 22 cents, respectively, per \$1,000 of assessed valuation were noted, practically offsetting the decreases of the two years immediately preceding. An average increase of 21 cents over the 5-year period 1940–45 was reported for all cities of more than 30,000 population. Steadily mounting municipal pay rolls explained the upward trend, which doubtless would be maintained in the years ahead as pay rolls continued their upward climb and greatly increased expenditures for capital programs and maintenance work, deferred during the war, were incurred.

Assessed valuations declined during the prewar years but increased from 1941 on. The increases of 1.1% in 1944 and 1.3% in 1945 were distributed practically equally among cities of all sizes in the more than 30,000 population group; but the average increase over the 5-year period 1940–45 was confined to cities of less than 500,000 population. Cities of more than that population showed either slight decreases or only very small increases. The postwar advance in urban realty values which set in during mid-1945, in the general wake of inflation and construction shortages, was not yet reflected in city assessments of 1946.

The downward trend in tax delinquencies on current levies which commenced in 1934 was persistently maintained. Tax delinquencies rose from a median percentage of 10.15 in 1930 to a peak of 25.35% in 1933. A slow recovery then set in, the greatest gains occurring in 1935 and 1936. In 1937, the median delinquency was 11.3%; by 1944 it had dropped to 3.9% and in 1945 to 3.3%. (Data are from the annual studies of tax delinquency

for cities of more than 50,000 population by Frederick L. Bird of Dun and Bradstreet, Inc.) During this recovery period, the accumulation of taxes in arrears was also substantially reduced. Cities on the average continued to collect a total of current and delinquent taxes in excess of their current levies. The prosperity of the war years revived and extended this period of abnormally high total collections, which had shown signs of decline in the immediate prewar years. The period was also marked by improvements in tax collection administrative methods in many cities. (See also TAXATION.)

Council-Manager Cities.—By mid-1946, 638 cities and 9 counties in the continental United States were operating under the council-manager plan. These included almost 10% of cities from 2,500 to 10,000 population, 20% of cities from 10,000 to 25,000, almost 25% of cities from 25,000 to 50,000, almost 30% of cities from 50,000 to 100,000 and 25% or 23 of the 92 cities of more than 100,000 population, of which Cincinnati, O., (456,000) was the largest. No city of more than 500,000 population was operating under the plan, Cleveland, O., (878,000) having abandoned it in 1930. Of all cities of more than 5,000 population in the United States, more than three-fifths operated under the mayor-council plan; 16% under the commission plan; 17.8% under the council-manager plan; and a few in the New England states under the "town meeting" plan. While the number of adoptions of the manager plan had steadily increased, the rate of increase slowed considerably during the early '30s, reaching a low ebb in 1937. Probably as a result of the intensified interest in the preservation of local self-government that characterized the war period—in contrast to the totalitarian systems so much in evidence abroad—there were more adoptions of the plan in the 5-year period 1941–45 inclusive (119 municipalities) than in any other 5-year period except that immediately following World War I. The early months of 1946 indicated an accentuation of this trend.

Abandonments of the plan by popular vote were relatively few: only 28, including 1 Canadian city, after its inauguration in 1908. There were but 8 abandonments during the years 1937–46, compared with 15 from 1925–37. A major survey and appraisal of the plan in the United States undertaken by the Committee on Public Administration of the Social Science Research Council was published in the following three volumes in 1940: *City Manager Government in the United States*, by Harold A. Stone, Don K. Price and Kathryn H. Stone; *City Manager Government in Nine Cities*, by the same authors; and *City Manager Government in Seven Cities*, by Frederick C. Mosher and others.

Proportional Representation.—Five additional U.S. cities adopted the proportional representation method of electing their legislative bodies during the decade 1937–46. These were: Yonkers, N.Y., 1938; Cambridge, Mass., 1940; Lowell, Mass., 1942; Long Beach, N.Y., 1943; and Coos Bay, Ore., 1944. New York city, which had adopted this method in 1936, held its first P.R. election in 1937, as a result of which the Tammany forces were reduced from an overwhelming majority in the elective governing body to an even half. Boulder, Colo., Cincinnati, Hamilton and Toledo, O., and Wheeling, W. Va. were also P.R. cities, making a total of 11 in the United States. It may be noted that only one city, Ashtabula, O., in 1929, had abandoned P.R. as a result of a direct vote on that issue. It was rejected in Cleveland in 1931, as a part of the

city manager charter which was abandoned at that time. In Sacramento, Calif., P.R. was held unconstitutional by court decision after its initial use in 1921, and in Kalamazoo, Mich., it was likewise invalidated by court decision following its use in 1918 and 1919. Its use by West Hartford, Conn., was curtailed by legislative act—later modified—in 1923. The constitutionality of P.R. was directly upheld in Ohio, Massachusetts and New York.

Civic Activities.—The decade 1937–46 was not a period of notable political activity. There was nothing comparable to the Seabury investigations of New York city which resulted in the reform regime of Mayor La Guardia from 1934 to 1946. Certain substantial gains, however, were recorded. The citizens of Kansas City, Mo., after six years of effort, succeeded in ridding their city of machine domination in 1940. Louisville, Ky., enjoyed an exceptionally sound administration under Mayor Wilson Wyatt (1941–45). A reform administration was unexpectedly swept into office in New Orleans, La., in 1946. At the same time, the period was one of active civic life and citizen participation in government, particularly during the war years.

There was a marked growth in taxpayers' organizations and independent bureaus of research, together with citizens' leagues, research departments of chambers of commerce and other citizen-supported governmental research agencies. These increased by more than 50% in number over the decade and were on a sounder financial basis at the close than at the beginning of the period. Taxpayers' organizations, which began originally with rather naive programs, were coming more and more to grips with central problems of administration and finance. The output of studies in governmental research was of high calibre. The reorganization of the Governmental Research association secretariat, which moved its offices to New York city in 1945, augured well for future developments in the governmental research field.

Housing and Urban Blight.—The establishment of the U.S. Housing authority as a permanent agency in 1937 marked the beginning of public housing as a normal governmental function in the United States. The number of local housing authorities increased from less than 50 in Dec. 1937 to about 500 in 1945. Residential construction in 1941 reached its highest levels since the late '20s. Yet an almost continuous housing crisis in one form or another prevailed during the decade.

The failure to modernize living and community facilities in line with contemporary developments in housing, commerce and transportation created a major problem of urban blight in many of the larger cities, which contributed seriously to their economic decline before the war. This situation is considered more fully below. The war itself resulted in an acute shortage of defense housing in war industry and military centres, which was met largely through enormous federal appropriations for the provision of temporary war housing. A total of more than \$2,000,000,000 of federal funds for publicly financed war housing projects was appropriated in 1941 and 1942. The sudden end of the war in 1945 found the cities totally unprepared to meet the appalling housing situation that confronted them in spite of adequate warning, because of a combination of factors, including the prewar housing shortage, cessation of normal residential building during the war, increase in number of families over the war period, precipitate release of veterans after V-J day and failure on the part of the communities to provide for an obvious postwar need. Thus, in 1946, urban communities were faced with

the problem of providing housing and other services for an urban population estimated at about 114,000,000—or more than 80% of the population of continental United States—on the basis of prewar facilities adequate for not more than 100,000,000. While the problem was recognized as primarily local, as the municipalities had to provide the necessary sites, services, labour and materials, the very magnitude of the situation, affecting as it did the entire national economy, called for federal leadership in setting a national housing goal and stimulating the flow of materials.

The president named Wilson Wyatt, former mayor of Louisville and former president of the American Municipal association, as housing expediter in charge of the national emergency housing program in Dec. 1945. Wyatt also headed the National Housing agency. The federal government acted to effect price adjustments in the field of building materials and instituted premium payments to producers to increase their output, besides providing other remedial measures. A housing goal of 1,200,000 dwelling units to be started in 1946 was set by Wyatt. Some 607,000 had been started by the end of July; the number of permanent units actually completed by that time totalled 194,200, or 287,100 if temporary housing, such as trailers and converted structures, was included. Nonessential construction above certain limits was prohibited by order of the Veterans' Housing Program early in 1946, in order to prevent all new housing construction other than veterans' housing costing less than \$10,000, including site and utilities; new construction of almost all public buildings except by permission of the Civilian Production administration was halted. The cities were called upon to form mayors' emergency committees representative of local government, industry, labour and the public to speed up provision of veterans' housing and to combat inflation. A number of cities, including Chicago, Pittsburgh, San Diego and Philadelphia, undertook to revise and modernize their building codes so as to make available new types of building materials and new techniques. Use of park lands for temporary housing units was authorized in several cities, including Chicago, Los Angeles, Eugene, Ore., and Cincinnati. By Sept. 1946 Chicago and New York had made the greatest progress in providing emergency housing for veterans, with 800 homes already occupied in the former city and 729 in the latter. Less than 75 were occupied in Boston and none in Philadelphia and Detroit. Difficulty in providing sites retarded the program in some cities. Shortages of critical items caused by the black market in building materials, as well as labour difficulties and the curtailment of federal funds for emergency housing in the localities, slowed up the program generally.

Cities were warned by official planning and finance bodies of the need for orderly subdivision control, both within and beyond the corporate city limits, in order to prevent chaotic debt and tax conditions such as had followed World War I. By 1946, 43 states had passed legislation enabling some or all municipalities to adopt subdivision control regulations. Appropriate measures toward this end were adopted in a number of cities. It was pointed out by Wyatt that "today's crisis is just as much a planning emergency as it is a housing emergency." He warned municipalities against locating veterans' housing in existing slum areas or in outside areas requiring the provision of extra schools, utilities and other community services. He advocated revision of zoning ordinances, if necessary, to permit the building of veterans' housing in the better residential districts and the provision of ade-

quate light, air and other health facilities.

Urban blight, occasioned by the migration of the urban population to the outlying suburbs, either within or without the city limits, combined with the movement of business concerns to newer city areas and their establishment of lucrative branches in the suburbs and the failure to modernize the properties left behind, had seriously affected land use and land values, leaving to the central city baffling problems of tax delinquency, reduced valuations and increased debt and tax burdens. The 1940 census revealed the extent of declining populations in the larger cities. A ten-year survey covering the period 1930-40 showed that cities with a declining population had increased their tax rate twice as much as the growing cities, while their assessed valuations had declined to a greater extent. According to one estimate, urban blight had spread to one-fifth of urban United States, covering property assessed at approximately \$40,000,000,000 and involving the welfare of about 50% of the urban population. Studies of specific cities indicated that the cost of blight amounted to from 10% to 20% of their annual budget. The remedy put forward by the National Association of Real Estate Boards was large-scale replanning and rebuilding, with provision of adequate housing.

Urban redevelopment legislation of some type was therefore enacted in about half the states in the period 1941-46. According to the Urban Land Institute, redevelopment legislation was of three types, with some states having two or more types: (1) redevelopment corporation laws, to encourage large private financial institutions to participate in slum clearance through construction of housing projects—passed in 12 states; (2) housing redevelopment laws, enlarging the powers of local housing authorities to make them the development agency, passed in 7 states and introduced in 14 others; here the emphasis was on the low-income group, with the Federal Public Housing authority largely in control of the local housing authorities; and (3) redevelopment land agency laws, establishing new redevelopment agencies controlled entirely by the local government, which could assemble land, issue bonds and sell or lease the land to private enterprise—passed in 12 states. The new Missouri state constitution also authorized cities operating under its constitutional charter to acquire areas for redevelopment.

The earlier legislation fostered the development of the private redevelopment agency, limited to the development of individual projects. Later legislation (1945) favoured the public agency, which would permit redevelopment of individual projects on a much broader scale, in conformity with a comprehensive redevelopment plan. The Stuyvesant Town redevelopment under way in New York city, covering 129 ac. and including more than 12,000 apartments designed to house 40,000 people, was an example of the first type of redevelopment plan mentioned above, while Detroit commenced in 1946 a similar project on a 98-ac. blighted area under the third type of redevelopment listed above, with several individual projects incorporated in the over-all plan. New York city also pioneered in 1946 with plans for the first co-operatively owned redevelopment project—the East River Co-operative apartments—chartered under the state urban redevelopment companies law.

Planning.—Following the early depression years, cities began to realize that some of their economic ills could be ascribed to a wholly inadequate planning concept. The need for specific data on population and population trends, industrial resources and many other social and economic factors, additional to the need for development of

physical facilities such as streets, sewers, parks and other public works, led to greatly enlarged planning activities throughout the nation. The National Resources committee—predecessor of the National Resources Planning board—published in 1937 its significant study, *Our Cities—Their Role in the National Economy*, which was the first attempt to deal with urban conditions on a nation-wide basis. This study was made at the request of a number of national organizations, including the United States Conference of Mayors, the American Municipal association, the American Planning and Civic association and the American Society of Planning Officials. The enormity of the unemployment relief problem in the cities during the early 1930s was one of the factors prompting this undertaking. The recommendations of the committee covered such urban problems as chronically depressed areas, social welfare programs, rehousing of low-income groups, personnel standards and public service training and included proposals for federal aid for public works construction in times of economic stress, a permanent federal public works authority, federal aid to state, regional and local planning agencies by a permanent federal planning board, a federal study of conflicting intergovernmental fiscal relations between the local, state and federal governments, and legislation permitting the handling of urban problems such as health, welfare, planning, public utilities and so on, on a regional basis in metropolitan areas extending beyond state lines.

While some of the objectives of the committee were dealt with piecemeal through various federal channels and agencies, the failure to create a permanent federal planning organization after the liquidation by the congress of the National Resources Planning board in June 1943 retarded planning progress in the United States and prevented developments as comprehensive in scope as those envisaged, for example, by the famous Uthwatt committee report in England (1942) on land control, compensation and rebuilding (*Report of the Expert Committee on Compensation and Betterment*).

Local planning developments over the intervening years included the provision of better facilities for the training of planners, notably at the University of Buffalo, N.Y., Harvard and Western Reserve university, Cleveland, O., and the marked expansion of the scope of city planning. The New York State Planning council in 1938 published a major study of the disastrous effects on local government finances of the premature subdivision of land for urban purposes in outlying metropolitan areas (*Premature Subdivision and Its Consequences* by Philip H. Cornick of the Institute of Public Administration, New York city), which resulted in legislation in that state for the better regulation of subdivision platting activities. In the same year, New York city's radical new charter with its provision for greatly enlarged planning powers in the City Planning commission took effect. Other cities with outstanding planning agencies—to mention but a few—included Baltimore, Chicago, Los Angeles, Detroit, Pittsburgh, Philadelphia, Cleveland and San Francisco. During the war years, local planning bodies were actively concerned with actual war problems and with the preparation of postwar plans. Considerable federal assistance was given to the state and local governments in the preparation of postwar long-range public improvement programs; the National Resources Planning board published in 1941 its helpful *Long-Range Programming of Municipal Public Works*. There was increased dependence on regional rather than municipi-

230 pal planning in connection with such wartime needs as evacuation programs, traffic relief and transportation plans, war housing and postwar planning. The regional planning committee of the Detroit defense area, for instance, represented ten cities. Louisville and Milwaukee, Wis., besides many other cities, similarly inaugurated regional planning developments.

In 1946, according to a survey covering 700 cities, cities were spending about 50% more for municipal planning than in 1945; more than 86% of the reporting cities of more than 25,000 population had either official or unofficial planning agencies, whereas 30% of the cities in the 10,000-25,000 population group had no planning agencies.

In spite of oft-repeated warnings regarding the involved traffic conditions in all urban areas which the return of automobile production would bring, no new or practical solutions to alleviate parking and traffic problems appeared during this period.

Postwar Programs.—During the war years, public works construction except when necessitated as part of the war effort, came practically to a standstill. Communities were urged, however, to accumulate financial reserves and to prepare plans for the postwar period when, with the expected availability of manpower and materials, public works construction might be utilized to offset possible widespread unemployment. But the housing emergency at the war's end postponed almost all construction not related to housing needs. Meanwhile, state and local governments had proceeded more or less unevenly with the preparation of postwar plans. One of the biggest deterrents to adequate local planning was the lack of a federal policy after the demise of the National Resources Planning board, as to whether or not to provide public funds to assist the local planning agencies. Appropriations were finally voted in 1945—\$17,500,000 in May and \$12,500,000 in Dec.—on a quite inadequate scale. By May 1946 all but \$2,000,000 of these funds had been advanced to state and local agencies, and the allocation for advances in 22 states was completely exhausted. An additional \$35,000,000 was accordingly appropriated in June 1946 to be available until June 30, 1947.

The most comprehensive review of the status of state and local postwar planning was presented in the Dec. 31, 1945, semiannual report of the Bureau of Community Facilities of the Federal Works agency, submitted in March 1946. By the end of 1945, applications for advances amounting to \$13,200,000—representing public works with an estimated total cost of \$564,000,000—had been approved. More than 70% of the construction costs for which planning advances were approved were for sewer and water facilities, school and educational facilities and hospitals—all projects vital to the development of an expanded housing program.

The bureau found that in addition to federally-assisted planning, the states and localities reported completed plans for public works with an estimated total cost of \$961,000,000. It was estimated that funds were on hand or arranged for to cover 45% of this total cost. Nearly one-half of such proposed public works, in terms of construction costs, however, were concentrated in New York state alone, with New York city accounting for 40%. Plans in the design stage amounted to \$4,404,000,000 in estimated total costs. Again, these were concentrated largely in a few states, and in many instances had not progressed very far. Some doubtless would not be completed without federal aid.

The most satisfactory progress reported was in the planning and construction of roads and highways under the federal-aid highway program.

The survey indicated on the whole considerable unevenness in the extent of postwar plan preparation. A disturbing number of communities had no plans either in the completed or design stage, and the volume of completed plans was far below construction requirements of the next few years. It became clear that local governments, particularly the smaller communities, would not prepare development plans for public works without state or federal stimulation, aid and supervision.

It should be noted that while a federal-aid program of advances (*i.e.*, loans, not grants) for state and local planning was authorized in 1944 and was under way in 1946, no federal program of either loans or grants to such governments for miscellaneous construction purposes—exclusive of specific measures for highways, hospitals and airports—had been adopted by mid-1946. This policy accorded with the view that federal aid, other than planning advances, should not be extended for miscellaneous public works of purely local importance unless the development of highly adverse economic conditions should warrant it.

Airports.—The postwar years brought considerable activity in municipal airport planning, in anticipation of vastly expanded postwar air line needs. The federal aid program for airport construction enacted in 1946 would doubtless greatly accelerate municipal activity in this field. But the full effects of greatly increased air travel would not in all likelihood be felt for at least another ten years. Meanwhile, much remained to be done by the municipalities to place this developing function on a stable basis. A study of 51 selected airports by the Harvard Business school in 1946 showed a deplorable condition in municipal airport finance. As far as records were available, it appeared that only one airport was covering full costs, including interest and depreciation, while the total revenue of airports studied showed a representative ratio of only 2% to total investment. Airports, financially, were anything but going concerns. Cities were endeavouring to meet the situation through the development of nonaviation concessions, such as restaurants, spectator ramps and other enterprises, as well as by raising the landing or service fees for plane operators.

As a result of a survey of the Newark, N.J., airport by the bistate port of New York authority in 1946, followed by a request to the authority for a similar study of New York city's airports, an integration of airport facilities in the greater New York and northern New Jersey area appeared likely.

Cities and the Atomic Bomb.—The advent of the era of atomic warfare raised the question of the vulnerability of the modern concentrated city in the atomic age. Though the atomic bomb took the spotlight of attention in U.S. headlines, military leaders generally agreed that controlled missiles, synthetic poisons and other developments were even more significant than atomic bombs for cities and congested populations in the event of future war. The wreckage of the cities of the world and the far greater effectiveness of new weapons developed but not used in World War II thus raised a series of new problems at a time when cities had not yet learned how to meet the changes arising from the automobile, not to mention the changes still to be made to meet the demands of air transportation, air conditioning and a host of other technical developments.

As to safety from atomic bombs, there was no disagreement that the ideal solution lay in an effective world or-

ganization for the control of atomic warfare and of the new flying missiles, if not of warfare itself. However, a national policy of planned decentralization of U.S. cities into separated urban areas of some 50,000 population and the permanent scattering of industries was suggested as a secondary solution, not solely as a defense measure against the bomb, but as a defense measure also against the growing evils of urban blight and traffic congestion. Such an idea had its precedent in the garden city proposals of the English planner, Sir Ebenezer Howard—a new edition of whose 40-year-old classic, *Garden Cities of Tomorrow*, appeared in the United States in 1946—and was embodied in the Abercrombie Greater London plan, accepted officially by the British government. One argument for this view was that the atomic age had simply precipitated a change in scientific city planning which the spread of urban decay had already necessitated.

Though not designed specifically to meet the threats of atomic warfare, the Boston Prize plan of 1944 gave striking publicity to a program for federating the independent municipalities of the Boston area, giving a local self-governing basis to the existing state metropolitan agencies and organizing, equipping and financing a new decentralization of population and industry within the framework of the federated metropolitan government. After Hiroshima, this plan was defended by its proponents as a method of meeting the threat of atomic warfare.

In spite of these discussions and plans there were no evidences of action in the United States through 1946 looking toward the organized decentralization of industry or population for strategic or other reasons.

Great Britain

At the outset of the period 1937–46, the framework of municipal government in Great Britain had reached what appeared to be a condition of stability following the reforms and readjustments of poor law and other services under the two Local Government acts of 1929 (one for England and Wales and one for Scotland). The modified system had settled down into fair running order. The experiment of making, in place of some of the numerous separate grants, a general exchequer contribution for municipal services generally, and its apportionment among local authorities as a block grant, had become an integral part of the finances of municipal government. The Local Government act, 1933, had redefined the constitution and general powers of the various types of directly elected local authorities in England and Wales, and a similar redefinition in respect of London local authorities was enacted in the London Government act, 1939.

At the opening of the decade, certain trends which later became more pronounced were already evident. Signs of the events of the ensuing years were beginning to emerge. One important trend was the transfer of functions from local authorities to the central government. The transfer in 1934 of the able-bodied unemployed from the ambit of local poor law administration and in 1940 the payment of supplements to old age pensions to the national assistance board provided examples of this. Another trend, some-

what akin to this, was demonstrated in 1938 by the Fire Brigades act, which empowered local fire brigade authorities to combine for mutual aid, thus giving expression to the idea of organizing local services on a regional basis.

The recognition of the need for national physical reconstruction was evident in the numerous town-planning schemes then in draft or in early stages of application. A great slum clearance drive, under the guidance and encouragement of the central government, was being undertaken by local authorities throughout Great Britain.

But World War II intervened, and the years which should have seen the end of slums and overcrowding in Great Britain saw devastation from aerial bombardment in many of the chief urban centres of the country. The experience gained in those prewar housing operations was not lost, however, for it later helped the authorities, both national and local, to frame plans and programs for the great drive toward postwar reconstruction.

Before 1937, the municipalities were made officially aware of the danger of war, for the government in 1935 had sent them a directive on the subject of air raid precautions. With the Munich crisis in 1938, activity on general civil defense preparations became intense. The central government instructed the municipalities to put aside their housing and other developments, and to give first priority to the preparation of schemes of protection against air attack.

Local Government in War: Civilian Defense.—The impact of World War II upon the activities of local authorities was profound. Capital works such as schemes for new housing, for educational expansion and road improvements were virtually brought to a standstill by order of the government, which at the same time placed on local authorities the new and heavy responsibility of providing various civil defense services. These war duties, however, did not suspend all the normal functions of local authorities. The public health, education, public assistance and other services had to go on, under the difficulties of war conditions, side by side with special war activities.

These wartime activities were directed towards safeguarding and assisting the civil population, and included the building of public air raid shelters; the organization of local ambulance services; the provision of rest centres and billets for persons rendered homeless by bombing; the administration of rescue services to extricate persons from damaged buildings; the removal of debris and dangerous buildings; the co-operation in an emergency hospitals service by which hospital resources were pooled to meet the needs of war; the schemes for evacuating from vulnerable areas children, mothers, elderly and blind people to places of greater safety; the distribution of gas masks (which fortunately were never used); the provision of allotments for food growing and the establishment of local fire guards and firewatchers. The local fire brigades, greatly expanded to meet war needs, were also the responsibility of local authorities until 1941, when the brigades were amalgamated and transferred to the national fire service.

In addition, local authorities were active in the local arrangements for the distribution of food and fuel and the repair of war damage, and may be said to have assumed the role of protectors, guides and advisers to the civil population. The ordinary citizen who, in prewar days, was prone to look upon his local council as a rate-collecting body, to be grumbled at or even ignored, so long as the public services were maintained, came in wartime to turn increasingly to the town hall and the county hall for ad-

232 vice and assistance on the many and novel features of wartime existence. Most local authorities set up local information centres for the special purpose of dealing with the numerous inquiries from the general public.

The cost of the civil defense services was very largely reimbursed by the central government. The cessation or slowing down of normal activities led to a reduction in expenditure on their provision which in some areas more than counterbalanced the net cost of their wartime functions. As, however, the results of evacuation of people and businesses, especially from the evacuation and defense areas, manifested themselves, and properties were destroyed by bombing and thereupon ceased to be ratable, the loss of rate income was such that in many cases special financial assistance from the government was necessary. In other areas the development or the establishment of war industries led to a marked growth in ratable value.

The method by which the civil defense services were co-ordinated was unusual in British tradition. The country was divided into large civil defense regions, comprising the areas of several counties and embracing a number of municipalities. For each of these regions a civil defense commissioner was appointed by the central government, to which he was responsible. But this radical departure from normal democratic practice went no further. For although the civil defense commissioners co-ordinated, guided and to some extent controlled the operation of the civil defense services, with the exception of the national fire service after 1941, the provision and administration of the services was left in the hands of the separate councils themselves, who also carried on their normal peacetime services free from interference. In this way the democratic element of British local government was preserved. With the cessation of civil defense activities, the office of the civil defense commissioners came to an end.

Within the domestic organization of the local authorities themselves, there was also a temporary departure from accepted practice. At the outbreak of the war, many local authorities curtailed their normal procedure and set up emergency committees of a few members with power to carry on all the work of the councils. Control was thus concentrated in the hands of a few. But these arrangements, made under the stress of emergency and uncertainty, to meet the unknown dangers of air raid or invasion, were accepted only for so long as necessity required. It seemed clear from these experiences that, although a certain curtailment of normal democratic methods of control by elected representatives might be inescapable in circumstances of special danger and difficulty, the British temperament would not suffer such for longer than was absolutely essential. (See also AIR RAID DEFENSE.)

Growth of Public Interest.—During the ten years 1937–46, and notably in the last two, there was a great swing to the left in British local government. The Labour-Socialist movement gained ground in almost every area where contests for local elections were run on political lines. This was in some measure due to a growing appreciation of the fact that upon the extent and quality of municipal services the health, comfort and well-being of the local community largely depended.

However, this undoubted growth of popular interest in local government activities was not reflected in the percentage of persons voting in the municipal elections in Great Britain in 1945 and 1946, which generally was very low and in some areas the lowest on record. Small polls were the rule after the war of 1914–18. One explanation

might be that at such times the public mind was focused on the wider national and international issues, and attention to local matters diminished correspondingly. The low percentage of votes cast at these times did not necessarily mean a permanent lessening of public interest in municipal affairs. In fact, the public awareness of the importance of municipal services was never more alert and active than during the six years to 1946. The experiences of war brought to light many deficiencies and shortcomings and gave a powerful stimulus for improvement and enlargement. Thus in Great Britain, when hostilities ceased, a general desire had crystallized for improved educational facilities; for effective replanning of towns and cities and the preservation of beauty in the countryside; for better housing of the people generally and for enlarged public health services for all. Indifference to these needs was replaced by active and clamant demand.

Structural Adjustment.—During the decade 1937–46, technical developments in many fields, such as modern transport and communications, and the inequalities of financial resources and equipment in many areas, combined with wartime experience, demonstrated the need for larger areas of administration. To some observers a complete recasting of the territorial basis of local government seemed to be called for. By the act of 1944, public education was reorganized on a broader basis than before the war. In 1945 a local government boundary commission was appointed by the government with power to review and adjust, on an empirical basis, the areas and status of local authorities as conditions required.

Thus, the decade was a period of change and challenge for British local government, during which it faced and surmounted the greatest difficulties in its history. Much was learned from these eventful and formative years, from which would emerge gradually, as befitted British tradition, new units of administration more appropriate to modern requirements, but in which would be preserved the vital principle of elected representatives, publicly responsible.

Continental Europe

On the continent of Europe the years from 1937–46 saw a marked decline in democratic local government. In the totalitarian countries it had virtually disappeared before World War II, while in the occupied territories it was permitted to function only as the invader prescribed. The experience of dictatorship and invasion led to a great awakening of the belief in democracy, especially in the management of local affairs, which was seen to be one of the cornerstones of the structure of free government of the people by the people. In the liberated countries, a passionate interest in the British municipal way of life had shown itself; in the axis countries, the first approach to the re-establishment of representative government had been through the creation of elected local government authorities. At the close of the decade the world picture was one of growing interest in municipal services as an essential element in advancing civilized life, with a resurgence of faith in the principle of democratic local government. (See also HOUSING; TOWN AND REGIONAL PLANNING.)

Munitions of War

In the ten eventful years, 1937-46 inclusive, the trend in new production of the tools of war was toward greater mobility and greater striking power. Those two principles were carried out even in dealing with the human elements of war, wherein the United States, for example, substituted the flexible "triangular" form of divisional organization for the former "square" type of organization. The objective was to so organize and arm as to be able to strike quickly and hard.

Army munitions fall roughly into three broad classes: (1) artillery; (2) small arms; (3) ammunitions. Each has many ramifications. A consideration of the first, artillery, admits of the following broad lines of classification: horse-drawn, pack, truck-drawn, self-propelled, railway, coast defense, aircraft and anti-aircraft.

Artillery.—By calibres, artillery fell into three broad classes during World War II: (1) light, pieces up to and including 105-mm. howitzer; (2) medium, 155-mm. howitzer and 4.5-in. gun; (3) heavy, 155 mm. gun, 8-in. and 240-mm. howitzer, plus seacoast artillery ranging from 8-in. to 16-in., the latter frequently railway-mounted in open terrain.

Anti-aircraft Artillery.—Just before World War II, anti-aircraft weapons were 3-in. guns, along with .30- and .50-calibre machine guns on pedestal mounts, limited to 67° elevation. More powerful and far reaching weapons developed later, among them the .50-calibre machine gun on single and multiple mounts permitting fire up to 90° elevation at the rate of 800 rounds per minute; the .37-mm. and .40-mm. rapid-fire anti-aircraft guns; the 90-mm. gun mounted on a single-axle, dual-wheel carriage, and the "stratosphere" gun, 120-mm., firing 11 mi. into the air (it could also be depressed and used on ground targets). The auxiliaries of anti-aircraft firing kept pace with weapon developments. Searchlights with their accompanying power plants were developed so as to stab searching beams of light to great distances in the skies to spot raiding planes; sound detectors and the latest radar developments helped to localize the flying targets; control stations were developed to the point where all data necessary to aiming the gun and setting the fuse were calculated speedily and automatically. However, splendid as the records of these anti-aircraft weapons were in World War II, it was doubtful if they would play any decisive part in wars of the future. Devastating rockets guided by remote control plus supersonic aircraft, capable of terrific speeds, would, it was believed, render the anti-aircraft guns of World War II obsolete.

Aircraft Artillery.—When artillery went "upstairs" and became part of aeroplane armament, the 20-mm. cannon was, for a considerable time, the standard heavy gun of the plane. It was supplemented by one or more .30-calibre machine guns per plane. As plane types were improved and more and heavier bombing planes (e.g., the U.S. Mitchell bomber) came into use, a 75-mm. cannon was mounted to fire from the nose. Initially, gun mounts in aeroplanes were fixed, but these were rapidly replaced by flexible mounts affording a wide field of fire. By synchronization, weapons fired their missiles through the whirling blades of the propeller, and, in the B-29s, all defense guns of the plane could be controlled and fired, if necessary, from a single central control room in the plane.

Coast Defense Artillery.—In terms of modern warfare, this tremendously heavy-calibre artillery became nearly worthless. In World War II, heavy guns along the Dover coast of England and the Calais coast of France banged away at each other. But German robombs launched from France found their targets in industrial England with no interference from seacoast artillery. A fixed emplacement such as was necessary for these big, immobile guns was a particularly easy target for a plane to strike from the rear. The invasion of the Cherbourg peninsula was not made under protection of heavy seacoast artillery firing from the rear but under an umbrella of aeroplane support from the sky and heavy, destructive fire from naval units brought close in.

Field Artillery.—The next item of consideration is, of course, the artillery fighting with the ground troops in the field. In this connection it must be remembered that during World War II the air force fought with the ground forces; low-flying bombers which strafed enemy ground, aiming to take out distant targets were, in effect, long-range artillery supporting ground force action. In Sicily, even navy artillery stood in close to blast enemy forces from roads which Allied troops needed to use. However, what follows here will be a brief discussion of artillery as it is popularly known in ground operations.

In the early years of World War II, Germany enjoyed an unquestioned superiority in artillery weapons. The German attacks through the Low Countries were spearheaded by mechanized artillery which rolled up all opposition. Striking power of tremendous force was achieved by modernization and mechanization of previously existing types of weapons and by the development of previously unknown types. Artillery which could be mechanically towed or which was capable of self-propulsion was the only thing that counted after the German disclosed his hand. Against the battering force of the German howitzers, ordinary fortifications crumbled—the famed Maginot line disappeared as an impregnable barrier almost as though it had been a myth.

As the decade 1937-46 began, the tendency of all nations was to attach more and more artillery pieces to infantry regimental strength. In 1937-38, soviet regiments included 81 light machine guns, 60 heavy machine guns, 27 grenade throwers, 6 cannon (37-mm.), 6 regimental cannon (76-mm.) and 2 anti-aircraft guns. Italian regiments included 4 pieces of pack artillery and 65 17-mm. cannon. U.S. regiments carried 72 light machine guns, 36 heavy machine guns, and 36 light mortars.

From 1940 onward it was evident that complete mechanization of the artillery arm was a necessity. Eventually, even huge guns like the 155-mm. "Long Tom" of the closing year of the war were so built as to be broken down into easily handled, quickly transportable units.

On the ground, field artillery mechanization was achieved rapidly. Prime movers with full or half-track traction hauled the huge guns into position; many of the heavier pieces were full mounted on tank chassis to achieve complete self-propulsion; smaller pieces like the 37-mm. anti-tank gun were mounted on pneumatic-tired carriages for quick shifting into and out of positions.

Along with the step-up in mobility came improvement in design, increase in calibres, higher muzzle velocities, greater destructive striking force. In the United States, by 1941, field artillery units included 75-mm. guns and howitzers and 105-mm. howitzers; corps artillery had 155-mm. guns and howitzers. A new 4.5-in., destructive in its

use against tanks, was successfully used in 1941. The 105-mm. howitzer was supplanting the famous World War I 75-mm. weapon.

Early in 1942, Britain began replacing its old 18-pounder (83.7-mm.) field guns with 25-pounder 88-mm. calibres. Russia had all its 115-mm. field guns on motor carriages, and also had its big 8-in. howitzer built to be transportable in 2 loads—the carriage on a broad caterpillar track; the tube on a 6-wheeled carriage, both drawn by a caterpillar tractor on which the crew rode. Russian field artillery calibres in this year were 76.2-mm.; 107-mm.; 122-mm.; and 152-mm.

U.S. field artillery units became armoured units with self-propelled 105-mm. howitzers mounted on medium tank chassis, and supplemented by .50-calibre machine guns.

In 1942, Japan used lightweight rocket cannon for the first time in its siege of Singapore.

One U.S. artillery weapon was a standout in 1943—the 4.2-in. chemical mortar. It was a rifled weapon with a 2-mi. range and was used for just about every type of destruction expected usually from much heavier artillery.

In this year, too, the U.S. army brought out the M-10, a weapon designed as a tank destroyer. It was, in effect, a land cruiser capable of coping with anything in battle. Another heavy antitank weapon was the M-12, a 155-mm. gun mounted on a medium tank chassis. In the North African campaigns of 1943, Allied self-propelled weapons brought down axis planes and broke up German communication lines.

The year 1944 brought out the powerful 76-mm. gun. Mounted on an M-4 medium tank chassis, it was a decided improvement over the 75-mm. in muzzle velocity, range and penetration. It was used at once in U.S. aeroplanes. That year also showed that the term "pack artillery" had acquired a new significance. Originally, it applied to the type of artillery which could be disassembled and assembled for mule or horse transport in mountainous regions. But now the paratrooper was concerned with the number of packs his weapons could be broken down into so that they could accompany him as he dropped from the skies onto enemy terrain. One of the efficient weapons in this class was the .75-calibre pack howitzer which could be dropped from the skies in 7 loads and could reach action in 7 minutes after the crew and parts left the plane. The heavy weapons of that year were the 8-in. gun and the 240-mm. howitzer, both highly mobile. The 8-in. was familiarly known as the "Black Panther."

In the closing year of the war, 3 new artillery pieces were put into the field by the Allies, the 155-mm. howitzer, motor carriage M-41; the 8-in. howitzer, motor carriage T-89; and the 155-mm. gun, motor carriage M-40. All were extremely mobile, and their addition increased firepower of ground forces.

Tanks.—The problem of tank building in 1937-38 presented two items, armour and speed. Ordinary 37-mm. thick armour would not stop infantry cannon shell. Speeds were, accordingly, revised downward and armour was thickened. Tank armament at this time was usually one 37-mm. cannon and one or more machine guns per tank. There was considerable experimentation with Diesel power plants. France and the U.S.S.R. were building tanks up to 70 tons, but they were purely experimental since the early tendency was toward standardizing on a light tank of 8 to 9 tons, and a heavier tank, not over 15 tons. The large tanks were to mount guns up to 4- and 6-in. calibres. The Spanish Civil War afforded a testing ground for tanks.

The principal types were the German light tank, the Spanish light (Trubia), the Italian tankette, the French Renault, the Russian light (T-26) and the Russian medium (T-28). The German type weighed $5\frac{1}{2}$ tons, mounted 2 machine guns and had a speed of 30 m.p.h. The Italian weighed 3.6 tons, mounted 1 or 2 machine guns, and had a speed of 27 m.p.h. The Russian types ranged in weight from 7 to 19 tons, with speeds up to 40 m.p.h. Their largest tank mounted a 45-mm. cannon and 3 machine guns.

By 1940, tanks were classified in 3 general groups: accompanying tanks, light, 10 tons, 5 to 6 m.p.h. speed, 37-mm. cannon armament, armoured to resist infantry weapons but not antitank cannon; leading tanks, 15 to 17 tons, speed 5 m.p.h., 47-mm. cannon and 2 machine guns armament, and carrying short-wave radio; and special mission tanks, heavy, to attack antitank batteries and hostile tanks, 20 to 30 tons, speed very slow, 75-mm. and 155-mm. armament, armoured $1\frac{3}{4}$ to $2\frac{1}{2}$ in. thick. This latter type could withstand shell from 75-mm. field guns but their lack of speed and great weight seriously limited their use.

The following year emphasized the value of the medium tank—25 to 30 tons, 30 m.p.h., 75-mm. gun, 37-mm. gun and machine gun armament. It proved far better in desert warfare. German tanks of this period halted to fire; U.S. tanks, fitted with superior fire-control equipment, fired effectively while in motion. Two structural changes were emphasized for desert fighting: substitution of air-cooled for liquid-cooled engines and substitution of moulded rubber treads for steel caterpillar treads.

German Field Marshal Erwin Rommel used a Mark IV tank in his 1942 campaigns in Africa. It weighed 22 tons, had a speed of 22 m.p.h., and was armed either with a short 75-mm. cannon or with high velocity 50-mm. guns. However, this tank could be knocked out by the U.S. General Grant tank and was much inferior to the later General Sherman tank of the U.S. army. Since Rommel depressed the 88-mm. anti-aircraft gun and used it against the U.S. tanks, the commanders of these units were forced to outmanoeuvre him to avoid destruction. In this same period, Japan was using tankettes, 3 to 4 tons; light tanks, 5 to 7.7 tons; medium tanks, 15 tons; and heavy tanks, 35 to 36 tons.

By 1943, the United States led the world in tank production—as high as 5,000 in 2 months. During 1944, the U.S. Sherman tank mounted the new 76-mm. cannon, noted for its great muzzle velocity. Some Shermans mounted 105-mm. howitzers.

In the last year of active operations, the British used a 95-mm. howitzer as a part of tank armament, firing high velocity shells. The U.S. army perfected the 43-ton M-26 General Pershing tank with a long-barrelled 90-mm. gun firing a shell with a muzzle velocity of 3,750 ft. per second, capable of penetrating 14 in. of armour at 300 yd.

Antitank Weapons.—This classification moved throughout the ten eventful years from the lightly armoured cars of 1937-38 to the smashing, self-propelled giants of 1945. The problem of beating the tanks was first approached by developing "tank chasers," later known as "tank destroyers," and "tank traps." The original tank chasers were lightly armoured cars of high manoeuvrability carrying 42-mm. guns capable of penetrating tank walls. In 1939, the development of the tank and of the defense against it kept about even. In armament of antitank weapons, there were used the Hotchkiss 13-mm. and 25-mm.; the Oerlikon (Swiss) 20-mm.; the Rheinmetall (German) 37-mm.; the Bofors (Swedish) 40-mm.; and the 65-mm. anti-aircraft cannon of the Italians, the latter depressed to ground level.

Recognizing the necessity for meeting the challenge of

Above, left: U.S. mobile 155-mm. gun, mounted on a medium-tank chassis. Throwing a 95-lb. shell ten miles, it could knock out any tank in existence

Above, right: "Katiushas," Russian rocket guns shown ranged in batteries as they fired at the Germans before Stalingrad

Left: The M18, new 57 mm. recoilless rifle provided for U.S. infantrymen in 1945. It had the striking power of field artillery and could be handled by one man

Below: The "Crocodile," a British flame-throwing tank with a range of more than 150 yards, was first used against the Germans in France in 1944. It was fitted to a Churchill tank and carried its fuel in an armoured trailer towed by the tank

tanks, the United States, during 1940-41, developed 52 tank destroyer battalions, equipped as: (1) light units with towed weapons assigned to infantry divisions, (2) light units with self-propelled units, usually assigned to cavalry and motorized divisions and (3) heavy units assigned to armoured divisions, army corps and armies. One of these destroyer battalions was mounted on half-tracks and carried 75-mm. guns. Also used against heavy tanks were 18 jeeps and "swamp buggies" along with 10 converted light tanks.

By 1942, the United States led in tank destroyer production. The best unit was built on the General Grant medium tank chassis. This weapon played a decisive part in African operations, knocking out Rommel's 88-mm. anti-aircraft guns. U.S. manufacture also mounted heavier-calibre destroyers on caterpillar half-tracks, 37-mm.; also, all-wheeled Fargo tracks armed with 75-mm., 3-in. high velocity types, and a 105-mm. mount. Germany claimed a 47-mm., self-propelled antitank weapon. However, their 28/20-mm. antitank gun, used in Africa, was an excellent weapon, achieving great penetration for its .80-calibre shell.

In the closing years of the war, the United States brought out 2 very proficient tank destroyers—the M-12, mounting a 155-mm. gun on a medium tank chassis and a 105-mm. howitzer mounted on an M-7 tank chassis.

Other Allied Types.—To the field and siege guns, tanks and antitanks of artillery must be added the mortar. This weapon, shorter, lighter and more mobile than howitzers (with the exception of "Little David") was either smooth-bore or rifled. Trench mortars were used against troops in trenches and foxholes, against machine gun nests, and against road blocks. They could be used for plunging fire to as high an angle as 85°. After 1941, the trend was toward larger calibres. The principal trench mortar types developed were the smooth-bore 60-mm. and 81-mm. The best rifled-bore was the 4.2-in. chemical mortar; for the United States, the Stokes mortar was the best. Almost at the end of the war, the U.S. army developed "Little David," the epitome in mortar construction; this 914-mm. (36¼-in.) giant fired a 3,650-lb. shell a distance of 6 mi. through a 22-ft. muzzle-loading rifled tube. During 1946, there was under test a small mortar, unique in that its loading was accomplished with the assistance of a rocket attached to the nose of the shell. When lit, this rocket drove the shell back from the muzzle to the breech of the mortar to make contact with the firing pin.

Rocket ammunition, or rockets, made rocket launchers necessary. They were of two types—guide rails and guide tubes. Both were fitted with electrical ignition devices to set the rocket in motion and give its flight initial guidance. Rocket launchers were of single and multiple types, stationary or mobile. In the latter case, banks of launchers were mounted on trucks, on aircraft, on tanks and on landing craft covering beach landings.

Axis artillery types opposed to the above weapons follow in brief summary.

German Artillery Weapons.—Howitzers: Light—10.5-cm. (two types); 7.5-cm. (close support infantry weapon); Medium—15-cm. (replaced after 1939 as obsolete); Heavy—15-cm. (high or low trajectory firing); 21-cm. standard weapon; Mountain—7.5-cm. (original Skoda design); 10.5-cm. (improvement upon standard piece of same calibre).

Railway Guns: "Leopard"—28-cm. (mounted on turntable on railway car, range 31 mi.); 20-cm. (used in Calais-to-Dover firing).

Field Guns: Light—7.5-cm. (standard at opening of war, replaced by same calibre of better range). Medium—10-cm. (standard for many years); 15-cm. (K-18) displaced the 10-cm.; 15-cm. (K-39) displaced the K-18. Heavy—15-cm. (became obsolete during World War II and relegated to coast defense); 17-cm. (highly mobile); 21-cm. (stolen from Czechoslovakia). Mountain—7.5-cm. (used first in Tunisian campaign).

Mortars: Light—5-cm. (compact and easily transportable); Spigot—20-cm. (used to destroy mine fields); Heavy—8-cm. (conventional design produced in 1934); 8-cm. (later type, shorter and lighter); 12-cm. (conventional type, modelled from Russian type); Smoke—two types, both 10-cm.

Anti-aircraft: 2-cm. (initial standard weapon); 3-cm. (improvement in vertical range); 4-cm. (Bofors—easily replaced barrel); 5-cm. (gas-operated automatic weapon); 12.8-cm. (with the 8.8-cm. constituted Germany's standard heavy anti-aircraft weapons).

Antitank: 3.7-cm. (early standard German weapon—discarded early in World War II); 5-cm. (introduced in 1941 during campaigns in Greece and Egypt); 4.7-cm. (stolen from Czechs, early discarded); 7.5-cm. (antitank and antipersonnel. This replaced an 1897 French model which Germans had mounted); 7.62-cm. (Russian piece modified by German); 8.8-cm. (3 in this group of heavies, the Pak 43, 43/1, and 43/2). Germans also used 3 tapered bore types—2.8/2.0-cm. (first used in Libya in 1941), 4.2/2.8-cm. (used in European theatre in 1942), and the later 7.5/5.5-cm. model.

Automatic Anti-aircraft and Antitank Guns: 2-cm. (Danish type popular in German navy); 2-cm. (38), usually mounted in fours.

Special Type Guns: 8.8-cm. (highly publicized in African campaigns; really an anti-aircraft weapon); 10.5-cm. (2 types, static and mobile; these were the German standard heavy anti-aircraft weapons).

Recoilless Gun: 7.5-cm. (airborne weapon, actually a short, rifled howitzer); 10.5-cm. (produced in 3 types, L.G. 40, 42 and 42/1).

Tanks: German tank markings were rather complicated. Allied troops recognized the types simply as Mark I, II, III, IV, V. Of the Krupp-manufactured Mark I, there were three types, one produced in 1934, another water-cooled type and a third fitted up as a commander's armoured office. Mark II—six models (A produced in 1937; B and C in 1938, weak frontal armour; D and E built in 1939 and later converted into flame-thrower tanks; F, built in 1941, corrected many of the faults of the earlier tanks). Mark III—14 models (A, B, C, D, E—armed with 3.7-cm. cannon and 2 light machine guns; F, G, H—first to replace 3.7-cm. with 5.0-cm. cannon; J, K—improved by thickening armour from 3.0 to 5.0-cm.; L, M, N, O—revamped to air-cooling system for desert work). Mark IV—10 types (A, B, C, D, E—standard medium tank weighing up to 24 tons; F-1, F-2, G, H, K—armour thickened and heavier gun calibres introduced). Mark V—3 produced in 1937. Latest World War II heavies, Mark VI, were the "Panther," hull and superstructure a single unit, submersible to a depth of 14 ft. 9 in.; the "Tiger," superstructure welded to hull—weight 63 tons. A later model weighed 75 tons. An improved Tiger tank chassis mounted a 38-cm. rocket projector. U.S. bazooka teams repeatedly knocked out German heavy tanks.

Antitank, Self-Propelled: Pak (+)—4.7-cm. antitank gun on Model B tank chassis; Pak 36—German modification of Russian weapon, mounted 7.62-cm. gun; Pak 39—Czech tank chassis, Model 38, with 7.5-cm. gun; Pak 40—produced in 1942 and used in Tunisia, mounted 7.5-cm. gun;

Pak 40/1—German 15-cm. heavy field howitzer mounted on French Lorraine tank chassis; Pak 40/3—7.5-cm. gun on Czech turretless tank chassis; Pak 42—heavy gun mounted on modified Mark IV tank chassis; Pak 43/1—first named "Hornet," later "Rhinoceros." First used in Spain in 1934 as semimobile anti-aircraft gun; improved for battle of France where it knocked out heavy French tanks. This was a very efficient 25-ton weapon. Pak 43/2—"Ferdinand," later known as "Elephant." An 80-ton assembly, the heaviest of German self-propelled antitank guns. Mounted 8.8-cm. gun on special chassis. First used against Russians in 1943; Pak 43/3—heavy gun mounted on standard "Panther" tank chassis. This weapon proved equally effective as an antitank or assault weapon.

Japanese Artillery Weapons—Howitzers: 70-mm.—made in 1932, rifled, single-shot infantry support weapon; 105-mm.—made in 1931, a lighter piece than the U.S. 105; Model 4, 150-mm.—horse-drawn model designed in 1915, superseded by Model 96 in 1936, but used all through World War II.

Field Guns: 37-mm.—developed in 1922, and later improved; still the Japanese used it through World War II; 37-mm. Model 94—developed in 1934 as close support weapon; 75-mm. Model 38 made in 1905—improved in 1930 (Model 90), and again in 1935, but all 3 models kept in service; 75-mm. Model 41—originally pack artillery, it became standard regimental gun; 75-mm. Model 90—developed secretly to be Japanese divisional field artillery weapon. Its distribution was begun in 1936; 105-mm. Model 92—in 1932 it superseded Model 14 of 1925. Designed for long-range fire; 75-mm. Model 49—a mountain gun, built in 1934.

Mortars: 50-mm. Model 98—designed in 1938 to fire stick bombs; 70-mm. Model 11—rifled tube, designed in 1922; 81-mm. Model 97—manufactured in 1937, similar to U.S. 81; 81-mm. Model 99—light, smooth-bore weapon firing particularly heavy shell; 90-mm. Model 94—developed in 1934 with recoil mechanism; 90-mm. Model 97—made in 1937, similar to U.S. Stokes; 320-mm. Spigot—fires 674-pound projectile, more than weight of entire mortar; 150-mm. Model 97—used primarily in fixed emplacements for island defense.

Anti-aircraft and Antitank: 13-mm. Model 93—copy of French Hotchkiss; 20-mm. rifle—developed in 1937 to be handled by two men; 20-mm. cannon, Model 98—could be fired either mounted on wheels or on outriggers; 25-mm. cannon—made for naval service; 75-mm. Model 88—designed in 1928, capable of quick emplacement.

Tanks: Light—Model 2592, built in 1932, used in China for reconnaissance tasks; Model 2593, built in 1933, converted to amphibious type; Model 2594, built in 1934 and used as a prime mover; Model 2595, built in 1935 and succeeded in 1937 by Model 2597 which eliminated many previous faults. Light tanks mounted 7.7-mm. machine guns. Medium—Model 2589-A, built in 1929 using World War I Whippets and Vickers as models; Model 2589-B, improvement on "A" type and provided better mounting for gun; Model 2594, modification of 2589 and used extensively in China; Model 2597, produced in 1937 it incorporated best features of light tanks; Model 2597 Special, improvement on preceding model. First used in 1942.

Small Arms.—These are weapons 0.60 inches or under in calibre, used primarily by infantry, carried and operated usually by one or two men. The term includes rifles, pistols, carbines, machine guns and submachine guns.

Semiautomatic Rifles.—Experiences of World War II defined four semiautomatic rifles for standard issue. They were (1) The U.S.M1 (Garand). By 1945 it was the stand-

ard U.S. rifle. The Springfield M1903A4 was also used for sniper work. The Garand was adopted in 1936. (2) The Johnson M1941, developed from 1936 to 1940 and adopted by the Netherlands. (3) The Gewehr 41, 41M, 41W, and 43. Germans began to adapt semiautomatic principles to the infantry rifle only in 1941, bringing out the first three Gewehr models here listed in that year. The 43 model, developed between 1942–45, represented the best produced in this class. (4) Simonov M1936, Russia's first semiautomatic shoulder rifle. Some of its features were copied by the Japanese in their Type 96 and 99 LMG. The Simonov was replaced in Russia by the Tokarev M1938 and M1940. The Italians in the Ethiopian campaigns and in the European theatre used a Czechoslovakian semiautomatic rifle. Of the above, the Garand and Johnson used .30-calibre ammunition, the Gewehr used 7.9-mm. cartridge and the Tokarev, 7.62-mm., the latter two both being smaller than the U.S. types.

Submachine Guns.—Known in Great Britain as machine carbines and in Germany as machine pistols, these were used extensively in World War II as close-range weapons, and were intended to give heavy fire support to advanced infantry units. U.S. models fired the .45-calibre Colt automatic pistol cartridge. European models, with the exception of Russia, used the 9-mm. Luger cartridge. Russia used a 7.63-mm. Mauser cartridge.

In the United States the familiar "tommy gun" led the series. The types were M1921A, the M1928 and the M1928A1. The British were furnished thousands of this latter model. The Thompson submachine gun M1 was a modification of the original model and was intended for U.S. issue. It was quickly followed during World War II by the M2 and M3.

Another important submachine gun was invented by Eugene Reising; three types of the H and R Reising submachine gun were brought out and manufactured for World War II—the M50, M55 and M60. The 55 was a paratrooper model. Three other types of submachine guns were manufactured in the United States and used in World War II—the Sedgley, the Smith and Wesson light rifle M1940, and the United Defense gun. The two latter types were furnished broadly to U.S. Allies. British types of this class of weapon were the Sten Mark I, II, III and V; the Lanchester MK I; the Austen Mark I and II; and the Owen Mark I and II. German types were: the Bergmann M1934; the machine pistol M18-1; the Steyr Solothurn SI-100; the Schmeisser MP38/40; and the Erma MP. Russian designs followed the German Bergmann pattern. They were known as M1934/1938, the M/1940 and the PP SH-41. The Italians employed two types, the Italian Beretta and the Beretta Moschetti.

Carbines.—The United States probably led the world in developing the carbine. Its tests in 1941 brought the M1, which was subsequently modified into types M1A1, the M1A5, the M1A4 and the M2, the latter adopted in 1944, and the finest weapon in its class. A model developed by Howard R. Clarke was under test in 1946 and was particularly notable for simple and compact design. Axis weapons in this class were the German types KAR44 and the Volksturm carbine M45, the latter developed in the final months of the war and little used.

Machine Guns.—In the United States most of the types used were designed by John M. Browning, who also designed most of the Colt automatic pistols. The heavy machine gun predominated in World War I; the light, in World War II. It went everywhere that troops went. Types

were: the Lewis M1915, adopted also by the British and exactly copied by the Japanese; the Browning M1918 (B.A.R.), used extensively by several nations in World War II. It was modified and widely used by the United States in World War II as Model B.A.R. M1918A2. Another model, not as widely used, was the Browning M1919A6. The Johnson M1941 was developed by experimentation into the M1944/1945 and furnished a much higher cyclic rate of fire than its predecessor. In Europe, the standard light machine guns for Great Britain in World War II were the Bren gun and the Czech ZB. Both of these were copied by the Japanese. The British also used a variation of the Bren, known as the Vickers-Berthier. The Germans entered World War II with the Dreyse-Solothurn MG34 as their light machine gun weapon. This was later improved and known as the MG42. The Germans also developed a very lightweight machine gun known as the Fallschirmjaeger Gewehr 42/44, designed for paratroopers' use. The best Japanese weapons in this class were the Type 96 and 99, which replaced the 1922 version of the Nambu, a Hotchkiss weapon. A late Russian light machine gun was the Dektyarov, whose initial faults were corrected after its performance in the Spanish Civil War had been observed.

Pistols.—Pistols had two uses, as a personal weapon and as a means of firing signal cartridges. For the latter purpose, the Allies rather generally used the Very pistol; the Germans used two Walther types, both 27-mm. calibre, one single and the other double-barrelled; the Japanese used a heavier, 35-mm. calibre weapon for this purpose. As a personal weapon, the U.S. Colt automatic .45-calibre was in a class by itself for accuracy and striking power. The Japanese used a Model 14, Nambu 8-mm. pistol, closely resembling the German Luger; they also had a "Baby Nambu" firing a 7-mm. calibre cartridge. An example of the latter type did not fall into Allied hands until the closing months of the war. The Germans, at the outset of World War II, used a Luger 9-mm. sometimes referred to as the "parabellum." The Walther pistol "P-38" superseded the Luger as their sidearm.

Ammunition.—Small Arms.—For military use, classes of small arms ammunition were rather limited. During World War II, the common ball type of ammunition was little used, its place being taken by armour-piercing (AP) types which could be used equally well against personnel and aircraft; API ammunition was fired to start conflagrations; API-T, in addition to setting fire to its target, left a tracer streak of fire and smoke. Tracer cartridges were also loaded singly as well as in combination. Calibres of these types

of ammunition were .30 for carbines, rifles and machine guns, .45 for pistols and submachine guns, .50 and .60 for machine guns used in aircraft or anti-aircraft.

Artillery Ammunition—Projectiles: The calibres of projectiles were, of course, determined by the bore of the weapon. Principal types of projectiles were recognized by shape, purpose and by filler employed. *High-explosive* artillery ammunition had usually one of two purposes, (1) to demolish matériel or (2) fragmentation, to kill personnel. *Chemical shell* might include solid, gaseous or liquid filling. The same types of filler were also found in bombs, grenades and rockets. Smoke-producing agents were also loaded into chemical shells. *Armour-piercing projectiles* had to be produced in accompanying ratio to the thickening of armour on tanks, aircraft and armoured vehicles. Most armour-piercing shells carried tracer inserts. High-explosive shells were of necessity fused, as opposed to armour-piercing. Even the smaller calibres, .20- and 40-mm., were made in both high-explosive and solid shot patterns. *Mortar projectiles* were lighter in construction than artillery projectiles. Principal types of mortar projectiles used were high-explosive, chemical, smoke and illuminating. By shapes there were two mortar shells—the "tear drop" used in 60-, 81-, 105-, and 155-mm. mortars; the "cylindrical" used only in the rifled 81-mm.

Illuminating shells served the purpose indicated by their name. Battlefields were lit brightly by burning magnesium flares floating from parachutes contained in illuminating shells which had been fired either to light an objective or convey a signal. Very pistol cartridges also discharged coloured light signals into the skies. Some shells were known as "propaganda projectiles" since their burst loosed countless printed leaflets to flood enemy terrain.

Grenades.—Hand, potato masher, rifle, incendiary were the chief types. The rifle grenade was used against tanks and armoured vehicles, and for incendiary, booby trap, demolition, smoke and signal purposes. The hand type depended on fragmentation for its value as an antipersonnel weapon.

Mines.—These included land mines, antitank (HE) mines, antipersonnel mines, beach mines, booby trap mines. A notable antipersonnel mine was the "Bouncing Betty," which first rose a few feet into the air and then scattered death-dealing shrapnel in a circle about it.

Miscellaneous Munitions Items.—It is only possible here to indicate briefly some of the many tools of war not previously mentioned.

The Guerlich, a highly efficient 1-in. German antitank gun, firing shells at the extremely high velocity of 4,750 ft. per second by compressing them in a tapered barrel. A British soldier is demonstrating this captured Guerlich

Bombs.—The two principal types were demolition and incendiary. A third type was the chemically-filled bomb. The demolition types varied from the 100-lb. size to the British "volcano," weighing 22,000 lb. The term "block-buster" as applied to these heavy bombs was truly descriptive. The incendiary bombs, dropped singly or in clusters, burned out populated areas all over Germany. Filled with chemicals which clung to whatever they set on fire, their efficiency record was written in the record of hundreds of German-populated areas scorched from the face of the earth. Their counterpart in land warfare was the flame thrower, whose searing jelly consumed everything it touched. The bomb was particularly an aeroplane weapon. However, the buzz bombs and robombs with which the Germans raked British cities were jet-propelled, and their flight was regulated by an automatic timing device which eventually tipped the robot into a 60° dive. In naval aviation the depth bomb released from a plane accounted for the destruction of many submarines. Single Napalm fire bombs could create destructive fires over 30,000 sq. ft. of territory. The U.S. navy had three efficient, modern types of bombs: the "Glomb," 4,000 lb., a pilotless glider; the "Gorgon," 1,000 lb. a jet-propelled missile carried by a bomber plane and guided to its target by radio, attaining a speed of 550 m.p.h.; the "Gargoyle," a 1,000 lb. jet-propelled bomb which traveled at 600 m.p.h. The U.S. army had the "Azon," a 1,000 lb. bomb having gyro and radio control for azimuth, and the "Razon," which could be controlled in range as well as in azimuth. (See also CHEMICAL WARFARE; INCENDIARY WARFARE; JET PROPULSION.)

The acme of bomb construction and performance was, of course, the atom bomb, which, by its destruction of Hiroshima and Nagasaki, definitely hastened the end of the war. Tests in the Bikini atoll during the summer of 1946 were expected to determine the future use of this weapon. (See also ATOMIC BOMB.)

Rockets.—Originally pyrotechnic weapons for signalling, rockets underwent an evolution that finally saw the German V-2 rocket emerge as a powerful weapon of destruction. This was really a rocket bomb. Its warhead contained a ton of explosives and, shot from concrete ramps, reached a height of 20 mi. from the earth before it began to arc. At the zenith of the arc, the bomb was 55 mi. from the earth and was traveling at a speed of 5,000 ft. per second. Many of these bombs were recovered by U.S. forces, along with a few of the German V-3 type. Taken back to the United States, they were thoroughly tested. In July 1946 one V-2 bomb rose in Arizona to a peak height of 104 mi. before turning earthward.

The bazooka shell was a true rocket, and its tremendous striking power enabled an infantryman to stand alone to challenge, and often vanquish, a tank. (See also ROCKETS.)

Proximity Fuse.—Bombs and projectiles alike owed a major portion of their efficiency quotient to an invention which definitely hastened the end of the war—the proximity fuse. This consisted of a small, rugged radio transmitter and receiver, about the size of a man's fist. Placed in a bomb or projectile, it sent out high-frequency radio waves which caused detonation of an explosive charge when the waves bounced back from enemy aircraft, vehicles or the earth itself. To produce power for this minute radio there was perfected a generator, motivated by a small windmill propeller and recessed in the nose of the propeller. This windmill generator was no longer than a watch, but, at 100,000 r.p.m. supplied enough power to create continuous emanation of radio waves from the bomb or the pro-

Cross section of a radio proximity (VT) fuse developed in the U.S. and first revealed on Sept. 20, 1945. The fuse, containing a radio transmitter and receiver, was fitted into the nose of a projectile. When the projectile was fired, the transmitter sent out a continuous wave. As it moved within effective range of a target, part of the wave was reflected back to the receiver, and an electronic device exploded the missile

The German mobile 88-mm. gun, one of the most publicized guns of World War II, used with considerable effect against British tanks in the Libyan desert

jectile fitted with the proximity fuse. (See also RADAR.)

Explosives.—The following listing covers the principal explosives used during World War II: (1) lead azide, most sensitive of modern military explosives. It replaced mercury fulminate. (2) Petn (pentaerythrite tetranitrate). (3) T.N.T. (trinitrotoluene). (4) Tetryl, used in small-calibre projectiles. (5) Tetrytol, used in bombs, in chemical and smoke shells. (6) Cyclonite, used primarily with other explosives to form mixtures, principally the various RDX types. (7) RDX-A, cyclonite, T.N.T., and wax mixed; RDX-C, cyclonite plus plasticizer, a plastic explosive much used in bombs. (8) Amatol, in varying percentages, a mixture of T.N.T. and ammonium nitrate.

Munitions Auxiliaries.—This field is extremely broad. A few examples of World War II are given below:

Norden Bombsight.—One of the reasons for the superiority of U.S. aeroplane bombing.

Around-the-Corner Gun.—Claimed by the Germans as their innovation. A patent covering it was placed on file in the U.S. patent office, dated 1916.

Bangalore Torpedo.—Used to clear away barbed wire, to jam caterpillar tank treads, destroy railway tracks and as a component of booby traps.

Jeep.—An all-purpose motor vehicle.

Duck.—An amphibious $2\frac{1}{2}$ -ton truck.

Walkie-Talkie.—A radio set light enough to be carried anywhere. Operated as easily as a telephone handset. Followed by the Handie-Talkie.

Mats.—Steel; perfected to facilitate beach landings of heavy equipment.

Armour.—Body; developed to protect aviators from neck to hips.

Helmets.—New antiflak types developed.

Murphy, Frank

Murphy (1893–), U.S. jurist, was born April 13, 1893, at Harbor Beach, Mich. He received his B.A. and LL.B. degrees at the University of Michigan and continued graduate study at Lincoln's Inn, London, and at Trinity college in Dublin. He practised law in Detroit, Mich., from 1916 until the United States entered World War I, when he went to France as a first lieutenant and later as captain of infantry. After his discharge from the army of occupation in Germany in 1919, he returned to Detroit and was appointed chief assistant to the U.S. attorney for the eastern district of Michigan. From 1923 to 1930 he was judge of the recorder's (criminal) court in Detroit, and in 1930 he was elected mayor of the city. Re-elected in 1932, he resigned in May 1933 to accept appointment as governor general of the Philippines. Reputedly at the suggestion of President Roosevelt, he ran for governor of Michigan in 1936 and was elected. In 1938 he was defeated for reelection by Frank D. Fitzgerald. Roosevelt then named him U.S. attorney general on Jan. 2, 1939. One year later President Roosevelt named Murphy associate justice of the supreme court to succeed Pierce Butler (1866–1939). After a brief leave of absence from the court from June to Sept. 1942, when he served in the army as lieutenant colonel, he resumed his post on the court bench.

Murphy, Robert Daniel

Murphy (1894–), U.S. diplomat, was born Oct. 28, 1894, in Milwaukee, Wis. He entered the U.S. foreign service in 1917 as a clerk in the Berne legation, and held consular posts in Zurich, Munich and Seville until 1930, when he was transferred to the Paris embassy as consul and later as first secretary. After the collapse of French armies in June 1940, he followed the Pétain government to Vichy, becoming a counsellor in the U.S. embassy and chief U.S.

representative in French North Africa. Murphy was credited with having played an important role in preparing the groundwork for the U.S. invasion of French North Africa in Nov. 1942. For this work he was given the D.S.M. and was raised to the rank of minister. During the early part of 1943, he was the centre of a storm of criticism from the U.S. for his alleged co-operation with Vichy. When the advisory council to the Allied control commission for Italy was formed in Nov., Murphy was appointed as the U.S. member with the rank of personal ambassador. In Aug. 1944 he was made political adviser to Gen. Eisenhower, to help set up and operate the machinery for the Allied military government of the reich. During the occupation of Germany in 1945 and 1946, Murphy was again criticized in the U.S. and was charged with excessive leniency towards former nazis in the civil administration.

Murray, Philip

Murray (1886–), U.S. labour leader, was born in Blantyre, Scotland, on May 25, 1886, and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, and international vice-president in 1920. In 1935 he was named to the National Industrial Recovery board and to the advisory council of the National Recovery administration. The same year he helped lead the Committee for Industrial Organization out of the American Federation of Labor, and in 1936 he directed the steel workers' organizing committee of the C.I.O. Murray, the choice of John L. Lewis, succeeded the latter as C.I.O. president on Nov. 22, 1940, when Lewis fulfilled his pledge to resign if President Roosevelt were re-elected. But Murray did not share Lewis' bitter opposition to Roosevelt's foreign policy. A split developed in May 1942 when Lewis removed Murray as vice-president of the United Mine Workers. Murray, with the support of the C.I.O., fought back, and Lewis withdrew his union. In 1943, Murray urged a program including the no-strike pledge, more efficient use of manpower, reform of the War Labor board, a more progressive taxation policy and the stabilization of prices. When congress ignored these proposals and instead enacted the Smith-Connally anti-strike bill, the C.I.O. established a Political Action committee which supported President Roosevelt for re-election in 1944.

Immediately following the conclusion of World War II, the C.I.O., under Murray's guidance, launched its campaign for continued high wages, a broader social security program and an adequate full employment bill.

Music

No previous decade in the history of music was more interesting from the standpoint of the interrelationship of art to the political and economic life of peoples than the ten years from 1937 to 1946. While one could very easily discuss this period from the standpoint of great creative figures—for this period produced great music—the discussion would miss the main point of the times. Almost no artist, of whatever nationality, of whatever disposition—conservative or radical—failed to feel the impact of great political and economic forces.

The 20th century had witnessed the struggle of composers against the Romantic-Germanic idea of the creative artist as "hero-philosopher" whose music had profound meaning, just as the early 19th century saw the struggle

against the Baroque-Italian conception of music as *bel canto*—the elegance and refinement of formalization. In rapid succession composers of the 20th century had experimented with impressionism, with primitivism, with abstractness of sound: Alexander Scriabin and Claude Debussy concerned themselves, in very different ways, with musical colour; Igor Stravinsky with primitive rhythm; Arnold Schoenberg with the abstract formulation of musical sound. These ideas of revolt against what seemed sentimental and confining in the aesthetics of the 19th century produced great music, but more often than not, music which had a very limited appeal to the lay audience. No experiment made during the first three decades of the 20th century had given the public the kind of serious music it demanded.

Actually, the cleavage between the tastes of the creative artist and the public had widened.

The aesthetic dilemma was felt in all western countries, and various solutions were suggested. The reactionary solution—to turn back to the Romantic-Germanic ideal with all its sentimentality and pompousness—was decreed, perhaps inevitably, by the Reich Music Chamber organized in Feb. 1936. By government propaganda, also, soviet Russia tried with considerable success to force the creative artist to abandon "petty bourgeois leftist tendencies" which made his art unintelligible to the masses of people. The blast of criticism during Feb. 1936 against Dmitri Shostakovich's opera *Lady Macbeth of Mtsensk* and his ballet *The Limpid Stream* indicated the Russian method of dealing with this aesthetic problem. While the government of the United States of America did not attempt to interfere with the composer's style, the people, by their indifference or their outspoken reaction to modern music, did. The composer in western society, even before the outbreak of World War II, was forced to consider more and more frequently the relation of his art to his audience. Possibly the central characteristic of art during the 20th century would be its social responsibility, as individualism was the "zeitgeist" of the 19th century and elegant formalism the inspiration of the 18th.

The economic depression of the '30s brought about in the United States the first great social experiment in the arts. The Federal Music Project of Work Projects Administration necessarily concerned itself with the tastes of the U.S. public. In 1936, 116,302 performances were given to an audience of 85,418,314 people. The Composer's Forum-Laboratory inaugurated in New York city in Oct. 1935 and extended during 1936 to several other cities of the country gave the U.S. composer a direct contact with the public. Composers were certainly not made by this experiment, but the style of their music was. With the liquidation of WPA in 1943 the process of governmental action had for the moment stopped in the United States, but many ideas derived from that experiment were carried over into private institutions and local communities. William Schuman, president of the Juilliard School of Music of New York city, indicated the extent to which new elements had moved into the control of old reactionary institutions. He wrote in the catalogue for the academic year 1946-47: "It is not enough that the musician be content with technical proficiency alone. He must be equipped to contribute, through his profession, to the development of music as a constructive force in contemporary life."

Whatever one might think of governmental control of the creative artist, there was no doubt that in the soviet union there had developed a vigorous school of composers.

While a few Russian composers already associated with western European culture, like Igor Stravinsky, had exiled themselves from the U.S.S.R., the larger group, including men like Reinhold Glière and Nikolai Miaskovsky, joined forces with the younger composers to develop a new soviet music. Serge Prokofieff returned to Russia, in fact, after a considerable period of exile. Shostakovich's fifth, sixth, seventh, eighth and ninth symphonies belong to the period. Prokofieff's *Fifth Symphony*, *Peter and the Wolf*, his beautiful *Seventh Piano Sonata*, not to mention his operatic works, belong also to this decade. Other names such as Aram Khatchaturian, Ivan Dzerzhinsky, Tokhan Khrennikov, Michael Gnessin and Dmitri Kabalevsky were coming more and more to be heard.

The actions of the Reich Music Chamber were much more oppressive to the creative artist. The "aryanization" of all music inevitably drove many of the finest German composers into exile, and with the German invasion of each new European country the group increased. Paul Hindemith and Schoenberg were the two greatest figures that left Germany. Richard Strauss remained the only great figure to espouse nazi aesthetics. The reactionary and nostalgic attempt to recapture the spirit of Richard Wagner stifled a living art. The most desperate attempts of the reich propaganda ministry to encourage works that possessed "creative and directive value for the future" could not make Werner Egk's *Die Zaubergeige*, produced in Berlin Feb. 15, 1936, or *Peer Gynt*, produced in Dec. 1939, into great music. There was some question, however, whether the nazi ideas about musical style sprang from the people. Certainly they did not spring from the people of occupied countries. Exhibitions of "decadent music," such as the reich Music Week festival at Duesseldorf May 22-29, 1938, were embarrassingly successful. These exhibitions, especially in Vienna, were closed when it became obvious that the recordings of such music were being listened to for enjoyment rather than criticism.

Perhaps no decade had seen so many musicians exiled from their native homes. Not only Jewish artists, but many other musicians who could not approve of the nazi persecutions, left Germany. Hindemith moved to Turkey and finally to the United States, where he became professor of composition at Yale university. The great musicologist, Dr. Alfred Einstein, moved first to Italy and finally accepted a chair at Smith college in Northampton, Massachusetts. Switzerland became the refuge for many. The number of exiled artists who migrated to the Americas was so great that it influenced profoundly the musical life and growth of the new world.

* * *

DURING THE DECADE it can be said that U.S. music came of age. At various times in the history of the United States there had been influxes of exiled European artists. The French Revolution bathed U.S. culture with French influences. The revolutions of 1848 staggered the slowly maturing U.S. music with Germanic influences. Each time these foreign influences had been painfully absorbed, leaving U.S. culture the richer. During the decade 1937-46, the effect of U.S. tastes upon the exiled European artist was almost as great as the reverse influence. The absorption of modern European ideas was, as a result, less upsetting to the U.S. musician. Indeed, the productivity of the U.S. composer during the ten years was enormous. The European composer greatly stimulated rather than depressed the musical life of the United States.

It was natural, perhaps, that the exiled composer should show the least interest in the social-aesthetic problem which dominated the times. Men like Hindemith, Schoenberg, Stravinsky, Béla Bartók and Darius Milhaud, all living in the United States, were mature artists whose aesthetic beliefs sprang from earlier decades of the century. Nevertheless, it would be misleading to suppose that these great men showed no sympathy to the problems of the time. Paul Hindemith's opera *Mathis der Maler*, based on the life of the great German painter who joined the futile revolt of the peasants against the ruling nobles, was produced in Zurich, Switzerland, in Nov. 1938. This opera, and especially the symphonic work derived from it, showed Hindemith in a new light. He spoke a persuasive emotional language understood by audiences. There was a new relationship between dissonance and consonance that became more and more apparent in his later style. Arnold Schoenberg's work showed less change. There were, however, such important scores as the *Fourth String Quartet* (Los Angeles, Jan. 9, 1937), a *Violin Concerto* (Philadelphia, Dec. 7, 1940) and, celebrating his 70th birthday in 1945, a *Piano Concerto* and *Ode to Napoleon*. Stravinsky had always been a figure of great stylistic changes. His *Duo for Violin and Piano* showed an unexpected lyricism. His other work produced during the decade included: a *Symphony in C* (1941), *Dances Concertantes* (1943), and *Sonata for Two Pianos* (1946). The mysticism of Béla Bartók's last works (he died Sept. 29, 1945, in New York city) made this composer a little less severe to audiences. Even "twelve-tone" music was given emotional meaning in the *Violin Concerto* of Alban Berg, performed in Barcelona, Spain, in 1936, performed and recorded in the United States during the years that followed. This composer died in Vienna in 1937. His opera *Lulu* was performed posthumously in Zurich, Switzerland, June 2, 1937.

In spite of (or, perhaps, because of) the important production of European composers living in the United States, the native U.S. composer flourished; indeed, he flourished to such an extent that no brief account of the period could do justice to what was in fact a renaissance of music in the United States. Figures whose names were known during the '20s, such as Aaron Copland, Roger Sessions, Roy Harris, Howard Hanson, to mention only a few, all produced their most important works between 1937 and 1946. Aaron Copland's works for ballet and cinema brought him special attention. Roger Sessions' *String Quartet* (1937) showed again this composer's musical integrity. Roy Harris' *Third Symphony* (1939)—one of four written during these years—had a popular appeal. Howard Hanson's *Third Symphony* (1946) again showed this composer's mastery of the orchestra. There were also young figures who became known during the decade: Walter Piston, William Schuman, Samuel Barber, David Diamond, Nicolai Berezowsky, Lukas Foss and the young composer-conductor, Leonard Bernstein, and many others of almost equal importance. Nor could one justly ignore the production of older men like Frederick Jacobi, Louis Gruenberg, John Alden Carpenter and E. D. Hill—to name only a few who continued to give breadth to the fine diversity of U.S. musical culture.

The need for a greater rapport between composer and public was strongly felt in the United States. Composers began to realize how persuasively the U.S. people throughout their history had demanded the social integration of art. *Les belles arts* had no place in pioneer society. Americans, for better or worse, had refused to support a sophisticated art. Music had flourished when it associated itself with the process of living—with religion, social conflicts, political and economic events, play, the theatre, etc. The

serious composer in his effort to ally himself with the deep currents of U.S. thought often tapped the abundant folk music. Few U.S. composers totally ignored this source of inspiration. (See *FOLKLORE, AMERICAN*.) Others felt that contact with the radio or the cinema or the theatre offered a more direct composer-audience relation.

There were few composers like Roger Sessions who held aloof completely from the popular elements of art in their country.

* * *

THE MOST sensational work of the decade was Shostakovich's *Seventh Symphony*, written while the composer was serving as a fire fighter in beleaguered Leningrad. This work, begun in July 1941, was finished in Kuibyshev the following Dec. 27. It was first performed in Moscow March 1, 1942, in London June 29, and in the United States July 19. Its 73 minutes of music was given over to graphic description of war, to which the Allied nations spontaneously responded.

Prokofieff then began work on an opera based on Leo Tolstoy's *War and Peace*.

U.S. composers too were responding to patriotic demands. Aaron Copland produced his *Lincoln Portrait* in 1943, Earl Robinson turned out a series of patriotic radio works, demanding that "songs can be bullets." Randall Thompson set the writings of Thomas Jefferson to music. Samuel Barber wrote a symphony dedicated to and inspired by the air force. William Schuman wrote *A Free Song* to Walt Whitman texts and *Prayer—1943*. William Grant Still wrote *In Memoriam: The Colored Soldiers Who Died for Democracy*. Ross Lee Finney composed *Symphony Communiqué* and *Pole Star for This Year*, setting to music words by Archibald MacLeish. Roy Harris in the dedication of his *Fifth Symphony* explained his intention "to express qualities of our people . . . heroic strength, determination, will to struggle, faith in our destiny." The vitality of young composers was shown by the works they turned out while members of the armed services. Marc Blitzstein, Hugo Weisgall, John Ward, John Verral, Edward Cone and John Lessard composed symphonic works while overseas.

These works, expressing the foment of the times, might not be as important as others composed at greater leisure, but they reflected the concern of composers to find a closer relation between art and life.

The spirit of the time was also reflected by the Committee on Cultural Relations with Latin America. In 1937 this committee awarded a prize to Jacobo Ficher of Buenos Aires, Argentina, for his *Septima*. A festival of chamber music, sponsored by the Elizabeth Sprague Coolidge foundation was held in Mexico City. Roger Sessions' *String Quartet* was given its first performance on this occasion. The year 1940 saw the greatest inter-American activity. Arturo Toscanini gave 16 concerts with the NBC Symphony orchestra in Brazil, Uruguay and Argentina. Leopold Stokowski toured the same South American countries with an All-American Youth orchestra sponsored by the National Youth administration. At the same time prominent South American composers and performers visited the United States.

Music festivals were considerably affected by the restrictions on travel and communications during the war years. The International Society of Contemporary Music met in Paris in 1937 in conjunction with the Paris exposition, which sponsored many musical events, particularly

Ignace Paderewski playing at Chicago during his farewell concert tour in 1939

the German festival conducted by Wilhelm Furtwaengler and Clemens Krauss. In 1938 the I.S.C.M. met in London; in 1939 in Lucerne, Switzerland; and in 1940 in Warsaw. With the outbreak of war in Europe these festivals were moved to the United States, with a meeting in New York city in 1941 and one in Berkeley, Calif., in 1942. In 1943, however, the plans for a festival in Los Angeles, Calif., were abandoned because of transportation restrictions. The Salzburg and Bayreuth festivals changed from international occasions during the '30s to local German events sponsored by the "Strength Through Joy" organization for the soldiers and factory workers of the reich. The May festival continued in Florence, Italy, throughout most of the war. Two new operas by Francesco Malipiero were presented in Italy during the decade: *Antonio e Cleopatra* (May 4, 1939, in Florence), and *Ecuba* (Jan. 13, 1941, in Rome). Other Italian operas first performed were Ottorino Respighi's *Lucrezia* (Feb. 24, 1937, in Milan), Alfredo Casella's *Il Deserto Tentato* (1937, Florence), Vito Frazzi's *Il Re Lear* (1939, Florence), and Luigi Dallapiccola's *Vol de Nuit* (1940, Florence). While the Covent Garden opera season was interrupted in London during the war, Sadler's Wells productions continued throughout.

In the United States the Berkshire festival, after several brilliant seasons, was cancelled in 1943 and not resumed until 1946.

Music contributed to war-tormented populations of Europe one of the most welcomed releases. In France and the Low Countries any concert which was free from the taint of German propaganda control could be sure of a sold-out house. In small towns in England people crowded to hear chamber music. Small musical groups in Vienna expressed their protest by performing *Entartete Kunst*. Even the Vienna opera performed Rudolph Wagner-Regeny's *Johanna Balk*, causing a political-cultural scandal. Josef Goebbels personally issued a ban on performances of this work and tightened the Nazi grip on musical affairs in Vienna. Young composers and performers in Brussels, Belgium, joined to give emphasis to their national music and succeeded by various devices in continuing throughout the war their protest of German cultural domination.

After the end of the war in 1945 there was a great revival of music in Europe. In spite of the cold, concert halls and theatres were crowded. New figures arose whose work belonged to the future, and exiled composers returned to their homeland. In France the resistance composer Olivier Messiaen and his group of pupils at the National conservatory attracted interest. In England a new opera, *Peter Grimes*, placed Benjamin Britten at the head of English music. Bohuslav Martinů, after five years in the United States, returned to Prague to head the State conservatory, as Anton Dvořák did 50 years ago. Toscanini returned to conduct the La Scala productions in Milan, Italy.

(R. L. Fy.)

Popular Music.—During the ten eventful years from 1937 to 1946 popular music reflected much of the spirit of the time. There were spectacular surprises, incredible banalities and worthy achievements, with an occasional bit of successful nonsense and an adequate adherence to the accepted traditions of a generally conservative business. There was even a private war, between radio and the American Society of Composers, Authors and Publishers (A.S.C.A.P.), during which the public, as usual, was the chief sufferer.

In the hands of a few men, such as Jerome Kern, Richard Rodgers, Cole Porter, Irving Berlin and Sigmund Romberg, popular music actually established itself as a significant art form, with further co-operation from such serious musicians as Vernon Duke (Vladimir Dukelsky), Morton Gould, Leonard Bernstein, Kurt Weill and Robert Russell Bennett. The arrangers of popular tunes often proved more important than the composers themselves, and in many cases these anonymous individuals were clearly the better musicians. The value of words was also emphasized by the work of outstanding lyricists like Oscar Hammerstein II, Johnny Mercer and Ira Gershwin.

Radio's "Hit Parade" and the columns of *Variety*, could be accepted as fairly accurate indices to popular taste in music, and this brief summary of ten years of tunefulness is chiefly indebted to those two sources of information, supplemented by some personal observation and a modicum of professional advice and opinion.

The year 1937 was not distinguished in the field of popular music. There were a few good tunes, with a commendable tendency to revive authentic U.S. folk music, but nothing either commercially sensational or aesthetically admirable. The two biggest sellers of Tin Pan Alley were an arrangement of the bugle pattern called "When My Dreamboat Comes Home" and Billy Hill's "Chapel in the Moonlight," rhythmically indebted to Franz Lehar's "My Little Nest of Heavenly Blue."

The novelty song of the year was "The Merry-Go-Round Broke Down," with obvious opportunities for imitative

realism. The only "production number" to finish among the first 15 was "Little Old Lady," by Hoagy Carmichael and Stanley Adams, which appeared in the musical comedy *At Home Abroad*. The screen popularized three songs, "September in the Rain," "Moonlight and Shadows" and "That Old Feeling," besides awarding an "Oscar" to "Sweet Leilani," which its composer, Harry Owens, had been promoting successfully in Hawaii for at least two years. Of the remaining best sellers of 1937 even the titles soon were hard to remember. The list included "Boo Hoo," "It Looks Like Rain," "Sailboat in the Moonlight," "So Rare," "Harbor Lights" (an English song), "My Cabin of Dreams," "You Can't Stop Me from Dreaming" and "Once in a While." Rudy Vallee's persistence finally brought success to "Vieni, Vieni," adapted from an Italian folk song, with echoes of Giuseppe Verdi's "La Donna e Mobile," while "Serenade in the Night" also profited by an Italian background.

Dances like the "Big Apple" reflected the growing interest in folk materials, and the actual steps drew more and more away from the conventional ballroom technique. Just before the end of the year, a record by the Andrews sisters brought sudden popularity to the Jewish "Bei mir bist du Schoen," which its composer, Sholom Secunda, reputedly sold outright for \$15.

The radio columnist, Nick Kenny, had a hand in two of the big hits of 1938, with his "Gold Mine in the Sky" outselling all other sheet music of the year. This deliberately "corny" song, based on Stephen Foster, was curiously ignored by the "Hit Parade." Later the Kenny brothers hit the bull's-eye of sales once more with their "Cathedral in the Pines," also less prominent in radio than on the dealers' counters.

The two best songs of the year were probably "Love Walked In," by George Gershwin, posthumously published and promoted, and "Thanks for the Memory," whose composer, Ralph Rainger, was marked for untimely death, in a plane accident. Larry Clinton made a popular song out of Claude Debussy's "Reverie," by simply prefacing the word "My" and spelling it "Revery," thereby setting the stage for a long series of adaptations from the classics. The school of nonsense was represented in 1938 by Maria Grever's "Ti Pi Tin" (whose tune was unashamedly borrowed from the Spanish music of Edouard Lalo and Emmanuel Chabrier) and a swing arrangement of the old nursery rhyme, "A Tisket, a Tasket," for whose success the singer, Ella Fitzgerald, was largely responsible. There were also such inanities as the "Dipsy Doodle" and "Flat-Foot Floogey with the Floy Floy," whose cryptic syllabification obviously appealed to a large public.

The chief revival of the year was Irving Berlin's "Alexander's Ragtime Band," which came back forcibly through the motion picture of the same name. There was a strong reminder of Gershwin's "Tell Me More" in Burton Lane's "Says My Heart," although the parallel actually lay in the scale itself. Other hits were "Music, Maestro, Please," a midsummer sensation, and the Burke-Monaco "I've Got a Pocketful of Dreams."

Larry Clinton's demonstration of the permanent appeal in melodious classics carried on into 1939, with "My Revery" followed by "Our Love," whose tune came right out of Tchaikovsky's *Romeo and Juliet* overture. André Kostelanetz forgot his indignation long enough to turn the same Russian composer's *Fifth Symphony* (the slow theme) into "Moon Love." There was an echo of Maurice Ravel's "Pavane for a Dead Infanta" in "The

Lamp is Low," for which Bert Shefter was the entrepreneur, and Raymond Scott gave new popularity to Mozart's *Piano Sonata in C* by simply calling it "In an Eighteenth Century Drawing Room" and playing it as a fox trot.

The most popular song of 1939 was unquestionably "Beer Barrel Polka," based upon a Czech song and destined to become the outstanding hit of World War II. It was the first song in some time to pass the 500,000 mark in sales of sheet music. Second place in the "Hit Parade" was won by a nostalgic ditty called "South of the Border," which profited by some fairly obvious parodies. In third place was the far more individual "Deep Purple," originally an instrumental piece by Peter de Rose, to which an effective text was added by Mitchell Parish.

Abe Olman's "Oh, Johnny," which had been a sensation in 1917, began a new life through the ministrations of Bonnie Baker and Tommy Tucker, proving the timelessness of its basic argument. The nonsense song of 1939 was "Three Little Fishes," reverting to the baby talk brand of humour, with "Little Sir Echo" further exploiting the normal enthusiasm for extreme youth. Other hits of the year included "Umbrella Man," "Deep in a Dream," "Penny Serenade," "Wishing," "Sunrise Serenade," "Over the Rainbow," "Man with the Mandolin," "Scatterbrain," "Blue Orchids," "My Prayer," "And the Angels Sing," "Jeepers Creepers," "Stairway to the Stars" and "Rancho Grande."

The Berlin songs from *Snow White* maintained the popularity they had won in the preceding year.

In 1940, radio and A.S.C.A.P. finally reached a parting of the ways. The National Association of Broadcasters refused to discuss what they considered extortionate demands by A.S.C.A.P. and instituted a boycott which went into effect by the end of the year, with disastrous results for all concerned. Radio set up its own publishing company, Broadcast Music, Inc. (generally known as B.M.I.), and A.S.C.A.P. found out that the public would listen to unlimited arrangements of "Jeanie with the Light Brown Hair" and other noncopyrighted melodies, and that band leaders and soloists were content with whatever material the commercial powers would permit them to use.

Naturally the year produced little of novelty or importance in popular music. B.M.I. failed to land a single song among the first 15 hits, although its publications received considerable attention from the broadcasting programs, notably "Practice Makes Perfect," a pleasant little song by Ernest Gold, formerly employed by the Songmart (a clearinghouse for amateurs) and later a successful composer for the films in Hollywood.

Such songs as "South of the Border," "Oh Johnny" and "Scatterbrain" carried on from the previous year and actually remained at the top of the list so far as sheet music and record sales were concerned. Victor Herbert's old instrumental number, "Indian Summer," was given a set of words, to finish high up among the best sellers. Newcomers in the "Hit Parade" were "Careless," "In an Old Dutch Garden," the "Woodpecker Song," "Playmates," "Make Believe Island," "I'll Never Smile Again" (supposedly inspired by the death of its composer's husband), "Blueberry Hill," "Ferryboat Serenade" and "Only Forever." Walt Disney's *Pinocchio* contributed the popular "When You Wish Upon a Star" and Irving Berlin's "God Bless America" (dating back to 1917) became the people's choice for a national anthem, with all the composer's royalties going to the Boy and Girl Scouts.

An individual surprise turned up late in the year, when

Jerome Kern set an unpretentious melody to Oscar Hammerstein's verses, "The Last Time I Saw Paris," winning a real success in spite of all handicaps. Musical comedy had a good year, being independent of radio, with Cole Porter expressing himself in *Panama Hattie*, Rodgers and Hart in the highly original *Pal Joey*, Berlin in *Louisiana Purchase* and Vernon Duke in *Cabin in the Sky*.

Meanwhile, before the end of 1940 the department of justice had taken a hand in the war between radio and A.S.C.A.P., but before anything practical could be accomplished, popular music experienced perhaps the most dismal year of its entire history. The boycott against A.S.C.A.P. went into effect on the first day of 1941, although its threat had already acted as a serious handicap to the publication and exploitation of copyrighted songs.

According to sales of sheet music, the song of the year was "Intermezzo," revived from a motion picture of the same name, in which it had originally made little impression. Its chief melodic strain came out of Wagner's *Tristan und Isolde*, and its commercial success could be attributed mainly to the lack of competition. Its closest rival was the fox trot version of Tchaikovsky's *Piano Concerto* known as "Tonight We Love." (The same melody appeared in 15 other jazz arrangements, from "Concerto for Two" to "Boogie de Concerto.") The Russian romanticist also appeared among the "first fifteen" in the adaptation of his "Melody" to "The Things I Love."

B.M.I. successfully revived "Amapola" from its stronghold of the E.B. Marks catalogue and also imported the South American "Frenesi." Legitimate nonsense found refuge in the "Hutsut Song" (supposedly based on Scandinavian folk music) and a southern politician rode into office on his own hillbilly imitation, "You Are My Sunshine."

Meredith Willson, known as a serious conductor and symphonist, made a hit with his charming "You and I," and the closing days of the year saw the rise of a timely ballad, "The White Cliffs of Dover." The rest of the machine-made output included "Daddy, Do You Care?" "I Don't Want to Set the World on Fire," "I Hear a Rhapsody," "Maria Elena," "My Sister and I" and the "Shepherd's Serenade."

None of the war songs of 1941 competed seriously with Berlin's "God Bless America." In fact, World War II produced nothing to compare even distantly with U.S. patriotic music of the past. The field of musical comedy was enriched by Cole Porter's *Let's Face It* and that genial product of the pens of Ira Gershwin and Kurt Weill, *Lady in the Dark*, assisted by the performances of Gertrude Lawrence and Danny Kaye.

Irving Berlin was definitely the hero of 1942, which also saw peace forced upon the warring powers of radio and A.S.C.A.P. by the stern intervention of the U.S. government. Berlin's "White Christmas" prophesied a return to the good old days by selling more than 1,000,000 copies, aided by the astute business management of Saul Bornstein, who also had much to do with the success of "God Bless America." The veteran songwriter-publisher had to his credit one of the greatest stage successes of the year, *This is the Army*, which eventually played overseas as well as all over the U.S., and one of the outstanding motion pictures, *Holiday Inn*, with Bing Crosby and Fred Astaire interpreting some more Berlin hits. "Be Careful, It's My Heart" and "I Left My Heart at the Stage Door Canteen" joined the select circle of the "Hit Parade," to round out an impressive year for their composer.

"The White Cliffs of Dover" maintained its popularity and finished the year in second place, within hailing dis-

tance of "White Christmas." Third place went to a rather short-lived war song, "Praise the Lord and Pass the Ammunition," with a tune that suggested "The Old Gray Mare," followed by an obscure piece of hillbilly music, "There's a Star Spangled Banner Waving Somewhere."

Following the trend of "The White Cliffs of Dover," but musically derived from Beethoven's familiar "Minuet in G" was "When the Lights Go On Again," and there was a war flavour also in "Johnny Doughboy Found a Rose in Ireland" and "He Wears a Pair of Silver Wings." Far more popular with the men in uniform was "Don't Sit under the Apple Tree" ("With Anyone Else But Me"), whose tune merely jazzed up the ancient "Long, Long Ago."

Novelty was provided by a jingle of jitterbug jargon called, "Mister Five by Five" (referring to a square-shaped bandman), "Jersey Bounce" and the hand clapping sound effects of "Deep in the Heart of Texas." What was originally intended as a caricature of cowboy songs, "Jingle Jangle," developed into an honest hit, much to the surprise of its creators, while Johnny Mercer succeeded in catching some of the spirit of traditional folk music in his words for "Blues in the Night."

The leading waltz song of 1942 was "Rose O'Day," with echoes of the "far away" of "Round her Neck She Wears a Yellow Ribbon" and the eternal appeal of a fast patter of nonsense syllables. "Somebody Else is Taking my Place" borrowed its melody from Harry von Tilzer's "Please Go 'Way and Let Me Sleep," with no apparent objections from the original composer. Worth mentioning also are "Skylark," "One Dozen Roses" (melodically similar to "The Old Time Religion"), "Sleepy Lagoon" (most-played song on the "Hit Parade"), "My Devotion," Jerome Kern's "Dearly Beloved" and a vocal version of the instrumental "Manhattan Serenade."

The musical war of 1943 was between James Caesar Petrillo and the recording companies. Petrillo forbade his men to make records of any kind until a substantial new tax had been paid by the manufacturers. For a time the record business was practically at a standstill, with a shortage of materials as an added handicap. The new singing star, Frank Sinatra, managed to make a few recordings with choral accompaniment (the musicians' union recognizes only instrumentalists) and the disk manufacturers dug into their backlogs of old "masters," bringing out some music that might otherwise never have reached a phonograph.

Decca finally capitulated, thus getting the jump on its competitors, although at considerable cost.

Richard Rodgers and Oscar Hammerstein II struck a new note and definitely raised the level of popular music in 1943 by writing *Oklahoma!*, the first of a series of creations and productions which set a standard. They brought a sudden dignity and prestige to a business that sadly needed it.

The best song of the year was unquestionably the Rodgers-Hammerstein "People Will Say We're in Love," but *Oklahoma!* contained several other hits, notably the earthy waltz song, "Oh, What a Beautiful Morning!" Hammerstein scored independently with his *Carmen Jones*, a modernization of Georges Bizet's opera, played by an all-Negro cast and produced by that one-time song writer ("Barney Google," etc.), Billy Rose. The death of Lorenz Hart forced Rodgers to find a new collaborator, and it quickly became evident that Hammerstein was the ideal replacement. Their partnership as both writers and producers made a continuous record of phenomenal success.

Of the general run of popular songs in 1943 some of the most successful were well-judged revivals, like "For Me and My Gal" (greatly helped by Judy Garland's screen interpretation) and "Put Your Arms around Me, Honey." The surprise (and perhaps the biggest seller) of the year was the 25-year-old "Paper Doll," which E. B. Marks turned into a spectacular hit long after its apparent death and the actual murder of its composer, Johnny Black. Herman Hupfeld's "As Time Goes By" won a new life through its inclusion in the film, *Casablanca*, where it was sung by Dooley Wilson in association with Ingrid Bergman and Humphrey Bogart.

Frank Sinatra, voted the most popular singer of the year, did much for such sentimental ditties as "All or Nothing at All" and "Sunday, Monday or Always," while the rather absurd, "Don't Get Around Much Any More" eventually profited by the sidesplitting burlesque of Jimmy Savo.

"Pistol Packin' Mama" was the novelty song hit of 1943, with a pseudo-folksy quality, plus hillbilly monotony, to point up its deliberate paradoxes. But a possible best seller of sheet music and records was again "There's a Star Spangled Banner Waving Somewhere," right out of the authentic factory of Bob Miller. Champion of the "Hit Parade" of radio was the motion picture song, "You'll Never Know," which appeared 24 times, 9 times at the top. Other numbers prominent in this popularity poll were Walt Disney's good-neighbour ditty, "Brazil," the air-minded "Comin' in on a Wing and a Prayer" (with a tune suspiciously similar to that of "Jingle Jangle"), "It Can't Be Wrong," "There Are Such Things" and "Taking a Chance on Love," featured in both the film and stage play, *Cabin in the Sky*.

Cole Porter scored again with "You'd Be So Nice to Come Home To," acknowledging some melodic indebtedness to Pablo Sarasate's "Gypsy Airs" and perhaps the traditional "Hoochie Coochie." Berlin's "White Christmas" kept right on selling, with a natural peak during the holiday season. Considerable success was won also by such songs as "Moonlight Becomes You," "That Old Black Magic," "I Had the Craziest Dream" (musically indebted to "Frankie and Johnny"), "I've Heard that Song Before," "Let's Get Lost," "In the Blue of the Evening" and "They're Either Too Young or Too Old," surprisingly sung by Bette Davis in a film produced by its composer, Arthur Schwartz.

Popular music had a good year in 1944, aided by the capitulation of the two biggest recording companies, RCA-Victor and Columbia, to the demands of Petrillo. Not only did the sale of records increase noticeably, but the efforts of Tin Pan Alley met with more consistent success than usual. There was still a dearth of good war songs, and the indications were that the public had permanently turned thumbs down on such material. But there was no lack of successful ballads, novelties and revivals.

The leading hit of the year was probably "I'll Be Seeing You," introduced by Hildegard and heavily favoured by Sinatra. The latter also did much for the sentimental "Good-night, Wherever You Are" and the clearly derivative "I'll Get By," combining the best features of Anton Dvořák's "Humoresque" and the folk song, "Estrellita."

Irving Berlin enjoyed a revival of his "Always," added to the continuing success of "White Christmas," and even the vapid "Paper Doll" managed to stay near the top of the "Hit Parade" far beyond the expectations of its publishers. Other old-timers to appeal to modern ears were "It Had to

be You" and "Together," the latter featured in the film, *Since You Went Away*.

"Dance with a Dolly" frankly exploited the gay tune and some of the words immortalized by a minstrel song of 1848, "Buffalo Gals" (originally "Lubly Fan," written by Cool White). The Latin-American "Besame Mucho" borrowed its leading phrase from the "Goyescas" of Enrique Granados, while "It's Love, Love, Love" came straight from the Calypso music of Trinidad, with a close relationship to "The Duke and Duchess of Kent." "My Heart Tells Me" belonged to the same melodic school as "Goodnight, Sweetheart," with Franz Schubert and Franz Liszt as possible ancestors, and the lively "San Fernando Valley" could hardly escape comparison with "Sweet and Hot" ("I Gotta Have Music") sung years before by the temperamental Lyda Roberti.

There was novelty and a real laugh in the nonsensical "Mairzy Doats," purporting to be a child's pronunciation of "Mares eat oats," and this bit of gibberish upheld a tradition that went all the way back to the Elizabethan madrigals, when a "Hey nonny no" had not yet added a "hotcha-cha." Novelty and humour raised their pretty heads also in "Milkman, Keep Those Bottles Quiet" (raucously delivered by Nancy Walker) and "Is You Is or Is You Ain't My Baby?"

A quieter spirit pervaded the charming lullaby, "Shoo, Shoo, Baby," whose best interpreter was the beautiful Lena Horne.

It may be doubted whether 1944 produced a better popular song than "Swinging on a Star," happily blessed by the voice of Bing Crosby in the immensely successful motion picture, *Going My Way*. Its nearest rival was probably Jerome Kern's, "Long Ago and Far Away," with a typical melodic line and the inevitable suggestion of superior musicianship associated with that substantial composer. Like "Swinging on a Star," it had its inception in a motion picture, with Rita Hayworth as the singer in *Cover Girl*.

Far below such standards, but winning their full share of applause, were "No Love, No Nothin'," "I Couldn't Sleep a Wink Last Night," "Poinciana," "When They Talk About You," "How Many Hearts Have You Broken?" and "I'm Making Believe." The "Trolley Song" came to the rescue just in time and was a well-established hit long before Judy Garland could be heard singing it on the screen in *Meet Me in Saint Louis*.

Cole Porter made his customary contribution to the better type of popular music. He first gave a new twist to the platitude, "I Love You," sung by Wilbur Evans in the musical comedy, *Mexican Hayride*, and then crashed unexpectedly into the hillbilly list with "Don't Fence Me In," a frankly "corny" tune, popularized by the Andrews sisters on a record and in the motion picture, *Hollywood Canteen*. (A legitimate ancestor might have been the old nursery song, "Polly Wolly Doodle.")

One of the later hits of 1944 was the melodious "I'll Walk Alone" (with benefit of Sinatra) and the Latin-American influence made itself pleasantly felt once more in "Amor, Amor, Amor," which spells love in any language. Musical Americana continued to enliven the stage, with *Bloomer Girl* reflecting the success of *Oklahoma!* and a highly original revue, *On the Town*, bringing Leonard Bernstein into the lighter field, enlarging his equally successful ballet, *Fancy Free*.

Frederic Chopin joined Richard Rodgers at the top of the list of the U.S.'s favourite composers for the year 1945.

Frank Sinatra, singing with the New York Philharmonic at Lewisohn stadium, New York city, Aug. 3, 1943

The Polish patriot, who died in 1849, was suddenly discovered by a huge new audience, chiefly through the film, *A Song to Remember*, which idealized and considerably fictionized his romance with Mme. Dudevant (George Sand), played by Merle Oberon opposite Cornel Wilde's Chopin, with Paul Muni in the background as the composer-pianist's teacher.

Regardless of historical accuracy, *A Song to Remember* profited by the off-screen piano playing of José Iturbi (well established as a Hollywood star), and this attractive motion picture proved to be the first musical biography of the screen to appeal to the large public represented by New York's Radio City Music hall, where the film played for a record-breaking six weeks.

The popularity of Chopin's "Polonaise in A-flat," which began in the movie theatres and continued through the stage musical, *Polonaise*, reached a climax with the popular song, "Till the End of Time," adapted by Buddy Kaye and Ted Mossman, and clearly Tin Pan Alley's hit of the year. (Bing Crosby quite properly objected to the sentimentalizing of an essentially heroic theme, but his crooning records added enormously to the popularity of the song.)

Publishers of popular music stimulated the Chopin craze still further by bringing out simplified versions of his best-known piano pieces, including the spectacular "Polonaise" itself, which created something like a world record

by appearing in 15th place on the list of hits while its offspring, "Till the End of Time," was riding at the top.

Another Chopin composition, the "Fantasie-Improptu in C-Sharp minor," achieved an indirect popularity through the revival of "I'm Always Chasing Rainbows" in a highly anachronistic film called *The Dolly Sisters* (played by those un-Hungarian platinum blondes, Betty Grable and June Haver). The song (already a hit some 25 years before) was credited to Harry Fox instead of its actual adapter, Harry Carroll, with no mention of Chopin whatever.

The famous "Minute Waltz" also received some new attention, with the distinction of having a screen performance in exactly one minute, which is considerably faster than the concert pianists play it.

Rodgers and Hammerstein continued their effective teamwork throughout 1945, with *Oklahoma!* breaking all records for the musical stage and finding an equally successful running mate in *Carousel*, adapted from the *Liliom* of Ferenc Molnar and given a New England setting. This new musical show contained the year's best popular song, "If I Loved You," whose melody might have been written by Johannes Brahms and whose words taught a new lesson to Broadway's lyricists.

The best light musical film of the year, *State Fair*, was also primarily the work of Rodgers and Hammerstein. Two of its songs, "It Might as Well be Spring" and "That's for Me," soon entered the "smash" class, the former eventually winning Hollywood's academy award as the top screen song of the year. At one time both of these numbers appeared in the "Hit Parade" along with "If I Loved You," creating a new record of three out of nine by the same writers in radio's hall of fame. All three showed a distinction of style and individuality of words and music seldom achieved by popular song writers.

Chopin and Rodgers received comparatively little competition from the rest of the popular music of 1945. There was novelty in the pseudopsychological "Accentuate the Positive," whose text showed the skill and humour of Johnny Mercer, but with a melody that merely echoed "Praise the Lord and Pass the Ammunition," with "The Old Gray Mare" as a common ancestor. Words were also more important than tune in the current railroad song, "The Atchison, Topeka and the Santa Fe," which was played to death even before Judy Garland had a chance to exploit it in the film, *The Harvey Girls*. The conventionally catchy "Sentimental Journey" similarly capitalized its lyric rather than its tune.

A reversion to the old-fashioned subject of dreams resulted in three big hits of 1945, headed by "My Dreams are Getting Better All the Time," another example of the importance of words as compared with music. Then came a song called simply "Dream," followed by the more frivolous "I'll Buy that Dream."

Cole Porter's "Don't Fence Me In" carried over from 1944 and was rated by radio's research experts as having the largest "listening audience" of 1945, with Lawrence Tibbett succeeding Frank Sinatra as its high priest. The same composer enjoyed a continuing success for his "Begin the Beguine," now well established as a "standard" favourite. The "Trolley Song" and a few other hits of the preceding year also maintained or increased their popularity, notably "I'll Walk Alone," with less significant additions in "There Goes that Song Again," "I'm Beginning to See the Light" and "A Little on the Lonely Side."

Jerome Kern had his customary hit in "More and More," and an excellent song called "Laura" was helped by a

popular film of the same title, besides showing a quality of words and music considerably above the average. The returning soldiers and sailors received their special tributes from Tin Pan Alley in such songs as "It's Been a Long, Long Time" and "I'm Gonna Love That Guy (Like He's Never Been Loved Before)."

The Calypso trend was emphasized in "Rum and Coca-Cola," a direct importation from Trinidad, whose exact authorship was still the subject of dispute and litigation. A milder stimulant was suggested by "Candy," whose success could not be explained even by its own publisher. "Chickery Chick" was an unimpressive candidate for the nonsense prize of the year, with a late arrival, "Symphony," demanding serious consideration.

A revival of the ancient "Bell Bottom Trousers," with the words cleaned up, paid doubtful respects to the navy, but failed to displace "Anchors Aweigh," which eventually became also a successful film title. Other popular patriotic songs were the "Marines' Hymn" (with a melody from Jacques Offenbach's *Genevieve of Brabant*) and the "Army Air Corps Song," by Robert Crawford, both written long before World War II.

The sensation of 1946 promised to be Irving Berlin's score for *Annie, Get Your Gun*, the musical glorification of sharp-shooting Annie Oakley, produced by the ubiquitous Rodgers and Hammerstein, with the strongly vocal heroine played by Ethel Merman. Three songs from this light opera appeared simultaneously on the "Hit Parade," equalling the producers' own record of the previous year. They were a tender love song, "They Say It's Wonderful," a ribald piece of folk material, "Doin' What Comes Naturally," and an exciting bit of syncopation, "I Got the Sun in the Morning." The same score contained such other successes as "The Girl that I Marry," "Who Do You Love, I Hope" and "You Can't Get a Man with a Gun."

The musical stage received further help from the sophisticated *Billion Dollar Baby*, composed by Morton Gould, revivals of the immortal *Show Boat* of Kern and Hammerstein and Victor Herbert's *Red Mill* and such widely different shows as *Are You With It?*, *The Day before Spring* and *Call Me Mister* (whose outstanding hit was "Along with Me"). Another musical, *Saint Louis Woman*, supplied a successful song called "Come Rain or Come Shine," in the Negro tradition.

The screen also did well by popular music. Jerome Kern's last score, *Centennial Summer*, contained such popular tunes as "All Through the Day" and "In Love in Vain"; Cole Porter was honoured by a film biography called *Night and Day*, containing more than 30 of his songs, in addition to that of the title; Berlin was almost as well represented in *Blue Skies* (without biographical import) and the star of Serge Rachmaninoff shone effulgently upon the Republic production originally titled *Concerto*, but handed over to the box office as *I've Always Loved You*.

Rachmaninoff's *Second Piano Concerto* made him the logical successor to Chopin, Edvard Grieg and Peter Tschaikovsky, with its final theme appearing in several popular songs, of which the most successful was "Full Moon and Empty Arms," adapted by the same Buddy Kaye and Ted Mossman who had formerly helped Chopin and themselves to "Till the End of Time."

Early hits of 1946 included the already established "Symphony," of foreign origin, "It's Been a Long, Long Time," and the naughtily funny "Personality," sung by Dorothy

Lamour in the Bing Crosby-Bob Hope film, *Road to Utopia*. "I'm Always Chasing Rainbows" was joined by the reminiscent "I Can't Begin to Tell You," from *The Dolly Sisters*. In time the U.S. public succumbed to a colourless ditty called "The Gypsy," responding also to "Surrender," "To Each His Own," "Prisoner of Love" (a revival), "I Don't Know Enough about You," "I Don't Know Why" (another revival), "Sioux City Sue" (pure "corn"), "Do You Love Me?" "All the Time" and "One More Tomorrow." The old-fashioned "torch song," "Laughing on the Outside (Crying on the Inside)," had the distinction of a record number of infringement claims, of which one or two threatened to get into court; and a commercial radio jingle, "Chiquita Banana," pioneered as a sheet music seller, besides contributing toward food conservation through the altruism of its sponsor. (See also RADIO.) (S. Sp.)

Music in Industry.—Many thousands of plants in the United Kingdom and the United States were equipped during World War II and the postwar period to distribute music to their various departments. Similarly, commercial enterprises introduced music into their accounting rooms to counteract the boredom of concentration upon figures. There were instances of banks, insurance companies and other similar enterprises whose employees accomplished their daily tasks to the accompaniment of subdued music. There appeared to be a growing enthusiasm among workers for this attractive new element in the daily routine. Music often was extended beyond the work period into lunch hours and rest periods on the theory that the worker, diverted by music, would return to his task with renewed spirit.

General use of music in industry was a direct result of the British government's concern with the welfare of war workers. The British Broadcasting company was called upon by the government to broadcast at certain hours music suitable for industrial plants; it had been found that these plants through lack of familiarity with the problems involved were defeating the purposes of "music-while-you-work" through basic mistakes, chiefly faulty programming.

Beginning in the summer of 1940, the project spread through virtually all English plants in war work and rapidly was taken up by other English industries. U.S. industry soon adopted the plan.

The claim was made that programming could be standardized to meet the varying requirements of almost all industry. Certain fundamentals were known. Fast music did not mean fast work.

A sharply defined melody was preferable to rich orchestration. A slow waltz tempo was favoured a few minutes before the usual midmorning or midafternoon fatigue period.

Instrumental music was preferred, for the listener often was distracted in an effort to follow the spoken word.

Mussolini, Benito

Mussolini (1883–1945), Italian journalist, founder and leader (*Duce*) of the Fascist party, and head of the government of Italy from 1925 to 1943, was born July 29, 1883, in Predappio, province of Forlì. He received sufficient formal education to qualify as a school teacher, but his rebellious and ambitious spirit drew him into the socialist movement, in which he rose rapidly to the editorship of the official organ, *Avanti*, in 1912.

As a socialist leader Mussolini was anticlerical, anti-monarchical, antiparliamentary, an advocate of violence and direct action.

Following his shift to the cause of intervention of Italy in World War I he was expelled from the Socialist party, and founded a new paper, *Il Popolo d'Italia* (October–November, 1914). He served for a time as a Bersagliere, was wounded and returned to his paper, through which he continued his feud with the socialists. The original fascist movement founded in 1919 was composed of revolutionary veterans, but it attracted few adherents among the workmen.

With the influx of reactionary elements after 1920, the movement was transformed; with the connivance of members of Giovanni Giolitti's cabinet its armed squads carried on a civil war against the socialists. The paralysis of parliamentary government and the refusal of the king and the Facta cabinet to agree to proclaim martial law paved the way for the appointment of Mussolini as prime minister and the unopposed march on Rome by the Black Shirts (October, 1922).

After the crisis which arose from knowledge that henchmen of the prime minister were responsible for the murder of the socialist deputy Giacomo Matteotti (June 10, 1924), a series of laws were enacted which transformed the government into a personal dictatorship although the *Statuto* was not formally abolished. Mussolini's most enduring accomplishment was the settlement of the Roman question and the re-establishment of Catholicism as the religion of the state by the Lateran Agreements of 1929. As head of the government Mussolini aligned himself with the monarchy, the church, the propertied classes and attempted to create a new Roman empire. For a time he was remarkably successful in exploiting the new position of Italy in Europe which ensued from the disappearance of the Hapsburg empire and the temporary eclipse of Germany and soviet Russia as military powers. He reached the zenith of his prestige by the conquest of Ethiopia (1935–36).

After the formation of the Rome-Berlin axis (1936) his name and fame were overshadowed by that of Hitler, yet he brought Italy into World War II (June 10, 1940), hoping to gain an empire on the Mediterranean by German victories. The attacks which he ordered in Greece and Egypt failed miserably, forced the Germans into the Balkan and African campaigns, and opened the way for their occupation of Italy. When the Anglo-American armies drove the axis forces out of Africa, Benito Mussolini's fate was sealed.

The king dismissed him after the revolt of dissident fascist leaders in the grand council (July 25, 1943) and had him placed under arrest.

He was liberated from the Gran Sasso by German paratroopers in September, and served until the end of the war as head of a puppet regime, the Italian Social republic.

Mussolini speaking to huge crowds gathered at Turin, Italy, in 1939, when he announced the ten-year military alliance with Germany

It collapsed with the German military defeat, and Mussolini was captured and executed at Dongo by Italian partisans (April 28, 1945).

Muti, Ettore

Muti (1902-1943), Italian politician and soldier, was born May 22, 1902. He volunteered in the Italian army during World War I, fought with D'Annunzio's troops at Fiume and returned home a bemedalled teen-age hero. Muti joined the fascist ranks before the march on Rome and was known as the "strong-arm" leader of Mussolini's palace guard, although nominally he was ranked as a minor fascist official.

He served as lieutenant colonel in the Ethiopian campaign, participated in the Spanish Civil War and the Italian campaigns in Albania and Greece, becoming one of Italy's most decorated air heroes. Muti's "devotion" to the Fascist party and his ruthless personality were recognized in 1937 when Mussolini named him secretary general of the Fascist party.

When Il Duce resigned in July 1943, it was reported that Muti fled to escape the wrath of his anti-fascist victims. His death was announced by an Italian news agency, Aug. 24, 1943.

Nagano, Osami

Nagano (1880-1947), Japanese naval officer and diplomat, was born in June 1880 at Kochi, Japan. After graduating from the naval academy in 1900, he attended the naval staff college. In 1913 he was a language officer in the United States, where he studied law at Harvard university and took courses at the War college. As naval attaché in Washington from 1920-23, he participated in the Washington naval conference of 1921-22. Known for his shrewd diplomacy, he represented his government at a number of international conferences. At the London naval conference of 1935-36 Nagano sealed the doom of the 5-5-3 ratio; he rejected Pres. Roosevelt's proposal of a 20% reduction, and when his demands for Japanese parity were refused, he led the Japanese delegation from the conference. In 1936 Nagano was appointed minister of the navy in the Hirota cabinet. The following year he was named commander in chief of the combined Japanese fleets. Nagano became chief of staff of the Japanese navy in April 1941. Early Japanese naval successes after Pearl Harbor braced Nagano's reputation as a naval strategist, but subsequent reverses led to his removal as chief of staff in Feb. 1944. Following the defeat of Japan Nagano was indicted as a war criminal; but he died at Tokyo, Jan. 5, 1947, before completion of the trial.

Nahas Pasha, Mustapha

Nahas Pasha (1876-), Egyptian statesman, was a telegraph clerk in his youth, but later qualified in law at Cairo and became a judge. After World War I his activities as a nationalist led to his deportation to Malta, but his exile was brief, and after his return he became chief Wafdist representative in Sarwat Pasha's coalition government. Nahas Pasha became leader of the Wafdist party in Aug.

1927 as well as president of the chamber of deputies. In Feb. 1928 he successfully led the opposition to the projected treaty with Great Britain on the ground that it did not provide for the complete evacuation of British troops from Egypt. He was premier from March to July of that year, and again for a short time early in 1930. In March 1936 he headed the Egyptian delegation to the conference that preceded the signing on Aug. 26 of the Anglo-Egyptian treaty of alliance, by which Egypt attained sovereign statehood. He was premier again in May, holding also the portfolios of the interior and health. In Dec. 1937, following a disagreement between King Farouk and Nahas Pasha concerning mainly a projected bill to protect the constitution and the maintenance by the Wafdists of a "Blueshirt" army, the king dismissed Nahas Pasha and the entire cabinet. In Feb. 1942 Nahas Pasha once again assumed the prime ministership and the posts of minister of the interior and of foreign affairs. Removed from office in 1944, he continued as leader of the Wafdists, and was the object of an unsuccessful assassination plot in April 1946.

Nanking

Nanking had been the capital of China from 1928. On Nov. 20, 1937, the Chinese government, pressed by the Japanese attack on near-by Shanghai, formally announced the removal of the capital to Chungking. On Dec. 13 of the same year, Nanking fell to the Japanese.

The Japanese pillaged Nanking savagely for almost five months after its fall. According to neutral estimates, more than 10,000 unarmed persons were killed, and more than 20,000 cases of rape were committed. The rape of Nanking was undoubtedly one of the darkest pages in history.

On March 28, 1938, the Japanese established in Nanking the puppet regime called the Reformed Government of the Republic of China. For a time it was on the same footing with the provisional government in Peiping. On March 30, 1940, both of them were superseded by the National Government of China, headed by Wang Ching-wei. After Wang's death in 1944 he was succeeded by Chen Kung-po. Tried as a traitor, Chen Kung-po was sentenced to death and shot by a firing squad in June 1946.

On Aug. 27, 1945, Lieut. Gen. Leng Hsin of the Chinese army arrived in Nanking to make arrangements for the Japanese surrender. The formal surrender took place in the Central Military academy, Gen. Ho Ying-chin, commander in chief of the Chinese army, representing China, and Gen. Yasutsuga Okamura, commander of the Japanese army in central China, representing Japan.

The Chinese government immediately made arrangements to move the capital from Chungking back to Nanking. On May 5, 1946, a ceremony to celebrate the return of the capital took place, presided over by Generalissimo Chiang Kai-shek.

Nanking was repeatedly bombed during the first few months of World War II. It was also damaged by fighting before the evacuation. According to Mayor Ma Chao-chun, the population dropped from the 1937 figure of 1,189,580 to 667,600, plus 200,000 Japanese at the time of the surrender. Of the 167,254 buildings in prewar Nanking 4,596 were ruined in the war, while 187 new ones were built.

Nanking held its first municipal elections in Oct. 1946, electing a municipal assembly. It remained a municipality

directly under the jurisdiction of the central government. (C. CN.)

Narcotics and Narcotic Traffic

On Dec. 6, 1945, the Preparatory commission of the United Nations adopted a resolution providing for the creation of a Commission on Narcotic Drugs under the Economic and Social council. This commission was to consist of 15 members representing their respective governments, as follows: China, United Kingdom, United States, U.S.S.R., France, India, Netherlands, Canada, Mexico, Turkey, Egypt, Iran, Yugoslavia, Peru and Poland. It was organized to carry on the work formerly done by the Opium Advisory committee of the League of Nations, and to advise the Economic and Social council on all matters pertaining to policy and application of international conventions in the field of dangerous drugs.

World War II had found the battered League of Nations hanging almost exclusively on opium control as its last shred of international activity. Even axis countries maintained control set up by treaties and promised to submit figures on production and consumption after cessation of hostilities. The two international bodies, the Permanent Central Opium board set up under the Geneva convention of 1925, and the Drug Supervisory body set up under the Limitation convention of 1931, found shelter in Washington, D.C., from which point they received reports from all over the world including those which the axis allowed to be sent from occupied countries such as Norway, the Netherlands, Denmark and Hungary. The one glaring gap in the lack of international control was in the far east after Japanese invasion.

Postwar Re-establishment of Controls.—About 2,000 U.S. army and navy civil affairs officers were lectured and briefed on the necessity of bringing the opium traffic under control in Japan and in those areas formerly dominated by Japan. Gen. Douglas MacArthur issued orders prohibiting the production and manufacture of narcotic drugs and ordered the Japanese to account for production, distribution and consumption of narcotics since 1930.

Narcotic control in Germany was undertaken by the Four Powers under a quadripartite agreement. Control in the U.S. zone was decentralized and placed in the three *Lander* subzones. Little information was forthcoming as to control in the other three zones and it was apparent that a centralized narcotic control system in Germany was desirable in order to prevent illicit trafficking from becoming a major problem in any one of the four zones.

It was evident that during World War II Germany supplied most of its narcotic needs with morphine derived from the manufacture of poppy straw.

Limitation of Production.—The United States congress adopted the Judd resolution, approved July 1, 1944, pursuant to which the government urged all poppy-growing nations to enter into an international agreement to reduce the production of opium to the medical and scientific needs of the world. Copies of this resolution were transmitted to Great Britain (on behalf of India and Burma), Iran, Afghanistan, the U.S.S.R., Turkey, Yugoslavia, China and Mexico. Of those nations, Afghanistan agreed not only to limit the production of the opium poppy but to ban it entirely after March 21, 1945. The government of

Afghanistan declared that "in the interest of international co-operation and because of humanitarian sentiment, it is ready to take this important step."

In May 1946 Iran ordered the production of opium to cease because of a tremendous addiction problem in that country.

The total estimated annual world production of opium in 1946 amounted to about 2,500 tons. It was estimated that in normal times the annual needs for medical purposes had not exceeded 400 tons. The inevitable result of such a system was an annual surplus for the illicit traffic.

Medical Needs.—About 1937, the U.S. government, in co-operation with the opium alkaloidal manufacturers, established a stock pile of opium which was placed in the gold vaults of the treasury department in Washington, D.C. This stock pile, created for use in the event of war, was the only critical and strategic material which was available in the United States throughout World War II in sufficient quantity, particularly within the medical group. The stock pile was of use in assisting members of the United Nations in maintaining control throughout the hostilities. A morphine syrette, developed in the United States and widely distributed in planes, tanks and on the battle front, was greatly responsible for the saving of lives following initial shock and injury.

Far East.—The Japanese began their perpetration of narcotic warfare in China by encouraging production and consumption. A sharp and outstanding illustration was the manufacture in Korea in 1938 and 1939 of a sufficient amount of heroin each year to supply the total medical needs of the world. This heroin was sent to Manchuria for distribution by the Japanese monopoly. The Japanese government reported to the League of Nations under the International Narcotic conventions that no heroin had been manufactured in Korea during those years.

The Chinese government had made remarkable progress in opium eradication and in suppression of the abuse of opium throughout that part of China under control of the national government. Many hospitals were turned over to bring about cure of drug addiction. Each year approximately 1,000 executions occurred for violation of the government antiopium laws.

The smoking opium monopolies maintained by the British in Hong Kong showed a loss to the government. Not more than 1,000 smokers patronized the government shops, whereas the police reported about 90,000 smokers obtained their supplies from illicit sources. This indicated a complete breakdown of the monopoly system. At the beginning of the war in the far east the monopolies maintained by the British in Hong Kong, Malaya Straits Settlements, Borneo and Burma were taken over by the Japanese government and continued in operation. The same held true for the monopolies maintained by the French in Indo-China, by the Dutch government in Indonesia and by the Siamese government. In Nov. 1943 the British and Dutch governments both announced that upon the recapture of their territories from the Japanese, the smoking opium monopolies would not be re-established and the licensed sale of nonmedical opium would be prohibited. The French made a similar announcement respecting Indo-China. In June 1946 the Portuguese government closed opium retail shops in Macao. These commitments had been carried out at the end of the decade except in Burma. However, there was still nonmedical use of opium in India and Siam.

U.S. Illicit Traffic.—Many important international and national narcotic traffickers were convicted through close co-operation with international narcotic police, particu-

larly with the help of the Canadian authorities.

A number of the defendants in the notorious Murder, Inc., were convicted for smuggling narcotic drugs from the Japanese concession in Tientsin into the United States in the baggage of ostensible round-the-world tourists. In approximately one year they smuggled sufficient drugs to supply the needs of 10,000 addicts for that period.

With the cutting off, during World War II, of southern Europe and the far east as sources of supply of raw and prepared opium, Great Britain, Iran, India and Mexico, in the order named, supplanted China, Macao, Yugoslavia, Italy and France as the major bases for opium smuggling operations to the United States. Once shipping was being resumed between European and certain near eastern ports, however, there were indications that narcotic drugs were available in these ports for smuggling to the United States. This seemed particularly true of marijuana (cannabis).

The numerous seizures of Iranian and Indian raw opium on vessels sailing from British ports continued to be of the utmost significance and constituted a serious enforcement problem. A number of the vessels involved in the smuggling of opium into the Atlantic coast area came from British ports. These vessels employed Chinese crews who frequently purchased opium from acquaintances in the large Chinese transient colony in Liverpool and concealed it in innumerable cleverly contrived hiding places on the ships. As soon as customs officers had finished searching one section of a vessel, the Chinese crewmen would remove their supplies of opium from their hiding places and secrete them in the sections of the ship just searched, thus necessitating constant re-search of vessels as long as they remained in port. Occasionally 14 or 15 opium seizures would be made on one vessel in a period of a few days.

Of equal significance appeared to be the increasing number of seizures of raw opium of Indian origin. Iranian opium continued to be the most frequent type seized and constituted the heaviest total.

Drugs available to the illicit traffic continued to be relatively scarce and prices remained extremely high. Morphine sulphate, stolen or diverted from legitimate channels, was more available than heroin in some sections of the U.S., but highly adulterated heroin was obtainable at almost prohibitive prices. Opium was most freely available in the New York area, the Mexican border and southern California.

The Mexican authorities organized expeditions in their annual effort to destroy fields of opium poppies in remote and inaccessible regions. Accompanying each expedition and acting in an advisory capacity was a representative of the United States. The flow of opium from the Mexican states of Sonora, Sinaloa, Durango and Chihuahua into the United States continued, and it was evident that severe measures had to be taken to eliminate the clandestine opium poppy production in Mexico.

The shortage and extremely high price of narcotic drugs continued to lead addicts and peddlers to resort to various methods to obtain supplies from medicinal stocks. There was an increase over the already substantial number of robberies and burglaries of narcotic drug stocks in pharmacies and other registered establishments. These depredations continued to represent a substantial diversion of narcotics, despite the fact that the bureau of narcotics and local police, in co-operation with each other and acting independently, were able to bring about the arrest of

many of the perpetrators of these crimes. There continued to be numerous cases involving forgery of narcotic prescriptions by addicts in attempts to secure drugs. The demands of addicts were met partially by the use of medicinal opium, morphine sulphate and codeine stolen from pharmacies and similar establishments. Other addicts attempted to satisfy their cravings with paregoric or similar preparations containing small quantities of opiates in combination with other medicinal ingredients, or with barbituric acid derivatives, called, in the underworld "yellow jackets," "goof balls," etc.

Addiction.—The rate of addiction fell rapidly throughout the world because of the controls placed on manufacture and distribution by international narcotic treaties. For instance, as a striking example of the fall in drug addiction typical in many places in the world, in the United States during World War I there was one rejection for drug addiction out of every 1,000 men processed; whereas during World War II in processing 12,500,000 men between the 18 to 38 age group only one in every 10,000 was rejected for drug addiction.

Drug Addiction Research.—The Committee on Drug Addiction of the National Research Council conducted a program which had as its primary object the synthesis of drugs, having little or no tendency to cause addiction, which might serve to replace morphine, heroin and other dangerous narcotics in their therapeutic applications. The selection of compounds for clinical trial and addiction studies was made on the basis of pharmacological experiments covering about 200 morphine derivatives, most of which were prepared for the first time. The funds for clinical studies at the University of Virginia, Charlottesville, Va., and for pharmacological studies at the University of Wisconsin, Madison, Wis., were provided by the Rockefeller foundation.

Metopon was one of the many compounds made and studied in this co-ordinated effort. It gave promise of developing into a very satisfactory drug for the control of pain in terminal cancer cases and possibly in other terminal diseases. Chemically, metopon is a morphine derivative. Pharmacologically, it is qualitatively like morphine even to the properties of tolerance and addiction liability. It differs from morphine quantitatively in all of its important actions. Its analgesic effectiveness is at least double and its duration action is about equal to that of morphine. It is nearly devoid of emetic action. In terminal malignancy administered orally, it gives adequate pain relief, with very little mental dulling and without nausea or vomiting. The drug is particularly adapted to terminal cancer cases where home treatment is desirable. It has many psychological advantages over morphine, particularly its advantages over hypodermic injection.

Uniform State Narcotic Drug Law.—To supplement the federal narcotic laws with special reference to certain phases of intrastate traffic, a Uniform State Narcotic law had been adopted in 42 states and the District of Columbia by 1946, and two of the remaining states, California and Pennsylvania, had in effect state narcotic laws of comparable efficacy. Four states, Kansas, Massachusetts, New Hampshire and Washington, had not adopted the uniform law and, in the opinion of the bureau, did not have in effect a state narcotic law comparable in regulatory efficacy with the Uniform State law.

Demerol (Isonipecaïne).—On July 1, 1944, a law was approved extending the application of the federal narcotic laws to the synthetic drug isonipecaïne, which is a chemi-

cally descriptive term for the trade-mark name "Demerol." Under this law isonipecaïne, a substitute for morphine, became subject to the same control from the federal standpoint as was morphine, except that no provision was made for exempt preparations containing isonipecaïne, as in the case of morphine.

While isonipecaïne has no chemical relationship to morphine, it has definite morphinelike physiological characteristics and is habit forming. The substance is identified chemically as 1 methyl-4-phenylpiperidine-4-carboxylic acid ethyl ester.

Other substitutes developed were being carefully scrutinized and studied. The Robertson bill passed by congress in 1946 was designed to bring all future habit-forming drugs creating addiction similar to that caused by morphine and cocaine under strict control.

Marijuana.—The Marijuana Tax act was passed in the United States in 1937 because of widespread abuse and crimes attributed to the smoking of marijuana cigarettes. The users of this drug appeared to be a younger group than morphine users. After passage of the act the drug cannabis virtually disappeared from the practice of medicine. It was deleted from the United States Pharmacopoeia.

The hemp industry in the United States, centred in Wisconsin, Minnesota and a few adjoining states, was protected by allowing the growers to register under the act. The flowering tops containing the resin drug were destroyed in the manufacturing process. When the United States entered World War II, importation of Manila hemp ceased. It was necessary to increase the acreage to provide sufficient hemp for wartime needs. About 47 processing plants were set up in five middle-western states.

Cannabis research was undertaken by a subcommittee of the League of Nations and progress was under way when the war started.

In India cannabis continued to be sold in the same way as opium across the counter. It was also sold in tobacco shops of the regency in Spanish Morocco, French Morocco and French Tunisia. Widespread abuse continued in Egypt, the drug being smuggled from Syria and Lebanon.

Barbiturates.—Because of an upward trend in abusive use, extending to sleeping-tablet suicides, there was a growing demand for stricter control of a group of preparations known as barbitol drugs, such as amytal, luminal, nembutal, etc.

On Oct. 12, 1945, the American Pharmaceutical association called a conference in Washington, D.C., of interested groups to discuss the problems arising from the misuse of barbiturates. Representatives were present from the American Medical association, American Dental association, American Hospital association, United States public health service, United States bureau of narcotics and United States Food and Drug administration.

Discussion was held on barbiturate regulation, barbiturate habituation and tolerance, and the medical pharmaceutical and legal aspects of the problem. Accidental deaths and suicides directly attributable to the effect of the drugs were on the increase.

Control at the state level was recommended. Fourteen states and the District of Columbia had no law regulating the sale and distribution of barbiturates in 1946. The laws in the other states were not uniform, and most of them were believed to be inadequate. (H. J. A.)

National Guard, U.S.

The national guard made four outstanding contributions to the United States national welfare between 1937

and 1946. These were: (1) its part in raising the morale of the army after its induction into the national service; (2) its pioneering in motorization; (3) its combat record; and, (4) its preparation for a still larger role in the military history of the United States.

The Morale Factor.—To understand the morale problem which faced the U.S. army at the time that it ceased temporarily to be a strictly professional organization and became for the most part a citizen army, it is necessary to go back to 1927. In that year the record of the army as regards morale was worse than in any other year for which it had collected and published adequate statistics regarding its losses. This situation was apparently a result of post-war pacifism, with its accompanying leanness of appropriations and decline in quantity and quality of enlistments.

As of June 30, 1927, according to the report of the secretary of war, there were 113,041 enlisted men in the regular army. Yet during the preceding 12 months 11,580 men, or 10%, had deserted, and the total losses, other than from death and expiration of enlistments, amounted to 36,769, or about one-third of the year-end total.

In this connection it is worth noting that the U.S. army was the only one which published detailed reports covering all phases of its condition, including items reflecting morale, even when morale was below standard. Nothing reflected more clearly the frankness of the war department than the fact that during that period it went on year after year publishing its discouraging morale statistics, and trying to solve the problems which they revealed. That it made tremendous progress toward that end is shown by the secretary of war's report for 1938, the last peacetime year in which the regular army was still virtually unaffected by emergency inductions and enlistments. In 1938 desertions had fallen to 5,686 although 7,916 enlisted men were so acutely displeased with military life that they purchased their release from the army.

That the national guard made important contributions to the morale and stamina of the U.S. army in World War II is clearly indicated in a detailed comparison of the morale items in the report of the secretary of war for 1938 with similar items in his report for 1941. Just as 1938 was the last normal prewar year for the regular army, so 1941 was the first and only year in which the effect of the new elements brought into the army prior to Pearl Harbor could be evaluated in terms of peacetime conduct and attitudes or, more simply, of morale. Those new elements, of course, were the national guard, reservists and selective service conscriptees.

The regular army of 1938 had 12,472 officers and 163,800 enlisted men. The army of 1941 had at the end of the fiscal year 92,643 officers and 1,361,449 enlisted men. The buildup of that force, however, had been on a slowly rising scale, so that the average monthly enlisted strength was only approximately 750,000. Since the national guard came into service at a more rapid rate than that of the men from selective service, the guard averaged throughout the decade 1937-46 about one-third of the total monthly strength of the army.

On the basis of the average monthly strength for the two years the most significant losses were:

Losses per 10,000 officers	Officers				
	Retired	Resigned	Dismissed	Died of disease	Suicide
1938	153	16	3	26	4
1941	28	1	.5	13	3

National guardsmen of New York's 244th coast artillery regiment were among the first called up for a year's duty in Sept. 1940

Losses per 10,000 enlisted men entering army)	Enlisted Men		Inept or not desired	Deserted	Suicide
	Criminals (convicted in civil courts prior to or after died of disease)	Died of disease			
1938	66	15	75	347	4
1941	38	9	27	168	1

It was not claimed that this striking improvement in health, outlook and general fitness for the task at hand was due solely or even preponderantly to the fact that the national guard had been inducted into the army during this period. The guard, however, must be credited with an important part in that achievement. It was certainly not unreasonable to assume that these men and officers, who had prepared themselves for military service virtually at their own expense and who had had higher-than-average standing in their own communities, played a more than average role in the spectacular improvement in the army's morale.

In this connection it was to be borne in mind that the national guard furnished 299,045 of its own officers and men to the federal service, and in addition, prior to June 30, 1941, the national guard divisions absorbed 120,891 selective service conscriptees and had full responsibility for their training. In other words the guard furnished through its own membership slightly more than two-sixths of the army's strength for 1941, and in addition, as part of the army, it had charge of almost one-sixth of that strength through its absorption of conscriptees.

The total average monthly strength of the guard, therefore, plus its absorbees, amounted to approximately one-half of the total average monthly strength of the army of 1941.

Combat Record.—When the final pay-off came in actual combat, the national guard divisions did their full share in upholding the glory of U.S. arms.

National guard divisions were in the assault forces in every important theatre, and the average losses for these divisions were far in excess of the average losses for all the combat divisions, and about the same as those of nine regular army divisions.

The average combat loss per division for all divisions, exclusive of the national guard, in all theatres of the war was 6,176 per division, and for the 19 national guard divi-

sions, 9,166. The average for the nine regular divisions was 14,541. The average for the nine national guard divisions most heavily employed was 14,345.

The statistics covering losses of the nine regular divisions and for the nine national guard divisions most heavily engaged follow:

Regulars		National Guard	
4th Div.	22,429	34th Div.	20,906
9th Div.	19,889	29th Div.	20,754
1st Div.	18,617	30th Div.	18,586
2nd Div.	16,127	35th Div.	15,953
3rd Div.	15,319	28th Div.	13,951
8th Div.	13,791	36th Div.	10,302
5th Div.	11,813	26th Div.	10,243
7th Div.	7,977	45th Div.	9,685
6th Div.	4,910	32nd Div.	8,727
Total	130,872	Total	129,107

The ten divisions, exclusive of both national guard and regular army divisions, which suffered next after the regular divisions are given below, alongside the losses of the remaining ten national guard divisions:

Next Ten		Remaining National Guard	
80th Div.	16,608	43rd Div.	6,982
79th Div.	15,752	27th Div.	6,800
83rd Div.	15,291	37th Div.	6,379
90th Div.	13,902	44th Div.	5,250
106th Div.	9,900	Americal Div.	4,892
101st Air	8,687	41st Div.	4,434
96th Div.	8,655	38th Div.	3,439
78th Div.	8,511	40th Div.	2,864
77th Div.	7,665	33rd Div.	2,282
84th Div.	7,365	31st Div.	1,722
Total	112,336	Total	45,041

Postwar Plans.—The national guard, organized under the act of June 4, 1920, actually operated during the period 1937-46 under substantial amendments enacted in 1933. For the postwar period national guard improved standards were adopted. On Oct. 13, 1945, Secretary of War Robert Porter Patterson approved new policies with regard to the organization and training of units. In Jan. 1946, an improved supply procedure was adopted. This was to be a full scale balanced force capable of instant action on the very day that any nation might hurl its war missiles against the United States. In Feb. 1946 allotments of units on the new troop basis began to be made to the states and the summer of 1946 saw the actual commencement of organization.

guard officers showed that 17,752 national guard officers were inducted into the federal service and that on June 28, 1946, 8,584 of them were still on active duty. The report follows:

Grade in which inducted	Total number inducted	Separated (Federal recognition terminated after induction)	Inactive (Returned to state control)	Active (Still in federal service)
Major general	21	11	6	4
Brigadier general	74	28	29	17
Colonel	273	91	100	82
Lieutenant colonel	1,100	276	366	458
Major	1,379	346	405	628
Captain	5,114	1,124	1,527	2,463
First lieutenant	5,046	1,106	1,372	2,568
Second lieutenant	4,745	1,071	1,310	2,364
Total	17,752	4,053	5,115	8,584

The average of advances in grades of inducted officers was:

Second lieutenants	2.7	Grades
First lieutenants	2.	Grades
Captains	1.5	Grades
Majors	1.1	Grades
Lieutenant colonels	.5	Grades
Colonels	.08	Grades
Brigadier generals	.00	Grades
Major generals	.00	Grades

One brigadier general became a lieutenant general, and three lieutenant colonels became major generals. Nine second lieutenants advanced five grades, and 253 advanced four.

Inducted under national guard commissions were the following:

Grade in which inducted	Total number inducted	Separated (Federal recognition terminated after induction)	Inactive (Returned to state control)	Active (Still in federal service)
Captain	13	1	3	9
First lieutenant	213	31	52	130
Second lieutenant	2,942	610	782	1,550
Total	3,168	642	837	1,689

For the above the grades on June 28, 1946, were: 3 colonels, 92 lieutenant colonels, 419 majors, 901 captains and 274 first lieutenants.

The grand total for induction of officers and commissioned enlisted men from the national guard follows:

Total number inducted	Separated (Federal recognition terminated)	Inactive (Returned to state control)	Active (Still in federal service)
20,920	4,695	5,952	10,273

The national guard thus contributed materially to the war effort. Of the 299,045 officers and men inducted in 1940 and 1941 the majority belonged to combat divisions and 111,596 belonged to nondivisional units such as separate artillery battalions, anti-aircraft, medical, engineer and similar organizations. These were scattered over the globe and their combat records were merged in the general history.

The service of national guard divisions is indicated in the accompanying table, above. (B. B. M.)

258 National Labor Relations Board

The National Labor Relations act was signed into law by Pres. F. D. Roosevelt on July 5, 1935, and declared constitutional by the supreme court in a series of test cases on April 12, 1937. As of July 1, 1946, nearly 90,000 cases, involving millions of employees, had been docketed with the three-man board charged with its administration.

The act was limited; it was not proposed as a cure-all for strikes. It was concerned solely with disputes arising over issues of union recognition and antiunion discrimination.

Of the 89,472 cases filed with the National Labor Relations board, 48,357 concerned questions of conflicting claims of representation and the remaining 41,115 involved allegations of unfair labour practices.

The law applied to industries with materials, products or services moving directly across state lines or affecting the operations of other companies engaged in interstate activity. It did not cover employees of federal, state or municipal governments, nor did it apply to agricultural labourers engaged in activity on a farm. Likewise, it did not have jurisdiction over employees covered by the Railway Labor act.

The board established its national headquarters in Washington, D.C., where also were located its legal staff, hearing examiners, administrative personnel and information office. It also established regional offices in 20 key cities, each responsible for servicing a particular area. Outside the continental United States, the board set up offices in Hawaii and Puerto Rico.

Each regional office was placed under the supervision of a regional director, with a staff of investigators and attorneys to assist him.

The heart of the act was found in its section 7, containing a general summary of the rights guaranteed to workers. It stated that "employees shall have the right to self-organization, to form, join, or assist labor organizations, to bargain collectively through representatives of their own choosing, and to engage in concerted activities, for the purpose of collective bargaining or other mutual aid or protection."

In order to protect workers in the exercise of these rights the act specifically provided for prevention of unfair labour practices (section 8), and selection of representatives for collective bargaining (section 9).

Prevention of Unfair Labour Practices.—Under the act employers were forbidden to engage in any of the five unfair labour practices outlined below:

"1. To interfere with, restrain, or coerce employees in the exercise of the rights guaranteed in section 7."

For example, the act declared it illegal for an employer to (1) discourage employees by any means from joining or forming unions; (2) to question employees as to their union membership or activity; or (3) prevent legitimate union activity on company property, provided such activity was confined to the workers' own time. As of July 1, 1946, a total of 3,797 such allegations had been filed with the board.

"2. To dominate or interfere with the formation or administration of any labor organization or contribute financial or other support to it: provided, that subject to rules and regulations made and published by the board pursuant to section 6 (a), an employer shall not be prohibited from permitting employees to confer with him during working hours without loss of time or pay."

Under this section company-dominated unions or organizations controlled by the employer were banned. For example, the board declared the following sort of conditions violations of this section: (1) an active part by management in forming the organization; (2) pressure by management on workers through company officers to join an organization; (3) management provision of the controlled organization with free publications, eating facilities, etc.; and (4) management favoritism of one organization as opposed to another. Charges alleging violation of the above section had been cited in 5,455 instances.

This section did not bar formation by employees of an independent union or an organization limited to employees of a single company unless it was shown to be dominated, interfered with, contributed to or supported in any way by the employer.

"3. By discrimination in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage membership in any labor organization: Provided, that nothing in this act . . . shall preclude an employer from making an agreement with a labor organization (not established, maintained, or assisted by any action defined in this act as an unfair labor practice) to require as a condition of employment membership therein, if such labor organization is the representative of the employees as provided in section 9 (a), in the appropriate collective bargaining unit covered by such agreement when made."

Under this section the board held it illegal for an employer to: (1) discharge or demote an employee because of his union membership or activity; (2) refuse to hire qualified applicants because of previous union membership or activity; (3) discriminate against union employees by holding back wage increases, by layoff or assignment of more difficult or disagreeable work; and (4) refuse to reinstate an employee laid off or discharged for union activity, or to demand that he give up his union membership in order to be reinstated. Violations of the above section had been charged in 27,113 cases by July 1, 1946.

This section did not affect the employer's right to discharge, transfer, layoff or otherwise change the conditions of employment of a worker for just cause such as disobedience or inefficiency.

"4. To discharge or otherwise discriminate against an employee because he has given testimony under this act."

Charges alleging violation of the above section had been cited in 461 cases.

"5. To refuse to bargain collectively with the representatives of his employees, subject to the provisions of section 9 (a)."

For example, the board found evidence of lack of good faith in bargaining on the part of management under such circumstances: (1) where management refused to negotiate with the representatives chosen by the employees in accordance with section 9 (a) of the act; (2) where management refused to put an agreement in writing and sign it; (3) where management engaged in unfair labour practices during negotiations; (4) where management rejected the union's proposals without submitting counterproposals or attempting to reconcile the differences; (5) where management failed to have its representatives available for conferences with the union at reasonable times and places or failed to appoint representatives with power to reach agreements; and (6) where management refused to consider grievances or disputes arising out of interpretation or administration of a collective contract. On July 1, 1946, 13,361 charges alleging violation of the above section had been docketed.

Procedure in Unfair Labour Practice Cases.—Charges could be filed by any worker who believed that his employer had committed any of the illegal practices. They could be filed by himself or by his union on his behalf, with the regional director with jurisdiction over the area where the alleged illegal act occurred. Of the unfair labour practice charges brought to the board's attention during its first ten years, 14,673 were filed by the Congress of Industrial Organizations; the American Federation of Labor filed 13,770; individuals accounted for 3,306; and 1,905 were filed by unaffiliated unions.

As soon as a director received a charge, he notified the employer of the nature of the allegations in the charge, the name of the person or organization making it and asked him to submit a written statement of his position in respect to the allegations. The director then assigned the case to a field examiner. During this investigation the charges might be adjusted, withdrawn, dismissed or otherwise closed without formal action.

The board endorsed and stressed the use of informal procedures for the achievement of results consistent with public policy. This was evidenced by the fact that of the total 41,115 charges filed with the board, more than 90% were disposed of informally—without the necessity of hearings, decisions or subsequent litigation. If the charges were found to be well grounded and the case was not settled by adjustment, a complaint was issued and a public hearing held before a trial examiner appointed by the board. Following this hearing the trial examiner served upon the parties and sent to the board in Washington, D.C., his findings and recommendations. At this point the case was transferred to Washington. Where compliance was not secured, the aggrieved party could file a statement of exceptions and briefs and could request an oral argument before the board. Upon the basis of the whole record in the case the board then made its decision.

Authority to issue such cease and desist orders was provided in section 10 (c) of the act. Therein the board was authorized, in order to remedy unfair labour practices committed, to issue cease and desist orders and to take such affirmative action, including reinstatement with or without back pay, as would effectuate the policies of the act. Of the total of more than 11,000 formal decisions issued by the board in the decade 1937-46—comprising more than 64 bound volumes—2,600 concerned employer unfair labour practices. To remedy such illegal practices the board ordered the reinstatement of more than 300,000 employees; some with back pay. These compensatory pay awards totalled nearly \$11,000,000. Nearly 2,000 company unions were ordered disestablished. In 5,000 cases collective bargaining was ordered, while in 7,200 cases notices of compliance with board decisions were directed to be posted. These posted notices informed employees that they were free to engage in collective activity without interference, as guaranteed by the act.

Decisions and orders of the board were not self-enforceable. There were no penalties or fines. Either the company or the board might petition the appropriate circuit court of appeals for enforcement. Following this either party might petition the supreme court for review. It was only after a court had upheld a board order and an employer had refused to comply that he might be held in contempt of court and subject to court penalties.

More than 600 board cases were litigated in the various circuit courts of appeals and in the supreme court. In the circuit courts 346 of these were upheld in full, 73 were set aside, and 167 were modified. Of the 52 that reached

the supreme court, board orders were enforced in 48 cases; in only 2 cases were board orders set aside.

Selection of Representatives for Collective Bargaining.—Section 9 (a) of the act provided that "representatives designated or selected for the purpose of collective bargaining by the majority of the employees in a unit appropriate for such purposes, shall be the exclusive representatives of all the employees in such unit for the purpose of collective bargaining in respect to rates of pay, wages, hours of employment, or other conditions of employment: provided, that any individual employee or a group of employees shall have the right at any time to present grievances to their employer."

During the decade the board conducted nearly 30,000 elections and cross checks. The importance of self-determination to the individual worker was demonstrated by the consistently high percentage of eligible employees who actually voted. Throughout this period nearly 7,000,000 workers, or more than 85% of those eligible to vote, actually cast ballots in the elections.

The workers voted for the union of their choice in much the same manner as in a political election. The National Labor Relations board took the position that whether employees selected a bargaining representative or what bargaining representative they selected was the exclusive concern of the employees. Employers, therefore, were expected to observe a policy of strict neutrality both during and before an election and to refrain from influencing or inhibiting the will of employees. The board followed the principle of majority rule; in each case it decided whether the appropriate unit should be the employer unit, plant unit or subdivision thereof.

Investigation of a representation claim was usually initiated by the filing of a petition in the regional office. As of July 1, 1946, 48,357 of these requests for board determination of representatives had been filed. The union was required to produce proof, usually in the form of signed applications for membership, actual dues records or signed authorizations designating the union as the bargaining representative. An amendment of 1939 to the board's rules and regulations provided that an employer might file a petition if two or more unions each claimed to represent a majority of his employees.

In the first ten years of board operation 17,134 petitions were filed by the C.I.O.; the A.F.L. filed 16,019; unaffiliated unions accounted for 4,993; and employers filed 408.

The board devised and made available to the parties several types of procedures through which representation disputes might be resolved without recourse to formal proceedings. These informal arrangements were commonly known as consent cross-check, consent election, stipulated cross-check and stipulated election.

Recognition Agreement.—The simplest type of adjustment of representation cases was the outright recognition agreement. It was signed by both employer and the union and, describing the unit covered, stated that both parties agreed that the union represented a majority of the employees, and that no other labour organization claimed representation in that unit. Furthermore, the employer undertook to recognize and bargain with the union without further proceedings. This agreement was subject to the approval of the regional director.

Consent Cross-Check.—As implied in the name, the consent cross-check was a procedure whereby the field examiner or regional director determined whether or not the

union represented a majority by checking the number of signed union cards against the names on the pay roll furnished by the employer.

Stipulated Cross-Check.—The stipulated cross-check differed from the consent cross-check only in that the parties agreed that the board in Washington should finally dispose of the case either by a formal certification in the event the union won or by a formal dismissal if the union was unsuccessful.

Stipulated Election.—Likewise, the stipulated election provided that the agreed-upon election should be the basis of a formal decision by the board instead of an informal report by the regional director. By the same token, the stipulated election procedure designated the board rather than the regional director to make final determination of questions raised concerning the election.

The informal procedures outlined above accounted for more than 76% of the election cases handled in the first ten years of the board's operation. Of the 38,000 election cases handled, 18,900 were adjusted by informal procedures entirely agreed upon by the parties; 13,300, or 35%, by the consent election; 2,950, or 8%, by the consent cross-check; and 2,650, or 7%, by the recognition agreement.

Prehearing Election.—In many cases the board found that parties were not using the informal procedures because they disagreed over relatively minor issues; e.g., eligibility of a fringe group of employees. Thus, even though they were in complete agreement over practically all the election details, very frequently they went to hearing and awaited a formal decision by the board. To remedy this situation the board amended its rules and regulations to make it possible for representation elections to be conducted in certain types of cases without awaiting a formal direction of election by the board in Washington. If, after the election, the parties wished a hearing and a board determination of the unresolved issue, such hearings were held, or the parties might abide by the results of the election and waive formal proceedings.

If the parties failed to agree on use of the above consent methods, the case proceeded to a hearing and, finally, to a formal board decision either directing an election to be held or dismissing the petition. In directing that an election be held the board's decision set forth the bargaining unit to be voted, the name or names of the unions to appear on the ballot and the period in which the election was to be held. If a majority of those voting selected the union, the board thereupon certified that union to represent the employees in the unit agreed on; if the union failed to receive a majority vote the petition was dismissed by the board.

As of July 1, 1945, affiliates of the C.I.O. had been successful in 10,752 elections; American Federation of Labor unions were the victors in 9,093 elections; independent unions were selected in 2,612 balloting; and no union was chosen in the remaining 4,516 elections.

Contribution to the U.S. War Effort.—The board's contribution to U.S. national welfare throughout the war period continued to be, first, the elimination of unfair labour practices which impeded the acceptance of sound collective bargaining practices, and second, the prompt determination of disputes as to employees' choice of their bargaining agents. In essence, the board recognized that every unsettled question of majority representation and every allegation of unfair labour practice constituted a potential impairment of production and morale which demanded immediate attention. Tested and accepted, its services were

available to resolve such disputes through resort to its orderly and peaceful procedures. In this way the board received and resolved unsettled and highly explosive situations in new and expanding plants affected by the huge impact of World War II upon U.S. industry.

In addition to discharging these duties, the board conducted strike polls, a responsibility assigned it by the War Labor Disputes act, and protected the right of employees affected by the merger of domestic telegraph carriers under an amendment to the Communications act of 1934. In the postwar period the board no longer conducted such strike polls, which were apart and separate from the polls for union representation conducted by the board.

Trends.—Of the 1,400 cases being filed monthly with the board at the end of the decade 1937-46, 1,000 concerned conflicting representation claims and the remaining 400 unfair labour practices. Until 1945 the rise in the ratio of representation cases to unfair labour practice cases continued a trend begun some years previously. In 1937, for example, the unfair labour practice cases comprised 71% of the cases filed with the board, as against 29% representation cases. The trend to representation cases started in 1941, when such cases had climbed to 47.4% of the cases filed. That year marked the beginning of a great increase in the number and proportion of representation cases, which continued throughout the succeeding years. After V-J day, however, the trend has been toward unfair labour practices and, as of July 1, 1946, such cases comprised 33% of those docketed. (See also LABOUR UNIONS; LAW; STRIKES AND LOCK-OUTS.) National Mediation Board

The National Mediation board, an independent federal labour agency in the United States, was established in 1934 by amendment of the Railway Labor act of 1926. The principal function of the board was to seek, through mediation, the settlement of disputes over wages and working conditions between railroad or air transport carriers and their employees. The board also investigated disputes among a carrier's employees as to who should represent them in collective bargaining negotiations. In such cases the board by secret elections or other means ascertained the employees' choice. During the period 1937-46 the board disposed of 2,177 cases dealing with disputes over changes in wages or working conditions and handled 1,424 representation cases.

Amendments, also enacted in 1934, strengthened the right of railroad employees to organize unions of their own choice without interference, influence or coercion by their employers. These amendments were particularly helpful to the nonoperating employees—shop mechanics, clerks, trackmen and similar groups of workers who were not so strongly organized as the operating or train and engine service employees. These nonoperating workers in increasing numbers abandoned company unions which were frequently dominated by the railroad employer and joined national labour organizations representing their respective crafts. By 1946 the mediation board reported that agreements concluded by national unions, such as those comprising machinists, boilermakers, sheet-metal workers and car builders and repairmen, governed wages and working conditions for these crafts on more than 90% of the coun-

try's railroad mileage, as against from 65 to 75% a decade earlier. The total number of railroad labour agreements on file with the mediation board in 1946 exceeded 4,600; of that number 88% had been negotiated by unions national in their scope.

The growth of unions which were completely free from employer influence contributed to the trend toward national, rather than local, collective bargaining between railroad workers and management. In 1937, 1941, 1943 and 1946 union demands for increased wages were handled by the mediation board in national conferences involving all the major railroads and most of their organized employees. Except in 1937, however, these wage cases were not adjusted through mediation, and it was necessary for the president of the United States to appoint impartial fact-finding boards to investigate the controversies and formulate recommendations for their settlement. On two occasions—in 1943 and 1946—the government, confronted with threatened work stoppages on the part of some of the unions, was forced to seize and operate the railroads for short periods of time. This action averted a wartime strike in Dec. 1943 but failed to halt a two-day stoppage in May 1946 which, for the first time in the nation's history, completely paralyzed rail transportation. With this exception, railroad operations, on a broad scale, were not marred by work stoppages throughout the period 1937–46.

Common carriers by air engaged in interstate or foreign commerce were brought within the coverage of the Railway Labor act in 1936. Few cases involving employees of air transport companies came before the mediation board prior to 1941. Subsequent expansion of the industry, coupled with more intensive efforts to unionize air-line pilots, mechanics and other ground-service personnel greatly increased the demand for the board's services by 1946. In that year more than 100 labour agreements between air-line carriers and their employees were in effect, as compared with less than 10 such agreements in 1937.

National Railway Labor Panel.—This agency was created by executive order of the president for the war period as an adjunct to the mediation board. Under the regular procedures of the law the mediation board advised the president of only such unsettled controversies where employees, by imminent strike action, threatened an interruption to interstate commerce. To enable rail and air employees to abide by their no-strike pledge, the chairman of the National Railway Labor panel was authorized to appoint from a roster of about 20 disinterested individuals panel boards to hear disputes concerning which employees signified their intention to refrain from any action inimical to the war effort. Approximately 40 such boards were created under this procedure. The chairman of the panel was also authorized to determine the permissibility, under the government's wage stabilization program, of voluntary (nondispute) applications for wage changes affecting employees covered by the Railway Labor act. National Parks and Monuments, U.S.

In many ways the decade 1937–46 involved a crucial test of the national park idea in the United States. The national parks, national monuments, and other units of the National Park system came through World War II

virtually intact, despite the need for varied uses of these areas in the interest of the prosecution of the war. During the war period particularly there was developed a heightened public appreciation of the significance of the national parks and monuments as remnants of the original U.S. scene and as reminders of the nation's historic past. Nearly 8,000,000 men and women of the armed forces visited them, thereby gaining a greater knowledge of the aesthetic and cultural values of this portion of the federal estate. Visitors in this period totalled approximately 143,000,000. In the opening travel year of the decade (Oct. 1, 1936 to Sept. 30, 1937), 15,133,432 visitors were recorded. From then until World War II travel rose almost steadily, a peak of more than 21,000,000 being reached in 1941. The low occurred in 1943, at the time of greatest travel restrictions, when visitors totalled 6,908,749. There followed a gradual upswing until V-J day, following which, for the last several weeks of the 1945 travel year, vacationers thronged to the parks and monuments, taxing to the utmost the limited wartime facilities available. In some areas visitors had to seek overnight accommodations at points outside the parks and monuments. Later, park and monument staffs and concession operations approached a normal peacetime basis. Nevertheless, taking care of the approximately 21,682,000 visitors during the 1946 travel year, the largest annual travel on record thus far, presented a major problem. In the spring of 1946 the National Park service, desirous of having visitors enjoy their stay in the parks and monuments to the utmost, advised prospective travelers to make advance reservations for accommodations and, if possible, to plan their trips so as to avoid heavy peak loads of travel on weekends and holidays. The fact was also stressed that many of these areas were ideal vacation spots in the spring and fall and not as heavily visited during those seasons as in the summer months. The great bulk of travel, however, continued to come in the three months of July, August and September.

Considerable progress was made during the decade in rounding out the National Park system. On Jan. 1, 1937, the number of units totalled 139, with a combined area of approximately 17,500,000 acres. By the end of 1946 the system contained 169 units with a combined area within the authorized boundaries of approximately 21,000,000 acres, of which about 600,000 acres were in private ownership or the property of state or other local governments. This property, so owned when the areas were added to the National Park system, presented a stumbling block to the proper planning of future developments, particularly insofar as visitor facilities were concerned. Uses being made of some of this nonfederal property were in conflict with established national park standards and jeopardized the natural and historic values of the parks and monuments. Plans were formulated for the orderly acquisition of these lands, by purchase at prices based on impartial appraisals or, wherever possible, by exchange for other lands in government ownership. Acquisition by purchase was contingent upon congressional appropriations.

Of the total of 27 national parks in existence at the close of 1946, the following were established during the decade: Big Bend National park, Tex., containing approximately 700,000 acres of spectacular mountain and desert country in the great bend of the Rio Grande; Isle Royale National park, Mich., largest island in Lake Superior and distinguished for its wilderness character; Kings Canyon National park, Calif., a rugged region dominated by the two enormous canyons of the Kings river and the summit

Yosemite National Park, Calif., showing U.S. soldiers lunching among the sequoias in the Mariposa grove of big trees, in 1943

peaks of the High Sierra (the former General Grant National park, established in 1890, with its giant sequoias, was a detached section of this park); Mammoth Cave National park, Ky., long known as one of the seven wonders of the new world; and Olympic National park, Wash., another mountain wilderness approximately 848,212 acres in extent and noted for its fine remnant of Pacific Northwest rain forests, active glaciers and rare Roosevelt elk. Included in Olympic was the former Mount Olympus National monument.

Under authority of the Antiquities act of 1906, and in a few instances by specific acts of congress, the following 16 national monuments were established after 1936: Ackia Battleground (Miss.); Andrew Johnson (Tenn.); Appomattox Court House (Va.); Badlands (S.D.); Capitol Reef (Utah); Channel Islands (Calif.); Fort Frederica (Ga.); Fort Laramie (Wyo.); Homestead (Neb.); Jackson Hole (Wyo.); Organ Pipe Cactus (Ariz.); Pipestone (Minn.); Tuzigoot (Ariz.); Whitman (Wash.); Zion (Utah); and Santa Rosa Island (Fla.). Congress by act of July 30, 1946, authorized the abolishment of the last-mentioned area and the transfer of its land to Escambia county for local recreational use. Another national monument, Lewis and Clark Cavern, was abolished by act of congress of Aug. 24, 1937, and the land therein was transferred to the state of Montana for park purposes.

Other areas added to the National Park system during the decade were Richmond National Battlefield park, Va.; Thomas Jefferson memorial in the District of Columbia; and ten national historic sites as follows: Adams mansion (Mass.); Atlanta campaign (Ga.); Federal Hall memorial (N.Y.); Fort Raleigh (N.C.); home of Franklin D. Roosevelt (N.Y.); Hopewell village (Pa.); Manassas National Battlefield park (Va.); Old Philadelphia Custom House (Pa.); Salem Maritime (Mass.); and Vanderbilt Mansion (N.Y.). These national historic sites were designated by the secretary of the interior under authority of the Historic Sites act of 1935, and were federally owned. In addition, seven other sites, not in federal ownership, were designated

by the secretary of the interior. These were Gloria Dei (Old Swedes') church and Independence hall (Pa.); Jamestown (Va.); McLoughlin house (Ore.); Saint Paul's church (N.Y.); San Jose mission (Tex.); and Touro synagogue (R.I.). Under co-operative agreements with the owners, the National Park service continued to aid in the program of preserving and interpreting the nonfederal sites to the public.

Fort McHenry (Md.), formerly a national park, and Custer battlefield (Mont.), formerly a national cemetery, were reclassified as national monuments, and Abraham Lincoln (Ky.), formerly a national park, and Chalmette (La.), previously classified as Chalmette Monument and Grounds, became national historical parks.

In addition to the National Park system, the National Park service continued to be responsible for the administration of certain recreational demonstration areas developed with emergency funds more than a decade before. These areas were formed out of misused or overused agricultural and woodlands to demonstrate to communities their value if used for recreation. At one time there were 46 such areas. Acceptance by the state of Oklahoma of the 2,228-acre Lake Murray Recreational Demonstration area, early in 1943, marked the beginning of the process of transferring these areas from federal to other jurisdiction as authorized by the act of congress of June 6, 1942. Nine remained at the close of 1946, and these were eventually to be turned over to the states, or added to existing units of the National Park system.

During the decade, the National Park service also was given the administration of three recreational areas developed as a result of the construction of dams in several western states by the bureau of reclamation of the department of the interior and the corps of engineers, war department. Planning of recreational facilities on the lakes thus formed, and their administration by the National Park service, were governed by co-operative agreements between the National Park service and the bureau of reclamation and the corps of engineers. One such area—at Boulder dam in Arizona-Nevada—was in existence when the decade began. Three more were established, at Shasta

dam and Friant dam in California, and at Denison dam in Texas.

Improved co-ordination between the director's office and the various units of the National Park system was secured as a result of the regionalization of the National Park service in 1937. The regional offices were located in Richmond, Va.; Omaha, Neb.; Santa Fe, N.M.; and San Francisco, Calif.

Substantial funds came from U.S. emergency agencies—the Public Works administration, Civilian Conservation corps and Work Projects administration—for the installation of many needed developments, such as construction of minor roads and trails, water and sewage systems and cabins and other structures, as well as for carrying on the service's broad conservation program, notably in forestry and wildlife protection. These emergency funds also made possible extensive co-operation with state, county and municipal governments in the development of parks and other recreational areas under authority of the Park, Parkway and Recreational Areas Study act of June 23, 1936. They were used also in conducting nation-wide surveys of historic U.S. buildings and sites, in construction of parkways and in acquiring lands along the historic Chesapeake and Ohio canal and restoring a section of it between Georgetown, D.C., and Seneca, Md.

In 1941, National Park Concessions, Inc., a nonprofit distributing corporation, was formed to operate accommodations for visitors in Mammoth Cave National park, Ky. This corporation later took over operation of such facilities in Isle Royale and Olympic National parks and on the Blue Ridge parkway, and began similar operations in Big Bend National park. Another nonprofit distributing organization known as Government Services, Inc., which for more than a quarter of a century had operated cafeterias, newsstands and other services in government buildings in Washington, D.C., took over operation of the Log Cabin Tea house in George Washington Birthplace National monument, Va., in 1946. These operations pointed toward ultimate government ownership of all concession buildings and facilities, though not necessarily government operation. Hitherto, it had been necessary to enlist private capital to provide such facilities, as congress had been unwilling to appropriate funds for this purpose. The system dates back to the organic act of March 1, 1872, establishing Yellowstone National park, which contained a provision authorizing the secretary of the interior in his discretion to "grant leases for building purposes . . . of small parcels of ground" for the erection of buildings for the accommodation of visitors. During World War II one park concessioner offered its facilities for sale for \$2,000,000, but federal funds for the outright purchase of the operation could not be obtained and the nonprofit distributing organizations mentioned above were not able to finance the necessary loan. However, negotiations were again under way, at the end of 1946, to secure such a loan. The objective of government ownership of all buildings and plants arose from recognized disadvantages of large investments of private capital on federal lands. As it was attained, contracts for operation of facilities would be made with experienced private concerns, or with nonprofit distributing corporations.

Increased interest was displayed by foreign governments in the National Park system, and some indicated a desire to develop national parks in their own lands patterned after those of the United States. Much of this interest, no doubt, stemmed from the visits to U.S. parks and monuments by delegates who attended the United Nations conference in San Francisco, Calif. One session of that con-

ference was held in the heart of the Cathedral Grove of redwoods in Muir Woods National monument, near San Francisco.

In 1946, closing year of the decade, the 30th anniversary of the establishment of the National Park service as a bureau of the department of the interior was observed. As part of the celebration special exhibits were prepared and installed in park and monument museums to acquaint visitors with the history and development of the national park idea. Evening campfire programs, another feature of the National Park service's program of interpreting parks and monuments to visitors, were keyed to the 30th anniversary. The anniversary year marked the formal dedication of four units of the National Park system—home of Franklin D. Roosevelt National Historic site, Hyde Park, N.Y., on April 12, first anniversary of Pres. Roosevelt's death; Olympic National park, Wash., June 15; Isle Royale National park, Mich., Aug. 27; and Mammoth Cave National park, Ky., Sept. 18. (N. B. D.)

National Socialism

National Socialism was started as the Nationalsozialistische Deutsche Arbeiterpartei (N.S.D.A.P.) by Adolf Hitler in Germany in 1919. Its name revealed its emphasis upon nationalism, socialism, Germanism and the working class. Like Mussolini's fascism, it combined an appeal to nationalism and chauvinist expansionism with a revolutionary call to the masses.

Many traits were from the beginning common to fascism and national socialism, which may be regarded as the German form of fascism. Both proclaimed themselves the implacable enemies of liberalism and of individual rights; both stressed the subordination of the individual to the state, the inequality of men and races, the right of the strong to rule the weak, and the necessity of the principle of blind and unswerving obedience to leaders appointed from above. Both praised the military virtues, despised and rejected compromise, humanitarianism and charity, glorified hatred and conquest, and aimed at the transformation of the whole nation into an armed camp and an instrument of perpetual readiness for warfare.

But national socialism had its peculiarly German roots. They can be traced to the Prussian tradition as it developed under the inspiration of great soldier kings like Frederick William I and Frederick II and men of blood and iron like Bismarck. This tradition always regarded the militant spirit and the discipline of the Prussian army as the model for all individual and civic life. To it was added the tradition of political romanticism with its sharp hostility to rationalism, to the principles underlying the French Revolution, to the "superficiality" of the west, and with its emphasis on instinct, on the past, even on the remote past, and its proclamation of the rights of the exceptional over all universal law and rules. Thus the exceptional became a law unto himself. These two tradi-

Hermann Goering, under surveillance by a U.S. military guard, consulting his attorney Otto Stahmer during the United Nations war crimes trials at Nuernberg in 1946. Goering committed suicide on Oct. 16, a few hours before his scheduled execution

tions were later enforced by the 19th-century adoration of science and of the laws of nature which with their iron logic seemed to work out beyond all concepts of good and evil, and by a biological theory of life which led to the acceptance of racialism.

The peace treaty of Versailles gave to Hitler a starting point, but the violent opposition which he evoked was not directed in reality against the peace treaty but against the fact that Germany had been defeated and that its plans had been frustrated. From the beginning Hitler's propaganda appealed to the military circles, who regarded the peace only as a temporary setback in Germany's expansionist program. Hitler added to the pan-Germanic aspirations for world hegemony the almost mystical fanaticism of a faith in the mission of the German race and the fervour of a social revolutionary gospel. In the years of political and economic depression which followed Germany's defeat, Hitler's appeal to the German masses as the bearers of the most exalted racial ideals in the world was eagerly accepted to counteract their inferiority complex.

Though Hitler accepted many elements of the technique of the bolshevik revolution, he found a powerful ally in the widespread fear of bolshevism which he exploited, first in Germany and then on a world-wide scale, posing as the bulwark against bolshevism. On the other hand, he gained the adherence of the masses by promises of an anti-capitalistic order. The banner of the N.S.D.A.P. was the red flag of the revolution, but altered to the German imperial colours by the addition of a white circle and a black swastika in the centre. Thus Hitler combined the appeal of social revolution and that of a militant and mystical nationalism; the extraordinary flexibility of his

dynamic doctrine enabled him to stress different elements at different times and to adapt his attitude momentarily to changing circumstances, even with complete disregard for previous statements.

Hitler understood that, especially with as wide and far-reaching a goal as world domination, it was of the utmost importance to be able to present under one common denominator all potential adversaries who might themselves change according to the circumstances. "The art of truly great popular leaders in all ages has consisted chiefly in not distracting the attention of the people, but concentrating always on a single adversary. The more unified the object of the people's will to fight, the greater will be the magnetic attraction of the movement and the more tremendous its impact. It is part of a great leader's genius to make even widely separated adversaries appear as if they belonged to but one category, because among weakly and indecisive characters the recognition of various enemies all too easily marks the beginning of doubt of one's own rightness." (From Hitler's *Mein Kampf*, Houghton Mifflin.) It was a stroke of genius on the part of Hitler to find this common denominator in the Jews and in Judaism. This enabled him to discover the Jew behind all his changing adversaries, sometimes behind communism or Moscow, at other times behind Great Britain and the United States—in short, behind everybody and everything which at a given moment seemed to oppose his wishes or to arouse his wrath.

Working from these principles, Adolf Hitler was able to carry his party from its small beginnings in a beer cellar in Munich to a dominant position in world politics within 20 years. Among his more important collaborators were Alfred Rosenberg, the author of *Der Mythos des 20. Jahrhunderts*, the most widely read book of the national socialist movement besides Hitler's own *Mein Kampf*, and of *Blut und Ehre*; Rudolf Hess, who helped Hitler

write *Mein Kampf* during their internment in the fortress in Landsberg am Lech in 1924; Georg Strasser, probably the most important of Hitler's collaborators, who separated from him in protest against the leader's opportunist policies and was killed in the blood purge of June 1934; his brother Otto Strasser, who in 1930 founded the Black Front as a more radical wing opposed to Hitler; Gottfried Feder, who drew up the first program of national socialism and was for several years its economic "expert" before receding into oblivion; Capt. Ernst Roehm, the founder and organizer of the S.A. or *Sturm Abteilungen*, the national socialist militia, who was purged in June 1934; Julius Streicher, who became famous through his anti-Semitic weekly, *Der Stürmer*; Heinrich Himmler, the organizer and commander of the S.S. or *Schutz Staffel*, Hitler's personal elite guard, and of the gestapo (*Geheime Staats-Polizei*), the secret police; Josef Goebbels, the master of national socialist propaganda; Hermann Goering, the organizer of the German air force and controller of the German industrial mobilization; R. Walther Darré, the author of *Neuadel aus Blut und Boden* and organizer of the national socialist peasant policy; and finally Dr. Robert Ley, the leader of the German Worker's front.

It took 14 years for the N.S.D.A.P. to come into power in Germany. An intrigue, started by Franz von Papen, prevailed upon the aged president of the German republic, Marshal Paul von Hindenburg, to name Hitler chancellor on Jan. 30, 1933. The death of Hindenburg on Aug. 2, 1934, removed the last conservative obstacle. Hitler became *reichsfuehrer* and chancellor, the presidency was abolished, and all troops and officials were immediately forced to take the oath of fidelity to Hitler personally. The third reich was now to create the new order which, according to Hitler, was to last for 1,000 years.

But it was to be a new order of totalitarian dictatorship, sometimes called a "new" or "true democracy," not for Germany alone. Its dynamism was bound to expand and spread. By its own nature it could not recognize any limits of its own volition, only limits set by opposed superior force. The first years were spent in absolute concentration upon forging that instrument which would enable national socialism to establish its military and industrial superiority and thus to fulfill its ambitions. "Capitalistic" unemployment was abolished by a gigantic armament program. With mounting success, the aims grew in quick progression. The first aim was to unite all Germans within the reich on the basis of self-determination, which was proclaimed as the right of the German, but denied to other peoples. The next step foresaw the creation of a *Grosswirtschaftsraum*, or a *Lebensraum*, in which the German master race or *Herrenvolk* would rule over a hierarchy of subordinate peoples. The success of that plan widened it into the vision of a hemispheric order which would embrace all of Europe, western Asia and Africa, and finally of a world order which would establish the principles of national socialism, with its emphasis upon the Germans as the leading race, all over the globe. The extreme neomercantilism which received the new name of *Wehrwirtschaft* was accompanied by cultural autarchy, a resolute hostility against all western thought. The rejection of the west and its standards of justice, law and reciprocity led also to the proclamation of the official maxim that "Right is whatever profits the German nation; wrong is whatever harms it," which was regarded by Reichminister Dr. Hans Frank, the head of the Academy of German Law, in an address on Dec. 4, 1939, as the "beginning of national socialist justice."

National socialist parties existed outside of the reich everywhere where there was a population of German descent which national socialist agitation succeeded in organizing for its own aims. According to national socialist doctrine, loyalty to one's race or blood took precedence over one's loyalty as a citizen. Blood, and not a spiritual decision of allegiance, the doctrine taught, is the decisive factor. Wherever national socialist propaganda penetrated among people of German descent outside Germany, it tried to fill them with the same spirit dominant in Germany, and to create the same institutions and organizations. Thus the implacable fight against democracy, against the principles of the equality of all citizens and of equal justice for all was being carried directly into democratic countries. National socialism, which started as a purely German movement, produced by conditions and traditions peculiar to Germany, assumed after 20 years of incessant and successful struggle a world-wide importance, and bid to influence and determine the course of history on a world-wide scale. Confidently it entrusted its fortunes to the test of war. It lost, under the united pressure of the democracies and of the U.S.S.R., which Hitler had brought together by his attack on both; Germany was crushed; Hitler himself and his expectations of a millennium of German mastery were buried in the ruins of the fatherland.

National socialism which had started in 1919 ended 26 years later.

National Trust, British

The National trust, in no way state administered or financed, continued to carry on its work of acquisition and preservation of all that is of historic interest or natural beauty in England, Wales and Ulster, by members' subscriptions and donations. During the years 1937-46 it acquired some of the proudest possessions of the British people.

Considerable assistance was given to the trust's work in 1937 by the introduction of the National Trust bill, which provided for the co-operation of local authorities all over the country with the trust. This was followed by what became known as the Country House scheme, designed to enable a greater number of historic houses and estates to become vested in the trust. Freeholds were established over 4.5 sq.mi and covenants given over 1.1 sq.mi. Ulster properties featured in the trust's records for the first time in that year.

In 1938 one of the most perfect specimens of the "black-and-white" style in Great Britain, Moreton Old hall, Cheshire, was presented, with a fine collection of furniture. New freeholds were established over many fresh acres of land in, among other counties, Derbyshire and Cumberland.

The National trust had become comparatively rich in the possession of several unspoiled villages. A 1939 addition was Chiddingstone, Kent, consisting chiefly of houses dating from the 16th and 17th centuries. A freehold over 1.4 sq.mi. in the Dovedale and Manifold valleys, and many

266 acres in Westmorland also came to the trust in that year. Covenants came, too, over large tracts of beautiful country in Westmorland, Cumberland and Devon.

In World War II a large number of its properties were requisitioned, and its agricultural and other lands were quickly harnessed to the war machine, both as food-producing and battle-training areas.

Some interesting comparative figures with Aug. 1914 emerged at war's outbreak in 1939: number of properties held, (1914) 63, (1939) 410. Total square mileage: (1914) 9.1, (1939) 92.

Square mileage protected by covenants (1914) 2 ac., (1939) 42.2.

In spite of the administrative difficulties engendered by World War II, new properties still came to the National trust: in 1940, 2.1 sq.mi. freehold and 6.3 covenanted sq.mi. In 1941 new acquisitions constituted a record increase and included Lord Lothian's bequest of his 7.1 sq.mi. Blickling, Norfolk, estate.

In 1942 more than 25 sq.mi. of freehold properties also came to the trust, the most noteworthy being Sir Charles Trevelyan's gift of his 20.3 sq.mi. Wallington estate, Northumberland, the largest single property thus far accepted. In 1943 came Lord Astor's gift of Cliveden, Buckinghamshire, the Hon. Mrs. Ronald Greville's Polesden Lacy, the Pilgrim trust's generous £10,000 toward the purchase of Avebury, Sir Courtauld Thomson's Dorneywood and Sir Richard Acland's Holnicote and Killerton estates in southwest England.

West Wycombe park, Buckinghamshire, came to the trust in 1944 from Sir John Dashwood, and in the same year Gunby hall, Lincolnshire and Flatford mill, Suffolk, famous for John Constable's "Haywain," were also presented.

Illustrating the voluntary nature of the trust's work, Nottinghamshire Miners' Workmen's Allocation fund, by donating £1,000 in 1945, assisted the public appeal which finally purchased Nottinghamshire's 5.9 sq.mi. Clumber park and lake.

Osterley park, near London, presented to the British nation through the trust in 1946 by the earl of Jersey, became a playground for Londoners.

Important 1946 landmarks were the handing over to the trust of Charlecote park, Stratford-on-Avon, the home of the Fairfax-Lucy family since the 12th century, and the presentation to the nation, through the trust, of Winston Churchill's house, Chartwell.

The year 1946, with the administration of its more than 900 properties again reaching normality, also saw an unusual increase in the properties of the trust. This was because of the inauguration of the National Land fund whereby the state accepted lands in lieu of death duties and the treasury was reimbursed by money from the land fund. While the National trust did not in any way gain financial state aid under this scheme, it began to be possessed for the first time of properties of historic interest and natural beauty from other than purely voluntary sources.

To celebrate its jubilee the trust launched a nationwide appeal for more members in 1946. Membership increased by between 4,000 and 5,000 and contributions amounted to £62,467. (See also DONATIONS AND BEQUESTS.)

National Youth Administration

Created by executive order of Pres. Franklin D. Roosevelt June 26, 1935, the National Youth administration was terminated July 3, 1943, by act of congress. During the eight years of existence it operated its program successively within three federal administrative structures. During the first four years it was a unit within the Works Progress administration; for a little more than three years it was a division within the Federal Security agency and for nine and one-half months it was a part of the War Manpower commission.

The major objectives of the NYA were stated early in its work and remained fundamentally unchanged throughout the life of the agency. They were:

- (1) To provide funds for part-time employment of needy school, college and graduate students so that they could continue their education.
- (2) To provide funds for part-time employment on work projects of young persons, the projects being designed primarily not only to give these young people valuable work experience but to benefit youth generally in the community.
- (3) To establish and to encourage the establishment of job training, counselling and placement of youth.

During the eight years of its operation a total of \$662,300,000 was expended, of which \$467,600,000 went for the payment of wages of out-of-school youth and \$169,500,000 went for the payment of wages of young people in high school and institutions of higher learning. This expenditure of federal funds enabled the employment of 4,800,000 young people, of whom 2,700,000 were given work experience and training on work projects producing useful goods and services, and 2,000,000 were school, college and graduate students on work in public and semipublic nonprofit institutions.

Administratively the NYA was set up with a national office and a state office for each of the 48 states and the territories. Below the state levels there were offices in all of the larger cities and of groups of counties, based upon population. Citizen committees were established at the national, state and local levels. At the time of the Pearl Harbor attack there were 2,500 citizen committees functioning in the NYA. It was the function of these citizen committees to assist in the selection of projects for the employment of youth, to assist in securing local resources to match those available from the federal government and to develop suggestions for the development and servicing of youth in the local community, at the state level and at the national level.

The out-of-school work projects were divided into two large groups: (1) work projects where the youth lived at home; and (2) resident projects where the youth lived in dormitories and did work in shops and upon farms, etc., at the residence or nearby.

Five hundred odd resident projects operated by NYA provided youth with a basic work experience in group living and democratic self-government. The youth built the resident centres, shops, made the furniture, salvaged the heating and cooking equipment, made their own clothing, cooked their own food, washed their clothing and raised most of what they ate.

The nonresidential work projects were the largest of the programs of the NYA. They built 3,700 schools and

reconstructed or improved 25,600 others. They also built hospitals, recreational and community service buildings, housing projects, roads, bridges and armouries; they made clothing, shoes, radio receiving sets, interoffice communication sets and all forms of light arms and munitions.

The school work was carried on in 29,000 high schools and 1,600 colleges and universities. The NYA workers made up just short of 10% of the college enrolment and approximately 3% of the high school student enrolment. The work which the students performed included: construction, repair of building apparatus and equipment, machinery and automotive work; landscaping, reforestation and soil work; health, sanitation, hospital clinical assistance; clerical and stenographic assistance; library assistance; home economics assistance, etc. (See also EDUCATION.) Naval Academy, U.S.

The decade 1937-46, during which its 100th anniversary was celebrated, marked a period of unprecedented activity at the U.S. Naval academy in Annapolis, Md. During this period 6,923 regular midshipmen were graduated. Of this number 4,303 pursued the shortened course in effect during the war years; 3,735 naval reserve midshipmen inducted in 12 groups were given intensive engineering training. Other groups of reserve officers were given short intensive indoctrination courses. To provide instruction for this expanded student body, more than 350 reserve officers, retired regular officers and civilians were brought to the academy as instructors. The summer practice cruise, abolished during the early war years, was resumed in 1944. In the summer of 1946 the first and third classes went to sea aboard the battleships "North Carolina" and "Washington" and the second class, aboard the carrier "Randolph." In addition a full-scale amphibious operation of two weeks' duration was carried out with the second class cadets of the military academy. Further co-operation with West Point was accomplished by the exchange of visits between the midshipmen and cadets, debates between the two academies, exchange professorships and conferences between the superintendents, commandants and department heads of both institutions. Many curriculum changes were made in the light of war experience.

In Nov. 1945 a department of aviation was established for the purpose of indoctrinating every midshipman in the fundamentals of naval aviation. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. S. CR.)

Navies of the World

By 1936 it was already evident that the complex structure of naval limitation embodied in the various treaties stemming from the Washington conference of a decade and a half previous had broken down; and that the last day of the year, which saw those treaties expire, would fail to see them renewed in any form whatever. It is true that as the new year of 1937 rang in, a conference was sitting in London to extend those treaties. But the Japa-

nese delegates to that conference were repeating with a parrot-like insistence the mystic phrase "common upper limit," which signified that they would accept no treaty which did not restrain the U.S. and Great Britain from building warships while they themselves were allowed to build. Their behaviour in China and Manchuria had not been such that the western powers could accept the dialectically fair Japanese proposal with any feeling of confidence that the interests of peace would be served. They did not accept. The document that resulted from the conference was accordingly signed only by the U.S., Britain and France; and it was so shot with exceptions, exemptions and escalator clauses that it became a dead letter within two months of signing.

The naval architects of the world were now free to consult strategists instead of diplomats in determining what ships to build.

All found much building to do because, with the exception of the new navy of fascist Italy, the world's fleets of the key date were largely composed of ships that were either relics of World War I or had been designed with the conditions of that war in mind. Yet amid this craving for the new it was remarkable how the three major sea powers (U.S., England, Japan) and the four of second rank (France, Italy, Germany, U.S.S.R.) clung to the old; how thoroughly the new designs reflected the rejected treaties, even where those treaties were honoured only by being broken.

Prewar Trends

Naval thought everywhere, with an exception to be noted, was still under domination of the idea of decisive action as achieved by a long line of battleships engaged against another as they had been at Jutland and back to the days of Lord Anson. The most pressing need felt by British, U.S., Italian and French navies was for the renewal and speeding up of the battle line. Yet the battleships laid down by all four nations, "King George V" class in England, "North Carolina" class in the U.S., "Littorio" in Italy, "Richelieu" in France, were treaty ships—that is, they remained within the treaty gun calibre limit of 16-in. and the treaty tonnage of 35,000. The British ships, indeed, employed a main battery 2 in. smaller in diameter, and this was a political rather than a technical specification; for at that final, failing conference the British had sought to have the smaller gun written into the treaties as the maximum permissible. In those days, despite the clouds rising round the horizon, many people in England still believed in what President Hoover called "Disarmament by example."

In other respects all the new battleships showed a moderate adhesion to the doctrine that air power had come of age, in the form of considerable numbers of small automatic weapons for close-in work and in mounting their secondary, medium-calibre guns in small turrets for high angle use, instead of in battery, as the earlier custom had been.

Most pulled their superstructures together to clear upward fields of fire for these pieces.

The French and Italian vessels added a third, heavier calibre of medium pieces, indicating they expected to be attacked by large surface torpedo craft at night or under smoke. Again, in the ships of all four countries, the increased complexity of fire control instruments brought about the suppression of the mast in favour of elaborate control towers, many levels high. All the ships were

much faster than any earlier vessels in their respective navies, in response to analysis which showed that most of the fighting in the previous conflict had been done by the rapidly moving battle cruisers. Yet this increased speed was relative. The Italian ships, built for a running and raiding war in the Mediterranean, were nearly 20% faster than the heavily armoured U.S. vessels, which were expected to cruise the immense distances of the Pacific, fight gunnery actions at the limits of the world and return as much as 3,000 mi. home in battle-damaged condition. The British ships, as is usual with British ships, spent much of their tonnage in sea-keeping qualities not reflected in figures. Only the Italian vessels, intended to work under cover of land-based air, were without ship-board planes.

Outside these generalizations lay the pairs of battleships (all the nations built their first new battleships in pairs) produced by the aggressive axis powers, Japan and Germany—"Yamato" class for the former, "Bismarck" class for the latter. Japan had denounced the naval treaties and was under no juridical compulsion to build a treaty ship; nor did it. But it is interesting to note that the "Yamatos" were the subject for lively debate in the imperial naval staff, one faction maintaining that since the treaties had expired there was no point in continuing the effort to produce small numbers of individually better warships which had been the product of the treaties. The need in the war with the U.S. which had already been determined upon would be for more numerous ships in which technical excellence received only secondary consideration. Partly this view was a product of that quasi-mystical confidence in *Bushido*, fighting spirit, which underlay so much of Japanese military thinking, but which the high command was not yet willing to accept in all its implications; so this viewpoint did not triumph.

The "Yamatos" were designed as more-than-treaty battleships, with a tonnage exceeding 50,000 and nine main guns of a calibre of 18.1-in., which would give them a superiority over the "North Carolinas" both in range and penetration. In view of the attention Japan itself was devoting to aviation, it was somewhat surprising that the possibility of U.S. air attacks on these ships was not given more attention; of major anti-aircraft weapons of 5-in. calibre "Yamato," received only 12 ("North Carolina" had 20 and "King George V" 16), while a good deal of tonnage went to provide a battery of twelve 6.1-in. for beating off the large, heavily armed U.S. destroyers.

The Japanese ship thus resembled the Italian in armament and may be described as a heavy, long-range vessel for a raiding war as the latter was a heavy, short-range vessel. This view, though something of an oversimplification of Japanese strategy, was reinforced by the fact that at the same time there were laid down six semi-battleships, the "Chichibu" class, which were raiders pure and simple. These ships, rumours of which caused an enormous amount of excitement and mystification, were developments of the "pocket battleships" built by Germany under the treaty of Versailles. They were designed for six 12-in. guns, armour proof against the artillery of any cruiser afloat, and for enormous speed.

While the Japanese were imitating Italy in one part of their major ship design and Germany in the other, the Germans were copying themselves. "Bismarck" was little more than a modernization of the final World War I design for a German capital ship, the never-completed "Ersatz Yorck." There was the same main armament, eight

15-in. guns in twin turrets fore and aft, the same secondary armament of twelve 5.9-in., the same elaborate armour protection, both internal and external. Indeed when the ship sailed the crew were informed she was quite literally unsinkable. She differed from the World War I ship only in having the modern control tower, the secondary armament in turrets instead of battery, the increased speed achieved by the use of modern boiler equipment, a powerful anti-aircraft battery both of heavy (4.1-in.) and automatic weapons and increased protection against torpedoes. "Ersatz Yorck" had been designed for more than 35,000 tons; the extra features in "Bismarck" consumed a good deal of additional weight, and under the 1935 Bilateral Treaty with England which permitted the re-establishment of the German navy as a major force, it had been agreed to accept the 35,000 ton limit. All this did not in the least worry Herr Hitler. "Bismarck" and her sisters (there were to have been five more) were expected to fight England anyway and he accurately estimated that he would have no war with the British until he gave it to them. The ships were of 43,000 tons and were much superior to their British opposite numbers.

* * *

THE EXCEPTION to the view that naval power in the future as in the past could be reckoned in battleships was taken by Japan. There were indeed individuals and groups elsewhere who disagreed with the traditional view. In England the first lord of the admiralty was forced to submit, along with the estimates for new battleships, a statement in which he said it was quite possible that the air arm had outmoded the ancient weapon but that if Britain adopted the new without positive proof the old had been superseded, it might well have lost the world. England did provide for carriers in its new naval program, as did all the other sea powers except Italy, but only in Japan were they regarded as the major implements of sea power, and only because of the circumstance that found Japan planning war against a nation so superior in resources for building the normal type of warship. In Japan before World War II practical politics was a military function and the lines of political cleavage were with regard to military policies. Admiral Isoroku Yamamoto, advocate of naval aviation, had been powerful before the expiration of the treaties. With that event and the news that President Roosevelt had secured funds for the construction of a U.S. battleship fleet which Japan could hardly hope to match, he became almost omnipotent. His concept of the defense of an empire stretching 50° from China to the Marshalls (including the territory Japan expected to seize) was that of land-based aviation operating from island fields in such force as to prevent the incursion of an enemy fleet. The function of attack and counter-attack would be confided primarily to similar planes from carrier decks, landing on new fields among the islands as soon as they were taken during an advance.

The result was that carrier operations were assigned a high priority in both construction and training, as something in which the Japanese could obtain superiority over the U.S. before the latter became aware of it. The construction of both the "Yamatos" and "Chichibus" was delayed. Japan's adoption of a sensibly smaller type of carrier than that used among the western nations reflected military conditions less than the fact that the Japanese were willing to live aboard ship under conditions that

Navy Day, New York city, 1945, with aircraft carrier "Enterprise" in foreground

Americans would find intolerable, and the fatalistic Japanese view that after an action they would either possess a piece of land on which to set down the planes for which there was inadequate room on the decks, or the planes themselves would not return.

Two new carriers ("Soryu" and "Hiryu") had been the last items on the Japanese program under the treaty structure. Two new, larger and much better protected units ("Shokaku" and "Zuikaku") were laid down immediately and a still larger one ("Taiho") the following year. As the inevitable war approached, the hulls of two big passenger liners were taken over and converted to the carriers "Hitaka" and "Hayataka," while a pair of fast auxiliaries were converted to the carriers "Shoho" and "Ryoho."

At the same time, even in Japan, where the concept of carrier war had been pushed further than anywhere else, it was realized that there would be occasions when these ships would find themselves at a disadvantage—night, fog or heavy seas, for example. It was necessary to protect the carriers at such times from the attacks of surface vessels. The Japanese were not worried about attack by American battleships—their carriers could run too fast for any danger from such a source—but they respected the powerful heavy cruisers built by the U.S. navy as a result of the treaties, and it was against these that they provided.

* * *

THE JAPANESE were satisfied that their own heavy cruisers of the "Atago" and "Nachi" classes, built under the treaties, were superior to the U.S. types. Indeed they should have been, being nearly 2,000 tons above the treaty limits, which the U.S. had observed so scrupulously that most of their vessels in the class were 1,000 tons less than the prescribed 10,000. A method for Japan to obtain the desired ships had already been foreseen. When the London conference of 1930 extended the treaty limitations to cruisers and called a halt to the construction of heavy (8-in. gun) ships, it permitted the building of more light (6-in. gun) ships within certain tonnage limitations. Japan had 51,000 tons available for construction and announced that it would put it into six cruisers of 8,500 tons apiece, the "Mogami" class, mounting fifteen 6.1-in. guns in five turrets.

The first of these ships had already been seen afloat when the treaties expired and though she looked extraordinarily big from a distance, foreigners were not allowed aboard. Questioning the good faith of another nation on visual evidence was considered international bad manners. Actually the "Mogamis" were of nearly 15,000 tons. As soon as the treaties expired the Japanese sent the first two ships of the class to dock with some story that their stability needed looking after and replaced the fifteen 6.1-in. with the ten 8-in. guns for which the ships had in fact been designed. The second pair of units ("Kumano" and "Suzuya") were built with 8-in. guns *ab initio*, and carefully faked photographs were distributed to the press, showing them with three smaller guns to a turret instead of two large ones.

For the third pair ("Tone" and "Chikuma") two of the 8-in. guns were dropped. The novel arrangement of placing all the rest on the forecastle was adopted, the whole after portion of the ship being occupied by an immense hangar which permitted the use not only of more planes than in those used by cruisers of other nations, but also

of longer range types. The "Tones" were destined for the scouting wing of the Japanese fleet; but like their predecessors they carried no less than 16 torpedo tubes firing the remarkably large and powerful 24-in. torpedo. The Japanese believed firmly that cruisers would often be found in close action at night, where torpedoes would be of great importance.

This view was by no means shared in the U.S., where torpedo tubes had been removed even from the cruisers originally possessing them. U.S. naval doctrine held to the theory of the concentration of function, diversity in a fleet being procured by bringing together the various specialized ships that would supply the elements necessary for an operation. It was a theory that only a wealthy navy could afford, but under the Roosevelt administration, with war-clouds darkening in Europe and the East, the U.S. navy was so wealthy that it could have practically anything it wanted. As long as the treaty restrictions remained it wanted new cruisers.

It received nine of the latter, 10,000-tonners with fifteen 6-in. guns and great radius of action, the "Brooklyn" class. These units proved so successful that the next cruiser class (the "Cleveland"), laid down after the war in Europe had already begun, had only slight modifications, chiefly in the direction of increased anti-aircraft guns. They were given twelve 5-in. guns instead of the 8 possessed by the "Brooklyns," and room was made for these by suppressing one 3-gun 6-in. turret. Protection remained approximately the same, and as in most U.S. cruisers there were sacrifices of speed as compared with the ships of other nations.

At the same time four small light cruisers of a special anti-aircraft type ("Atlanta" class) were provided to lead destroyer flotillas and furnish cover for carriers. They had sixteen 5-in. guns and a number of automatic weapons, but nothing larger.

In view of this interest in anti-aircraft work, it was somewhat surprising to find that the U.S. navy's enthusiasm for carriers during the years after 1936 was very temperate. After the small carrier "Wasp," already building at the expiration of the treaties, only one more carrier ("Hornet") was begun till after France had fallen—though it is just to remark that congress was extremely reluctant to extend the American naval air arm, and even in voting for "Hornet," refused to provide her with planes. "Hornet" herself was large, commodious and fast, and there existed aboard a perfection in minor technical detail, such as arrestor gear, which few other nations could even approach. In accordance with American ideas at the time she was very lightly armed (eight 5-in. plus a few automatics), it being considered that the function of a carrier was to lie at a distance on the unengaged side of a battle line and fly her planes over.

She would seldom come under any but an aerial attack in such a case, and against this it was the duty of other ships to protect her. The idea of the carrier task force, later so important, was still only a matter of discussion among a few enthusiasts.

In Britain there was less reluctance to undertake carrier construction, one being built between the breakdown of the treaties and the beginning of the war; four more were on the ways at the latter date. All were conceived on lines completely different from those adopted in Japanese and U.S. carriers. They had approximately the same tonnage as the latter, 23,000; but on this tonnage they carried far fewer planes and twice as much anti-aircraft artillery (sixteen 4.5-in. plus more than double the American complement of automatics.) Their most individual

feature was a flight deck armoured heavily enough to withstand all but the largest bombs. By the time they were laid down the Austrian and Czech aggressions had made it probable that Britain's next enemy would be Germany or an Italo-German combination. These carriers ("Illustrious" class) were built for such a war, where they would expect to be operating in the North sea or western Mediterranean, directly under the shadow of enemy land-based air power, which meant they could expect repeated hits from air attack.

The same concept of a war against the European axis appeared in British cruiser construction. England had never been particularly happy with the 8-in. gun heavy cruiser type, and her designs in the field were far from successful. English insistence at the London conference of 1930 on writing restrictions against such ships into the treaty was, in effect, a rationalization. The admiralty had already determined that the heavy cruiser was too wasteful of the tonnage which could be used to obtain a larger number of smaller ships—necessary to protect extended British trade routes against raiders. The designs prepared for the 1933 program ("Southampton" class) were originally for quite small ships, armed with only eight 6-in. guns.

Before they were built there was news that the U.S. "Brooklyn" and the Japanese "Mogami" would have 15 such pieces. Southampton was accordingly expanded to a 12-gun 8,500-tonner with the explanation that she was a "reply" to those large ships. The statement was somewhat disingenuous. The admiralty was already looking across the North sea, where Hitler had come into power and had built a series of remarkable light cruisers in which, by the expenditure of much money and great refinement of detail, nine 6-in. guns were mounted on a ship of little more than 6,000 tons ("Königsberg" class.) There were not many of these, but it was an old axiom in a naval war that it takes four defenders to hunt down one raider and that to be an effective counter-raider the defending ship must outgun the corsair. In the first British post-treaty cruisers, "Colony" class, the twelve-gun armament was preserved, though the tonnage was still further dropped to obtain more units at the sacrifice of some cruising range and armour.

At the same time a large series of anti-aircraft cruisers similar to the U.S. "Atlantas" was laid down. Their tonnage was even less than that of the U.S. ships (5,500); they were supplied with ten 5.25-in. guns and given speed enough for flotilla work, either as leaders or in beating off destroyer attacks. Both Germans and Italians were building large, powerful destroyers, and contacts with these could be expected.

In view of this preoccupation with the lighter units of potential enemy forces it seemed surprising that England should have given so little attention to the heavy ships Hitler began to build under the Bilateral treaty of 1935, which permitted him to build up to 35% of the British forces in each class. The battleships he laid down have been mentioned. Two of the other units were carriers which never really came into the service, partly because German inexperience in constructing the type caused them to be delayed, partly because of the determined opposition of the luftwaffe authorities to all but a sub-surface navy. The characteristics of these carriers ("Graf Zeppelin" class) showed the odd confusion of German naval thinking. One would think it obvious that a carrier, as a ship for fleet operations, should be intended to strike from a distance by means of her planes. The moment she entered a gunnery action she would cease

to be able to handle planes and the primary reason for her existence would disappear. But the Germans produced a carrier in which much of the tonnage was expended to fit her for operation as an individual ship and for close gunnery action. "Graf Zeppelin" was of approximately the same class as the U.S. "Hornet" and British "Illustrious"; she had nearly the same anti-aircraft armament as the British ship (twelve 4.1-in.) and facilities for the same number of planes. But the tonnage which in "Illustrious" gave a stout armoured deck and in "Hornet" capacity for nearly twice as many planes, was expended by the Germans on a heavily armoured belt and the more-than-cruiser armament of sixteen 5.9-in. guns, enough to give her a good deal to say even to "Brooklyn" or "Mogami" in a gunnery duel and clearly to outmatch the British "Southamptons" and "Colonies."

Perhaps this could be referred to the megalomaniac cult, rampant in Nazi Germany, of having everything stronger than that possessed by neighbours. The five heavy cruisers of the "Bluecher" class seemed to exhibit the same mental background. In form they were reduced editions of "Bismarck" with the eight 8-in. guns mounted like the battleship's 15-in. Like "Bismarck" also they were cheats; the actual tonnage was upwards of 15,000 instead of the 10,000 permitted by the treaty. But this huge tonnage was largely expended in characteristics only secondary in military value for cruisers, such as elaborate torpedo protection, internal bulkheading and duplicate control stations. In actual fighting power the German ship was well below both the U.S. heavy cruisers and the Japanese and was only a little better than the British "Berwicks," produced a decade and a half before.

* * *

JUST BEFORE the outbreak of World War II the Russians began an effort to rebuild their long-neglected navy, but the only units above a destroyer they produced were the first numbers of a large class of "heavy" cruisers, the "Kirovs," sufficiently remarkable ships which excited no imitators. Italian help was called in on the design, and the mixture of ideas produced a ship of 7,800 tons with great speed, little protection and elaborate minelaying equipment. The principal oddity was the main armament of nine 7.1-in. guns, a calibre neither heavy enough to deal with an 8-in. gun cruiser nor firing fast enough to handle a 6-in. gun ship in close action under conditions of low visibility. The Soviets wanted heavier pieces—the ships were originally designed for six 8-in.—but lack of technical experience in the gun factories and the obvious near approach of war caused them to accept whatever could be had most quickly.

They were somewhat happier with their destroyers, of which two main series were produced—the "Leningrad" class, on which French designers collaborated, and the "Stremitelnis," under Italian influence and for which a kind of pilot model ("Tashkent") was built in Italy. Both "Tashkent" and "Leningrad" were such big ships (more than 2,800 tons) as to be armourless light cruisers rather than destroyers. This was in accordance with the Russian theory of war that all matériel and personnel should be considered expendable provided adequate damage was inflicted on the enemy. When features commanded by Russian preoccupations, such as mine chutes and ice-breaker bows, had been incorporated in the French design, "Leningrad" turned out to be very wet and rather top heavy. The

"Stremitelnis," on much less tonnage, proved extremely successful, since their drawbacks of poor protection and low fuel capacity were not those that counted in the restricted waters of the Baltic, Black sea and White sea, where they were used. In later units of the "Leningrad" class one of the five 5.1-in. guns with which they were originally armed was removed, bringing them down to the same armament of the "Stremitelnis"; the boiler and funnel arrangements were altered and a hybrid Russian type was thus produced, which really combined the best features of both the others.

It was no accident that sent the soviets to Italy for designs in which fuel capacity and protection were sacrificed to speed. The *Regia Marina* had been building such ships for many years before the end of the treaties, and the expiration of those documents had for Italy only the effect of erasing the paper lines between cruisers and destroyers and permitting the construction of the 12 "Regolos." They were the only ships aside from battleships, some of the "normal" four-gun, six-torpedo tube destroyers and a few submarines, built by Italy during the period between 1936 and the war. They were extremely interesting as original craft on a tonnage of 3,300, which clearly took them out of the destroyer category while leaving them below the normal light cruiser level. They were armed with eight 5.3-in. guns and eight torpedo tubes, more than a match for any destroyer afloat but not nearly enough to take on the smallest cruiser, especially as they were unprotected. The always skilful Italian mechanical engineers endowed them with a speed well over 40 knots. They were, in fact, the ultimate development of the Italian theory of a running and raiding war in the Mediterranean under shore-based air cover—ships which could cut a convoy to pieces unless it was protected by heavy units, or dash in on it while its major escort was concerned with the larger Italian ships.

They were also in a sense replies, and intended to be crushing replies, to the over-sized French destroyers, of which 32 had been built in a line extending back to the middle 1920s. The French ships were all very similar, all mounting five 5.5-in. and six to nine torpedo tubes on tonnages which gradually grew from 2,000 to 2,800. All were very fast ("Terrible" made over 45 knots), intended for counter-raiding duty against destroyers in the Mediterranean. France was not moved to improve on the type by the construction of the "Regolos." The fact was that she could not afford to. Thanks to the rebirth of the German navy and the somewhat equivocal political attitude of Britain, her naval leaders had been forced to contemplate a war in which she would be alone or with Russia against the European axis, and to orient the French building program accordingly.

One result of this was the speed, really remarkable for French constructors, made with the two "Richelieus"; another was the laying down of the first French post-treaty cruisers, the "De Grasse" class. They had the same tonnage as the British "Colonies," but nine 6-in. guns instead of 12, the tonnage thus saved being used for a strong belt of armour which made these ships considerably superior both to Hitler's light cruisers and to the feebly-protected Italians. All the other French prewar construction showed the same duality of outlook. French strategists seemed to have been more exercised by the reappearance of the German submarine service than by almost anything else during those troubled years, and their concern was expressed in a large program of two types of destroyers. One was the "Hardi" class, a "fleet destroyer" on 1,700 tons, with six

5.1-in. guns and seven tubes (the new Italian destroyers had four 4.7s, the new Germans five 5-in.). The other type was a small destroyer for escort work, the "Fier" class of less than 1,000 tons, with four 3.9-in. and four tubes. Remembering that submarines had proved the most efficient of all antisubmarine craft in World War I, the French also laid down a large number of submarines, mostly small.

The British were actuated by somewhat the same ideas in destroyer construction. As the treaties went out of force and Hitler's Germany began building submarines again, England was continuing her "alphabetical" series of destroyers, building one nine-ship squadron a year, with only minor improvements between each group and the next follower. Now they suddenly leaped to two squadrons a year and in addition laid down a large series of "Hunt" class destroyers, much resembling the French "Fiers," with somewhat less speed and tonnage and lacking torpedo tubes. As replies to the big continental destroyers there was also produced a class of sixteen "Tribals"—destroyers in which the emphasis was on gunnery equipment rather than torpedoes. That is, they were small, armourless cruisers along Italian, French and Russian lines, but conceived in a somewhat different spirit. The "Tribals" had eight 4.7-in. guns for their main armament. The British produced a smaller ship than those abroad by cutting the torpedo tubes to four, holding that size was not desirable in ships so completely without protection that the first salvo would put them out of action in any case. The "Tribals" were a modern version of the classic British doctrine of obtaining quick, smothering fire against an enemy.

* * *

UNITED STATES and Japanese destroyer design of the period preceding the war lay beyond the reach of these European influences. The first post-treaty U.S. destroyers were the "Sims" class of 1,570 tons, on which they carried five 5-in. guns and 12 tubes. This, superficially, was not much different from the French "Hardis," the British "J-K-Ns" (last of the prewar alphabeticals) or the German ships. The next, very large U.S. class ("Benson") was outwardly even more like the European types because the tonnage went up and the number of torpedo tubes was reduced by two, the "Sims" class having proved deficient in stability. Actually U.S. destroyers had little in common with the European designs. They were intended to accompany fleets to the limits of the Pacific and possessed a fuel capacity that would have been absurd in a European destroyer. They had more freeboard and far less top speed (33 knots was the most that could be expected from many of the "Bensons"), though if it were a question of traveling 1,500 mi., the U.S. ship would probably arrive first.

The Japanese destroyers of the period, which belonged to the "Asashio" class or developments of it, extracted considerably more in the way of military qualities from tonnages only slightly higher. Their cruising range was little inferior to those of the U.S., they were at least five knots faster all along the line, they added an extra gun (making six 5-in.) and mounted eight tubes for the 24-in. Japanese torpedo, which had nearly double the explosive force of the U.S. 21-in., besides being compartmented to a degree far beyond the U.S. ships. It was a fine achievement of design, but not even Japanese ingenuity could get such qualities for nothing; as in other ships, the item sacrificed was habitability in the western sense of the term. Much later, when some of these ships became prizes of war, American sailors were on the verge of mutiny when asked to live and work in the overcrowded, hot, ill-ventilated spaces which the Japanese treated as normal, though some-

thing less than a third of the number of American sailors was needed to handle the ships, since they were not sailing on military missions.

As with destroyers, there was a marked difference in submarine design between the Atlantic and Pacific powers. The smallest submarines built by the latter during the post-treaty period were the two 800-ton U.S. "Mackerels," an experimental type kept on training duty because it was lacking in endurance and habitability for active service. They were larger than the largest German boats, the 740-ton "ocean going" "Type IX," and almost as large as the largest "patrol" submarines built by England, the "T" class. The small size of the German submarines was partly due to a conscious effort in that direction through refinement of detail, since the Germans believed that small size and handiness were of great value in enabling a U-boat to escape her pursuers. Partly it was once more a question of living quarters, on which the Germans skimmed almost as much as the Japanese.

But the true determining factor was range, the distances to be covered in the Pacific.

French submarines were notable as being the only ones that retained deck tubes, on the theory that a submarine should be used at night on the surface. The submarines of all nations contained far less automatic machinery, far fewer devices than the submarines of World War I. Every naval nation had discovered independently that in submarine war personnel failures were far less numerous than mechanical failures, and it was safer to leave the flotation of a submarine torpedoboat in the hands of a man watching a dial than under the control of a machine.

Minor navies of the period produced nothing of special interest with the exception of a series of large Dutch destroyers for East Indian service, each carrying an aeroplane. This type of ship generally had grown into a small unprotected cruiser.

These, then, were the ships built from 1936 to the outbreak of the war and the ideas that lay behind their construction. Except in Japan, naval thinkers were under the domination of the idea that battle was the function of a line of battleships. Except in Germany, designers held that raiding was the function of light, fast surface craft. The whole concept of amphibious war lay in the future. Though a few officers had discussed the idea that the modern capital ship had become so large, so agile and so able to turn her guns in any direction that the line of battle was a thing of the past, there was no evidence that the idea of the overmastering importance of the aeroplane had ascended from the level of an argumentative point to that of a serious conception. The plane was considered a distinct menace, but the belief was that its influence would be to drive ships even farther from the coast than mines, submarines and improved coastal artillery had done in World War I.

The early months of World War II tended to confirm the last conclusion, though on lines completely different from those which had caused it to be drawn.

Effect of Naval Actions, World War II

In the Norwegian Campaign and the retreat from Dunkirk the British destroyer service was nearly broken up, with 87 ships heavily damaged or destroyed. The effect of these losses on naval construction was hardly less important than in the fields of politics and strategy. The ships had gone down chiefly under the attacks of German shore-based dive-bombers, and it became clear that the defense of light ships against this form of attack was wholly inadequate, both qualitatively and quantitatively. There were

several cases in which planes feinted attack till the ships had used up all their ammunition before sinking the now-helpless craft. There were many instances in which the attackers passed rapidly through the high-altitude zone where the destroyer's main battery was effective and discharged their bombs from a range which the ship's machine-guns were incapable of reaching. On the other hand, there proved to be comparatively little need for destroyers in their function as torpedo carriers accompanying a battle line.

The months following Dunkirk (June 1940) were for the royal navy a period of frantic search for better automatic weapons, finally discovered in the Swedish Bofors 40 mm. and the Swiss Oerlikon 20 mm. The early models of both guns were imperfect (the 40 mm. lacked any system of fire control) but the need for anti-aircraft defense was so acute that major alterations were made in the remaining destroyers of the alphabet class to permit their installation. The majority of the ships had been designed for four guns and eight tubes. When they left the builder's hands after refit they had only two guns in the main battery, and one bank of four tubes had been removed. In place of one of the forward guns a fire control station, equipped with radar, loomed; down either beam appeared three 40 mm., with 20 mm. scattered about the superstructure. The remainder of the weight saving went into ammunition supply for the light pieces.

The 50 World War I destroyers received from the United States underwent similar basic alterations, and the later units of the alphabet ships—O to Z classes—though larger than their predecessors, carried but four guns in their main battery and often had one bank of torpedo tubes replaced by a single 4-in. anti-aircraft piece, while automatic weapons were grouped around the bridge and on a superstructure well aft. The "Hunts," most of which were not completed till after Dunkirk, received a 4-barrelled 40-mm. pompom mount similar to those placed on the larger ships.

But they were less frequently in action against aircraft than against submarines, since by the time they appeared the battle of Britain had been fought, and it was clear that German over-water aviation had been incompetently handled, both as to construction and tactics. The emphasis of the naval war shifted, and the shift revealed that the admiralty had made a tactical error with regard to the submarines quite as gross as the technical error with regard to the effects of air attack on light ships. In the period between wars England had greatly developed sonic and supersonic devices for locating submarines under water. It was assumed that once the trail of a U-boat was taken up the result would be reasonably certain. This by no means proved to be the case. The Germans had also studied sonics. They had dampening devices of more or less efficiency and had discovered that currents and temperature gradients often nullify the effect of the detection devices. They used these facts with the greatest skill; moreover their submarines were so much faster than World War I models that they were able to run ahead of a convoy, lie in wait along its track and attack on the surface at night, under which conditions sonics were of little value.

The effect was to create a demand for large numbers of escort vessels, and this demand became acute just as the depletion of the British flotillas at Dunkirk made it most difficult to meet. To a certain degree the need had been foreseen. In World War I, more than 700 Allied destroyers had been engaged against German submarines, which

never numbered more than 60 at sea at any one time. Even at the outbreak of World War II it was evident that the Germans would have far more submarines and the Allies far fewer destroyers. The "Hunt" class destroyers and some slightly slower vessels called "sloops" had accordingly been laid down in numbers when the war broke out.

The alarming losses among convoy ships in 1942 made it clear that it would take too long to build adequate escorts in these classes, and the admiralty undertook the construction of large numbers of the most important British ship type of the war—the corvette. The corvette represented only minor variations from the commercial fishing trawler of large size. She was under 900 tons displacement, armed with a single 4-in. gun and a 40 mm. pompom, was cheap and rapid of construction; the speed of 15 knots, though low for a warship, was adequate for convoy duty. More than 300 were built in England, many more in Canada. Their construction was halted only when improvements in submarines and the availability of better machinery units and building yards made larger, faster escort vessels both necessary and possible. The new class, described as "frigates," could be considered either as enlarged corvettes with turbines that drove them at 21 knots, or as reduced "Hunt" class destroyers. More than 150 of them were built.

Simultaneously with these frigates (early in 1943) there began to appear on the sea-lanes another type, also denominated frigates in the royal navy, but in the U.S., the country of their origin, called "destroyer escorts." These were less built-up trawlers than they were cut-down destroyers, with the advantages of having been conceived as military ships from the beginning. There were five different types of destroyer escorts, all essentially similar. They ranged from 1,100 tons to over 1,400; mounted for the most part three torpedo tubes and three 3-in. guns, a two-barrelled 40 mm. (alternately a 1.1 mount rejected by one of the cruisers) and six 20 mm. Some of the early units had no torpedo tubes and some of the late ones two 5-in. guns

instead of three 3-in. Their speed was 21 or 26 knots, according as they were diesel- or turbine-propelled.

By the time they were being produced, both the hedgehog and mousetrap antisubmarine devices were in use, and all the destroyer escorts had one or the other, which they used with great effect. One of them, U.S.S. "England," actually sank six Japanese submarines in as many days. They were built from standardized parts by true mass production methods, many at places as far inland as Pittsburgh and the Great Lakes. More than 1,000 were ordered and 662 were actually built, 84 for British account, 4 for France and 6 for Brazil. The remainder of the program was cancelled toward the middle of 1944 with the effective domination over German and Japanese submarines.

It would be inaccurate, however, to describe either British or American escort vessels as those which actually broke down the submarine war. All the types thus far named were essentially defensive in function; only the turbine-propelled destroyer escorts could catch up with a large German submarine on the surface. The great success of the antisubmarine war was achieved through the co-operation of a variety of units, but chiefly those which took the counteroffensive in "hunter-killer groups." These sought out submarines and attacked them after securing a clew to their whereabouts by means of radio detection finding or aerial scouting. The United States commonly used destroyers or destroyer escorts as the surface units of such groups; the British normally employed the 30 "Black Swan" class sloops of 1,400 tons, which had better sea-keeping qualities and more powerful armament (six 4-in. guns) than the frigates.

The determining element of these hunter-killer groups was not furnished by any such vessels but by the aeroplane, and specifically by the aeroplane as flown from a class of ships unknown when the war began—the escort carriers. The first ("Long Island") had been a large diesel-engined passenger-freight ship in the U.S. merchant marine. She was taken over by the U.S. navy in March 1941 when a

The "Wasp," third U.S. aircraft carrier lost during World War II, was sunk by Japanese torpedoes on Sept. 15, 1942, off the Solomon Islands

U.S. navy landing craft, supported by battleships, cruisers and destroyers, beaching supplies on western Okinawa in April 1945

United States involvement in the war had become a probability. The importance of the aeroplane had been revealed by this time, and it was evident that even with the utmost speed of construction, no new regular carriers would be completed for as much as two years.

A flight deck was built above her hull, from which the upper works were cut away, and a few automatic weapons were installed.

In spite of her low speed it proved possible to operate planes from her deck, and 14 similar ships were immediately undertaken for England under the lend-lease arrangement, partly conversions from existing hulls, partly new hulls built to standard maritime commission design. Several were already in service before the Pearl Harbor attack. They proved an instant success, furnishing air cover for convoys through those regions of the Atlantic where it was impossible to give such cover from shore. They rendered practically impossible the favourite submarine tactic of assembling ahead of a convoy by forcing the U-boats to remain submerged during the daytime and, as radar was installed on the planes, were even able to counterattack submarines after dark.

The escort carrier program was stepped up throughout 1943 and 1944, with several firms mass-producing hulls and machinery. A whole line of additional escort carriers was converted from large fast tankers, whose fuel capacity made them especially useful. By spring of 1943 their effect on the submarines was so serious that the Germans recalled all those at sea, rearmed them with a number of automatic weapons, and ordered them to remain on the surface and fight matters out when attacked by planes instead of submerging as they had done earlier. In all, 124 U.S. escort carriers were built, 38 for England in addition to 4 the latter nation built for itself.

Later in the war escort carriers were employed both to take planes forward across the reaches of the Pacific to the fast carriers operating at its western rim and to furnish air support for amphibian operations. In the latter function they were so successful that the U.S. marine corps (in

charge of such operations in the United States) made them a permanent part of its organization. Japan also built in the escort carrier category late in the war. The ships were not a success, but this appears to have been due to operational inefficiency. Britain built flight decks across the normal superstructures of 19 large oil and ore carriers without installing hangars below or changing the commercial character of these vessels.

These last improvisations would hardly class as warships, but the U.S. navy achieved an extremely successful improvisation in the true carrier class in 1942 from the hulls of nine incomplete light cruisers. They had been intended as units of the "Cleveland" class, which was expanded to number 32 after the passage of the "two-ocean navy bill" and the proclamation of a national emergency following the fall of France in 1940. In the early combats of the war, American carrier losses were severe—at one time the fleet had only a single functional carrier. Eleven large carriers had been authorized by the bill, but only three were actually under construction in 1942, and it would be well into 1943 before the first of these could join, while the escort carriers were too slow and vulnerable for high speed combat operations.

Nine of the cruiser hulls were accordingly converted to light carriers, the first of them, "Independence," arriving in the Pacific simultaneously with the first of the large carriers.

In spite of apprehensions about stability and narrow decks, they proved a success from the beginning, no ships in the Pacific war seeing more action or rendering more service. Several became special night fighter ships with the duties of protecting the large areas after dark. As the conflict ended they had acquired a definite place in the total economy of the fleet as the cruisers of the carrier category. Two more units, built not on cruiser hulls but as carriers from the keel up, were under construction for the U.S. navy in 1946 and no less than 12 for the British.

The principal units built into the large carrier class by the U.S. navy during the conflict were the 24 vessels of the "Essex" type. They were developments of "Hornet" on 4,000 more tons, the extra displacement going into radar equipment and greatly increased batteries of light anti-aircraft weapons, 40 and 20 mm. Thirty-two of the former were provided in the original design. Under attacks from shore-based planes and especially the suicidal Kamikazes in the latter days of the war, this proved insufficient and eight more 40s were added, mounted on sponsons below the island on the starboard side.

These were the ships which, more than any others, carried the war to the shores of Japan. But eight of the twelve 5-in. guns had been mounted fore and aft of the island superstructure in twin turrets and the arrangement did not prove satisfactory. When the guns were fired across the deck, even at a considerable angle of elevation, the blast effect on any aircraft there was destructive. They also proved somewhat tender under attack—"Essex," "Bunker Hill," "Ticonderoga" and "Franklin" of the class were all so badly damaged that they were brought home with difficulty, the last not even by a Kamikaze but by a pair of bomb hits. The weakness of American carrier decks was not in fact a defect while these ships were being used on the lines of their original conception, remaining at a distance from an enemy who was approached only by their aircraft. But the actions of 1944-45 had shown it was not only possible but strategically necessary to take carriers close up to inimical shores where they could overwhelm

Correction of these defects was the main design change in the "Midway" class of carriers, the first three of which were completing just as the war ended. The main battery guns, a new type 54 calibre 5-in. of high velocity, were mounted singly in sponsons beneath the edge of the flight deck, and the deck itself was heavily armoured after the British fashion, a precaution which paid dividends to that nation during the conflict, when three of the armoured British carriers were crashed by suicide planes without being put out of action. In displacement the "Midways" were of 45,000 tons, nearly twice the size of "Essex." The leap was actuated less by the desire to get more planes aboard ("Essex" could carry as many as 120 in an emergency) than by the necessity of providing a long, wide and steady flying platform for the new two-engined bombers and fighters. England undertook a similar class of large carriers ("Malta" class), but the first of these had not yet entered service by the close of 1946.

The only other nation to undertake carrier construction during the war was Japan. The immense U.S. program, which between 1942 and 1945 gave that nation alone more carriers (without counting the escort carriers) than all the rest of the world's navies combined in 1940, was no secret. During the first year of the Pacific war Japanese carrier losses were even more severe than American. Before the close of 1942, the two big seaplane tenders "Chitose" and "Chiyoda" were taken in hand for conversion to carriers. The developing naval crisis of 1943 made it evident that this measure was not nearly sufficient. Japan was so short of steel that more carrier decks could be obtained only by cutting down elsewhere. All six battle-cruisers of the "Chichibu" class, on which construction had proceeded only languidly, were accordingly converted to carriers, as was the only heavy cruiser Japan laid down during the war. The remaining battleships of the "Yamato" class (there were to have been six) were cancelled and the light cruiser building program was reduced both in individual

size and in total numbers. The effort was unavailing—only two of the new carriers got to sea and they were promptly sunk by U.S. submarines. The ships apparently possessed no features of special interest.

The form of oceanic warfare introduced by carriers had far more influence on characteristics of other types of ships than on those of the carriers themselves. The effect of the German dive-bombers on British light ship construction has been mentioned; but down to Dec. 1941, there was no sign that similar effects would be exercised on large ships. Only two armoured vessels had been sunk from the air in 29 months of war. One of these was a light cruiser lying in harbour, already suffering from a torpedo wound inflicted by a submarine; the other was a reconstructed Italian battleship caught at anchor without her batteries manned. The damage against similarly unready and static ships at Pearl Harbor might have been explained away. But there was a shock of the first order in the destruction of the British "Repulse" and "Prince of Wales" off Malaya in Dec. 1941 by unaided Japanese planes. Means of preventing a repetition of this result received first priority with all the naval constructors of the world.

* * *

THERE WERE numerous survivors from the "Repulse"- "Prince of Wales" tragedy, and the reasons for the loss of the two big ships, aside from the tactical fact that they lacked air cover, early became clear. The heavy anti-aircraft weapons (5.25-in.) could not be fired fast enough to eliminate dive-bombers and torpedo planes pressing home to a close-in attack, and the lighter weapons were neither numerous nor accurate enough. It was on a large scale the same defect that had brought the downfall of the destroyers off Norway. While airmen of at least the Japa-

The giant carrier U.S.S. "Franklin," aflame and listing from the hit of a Japanese dive bomber on March 19, 1945, during operations against the Japanese navy in the Inland sea. Although more than 1,000 casualties were suffered and the carrier was all but sunk, she struggled back across the ocean to the east coast of the United States under her own power

The U.S. carrier "Yorktown," veteran of Pacific naval operations, pulling into San Francisco bay in 1945. Its impressive scoreboard included 695 aircraft destroyed and 153 ships sunk

nese and U.S. navies had been carrying the development of dive-bombers and torpedo planes to a high point, the battleship men had consistently refused to consider anything but high-level bombs. The impact on the U.S. navy was more severe than it was anywhere else. The Japanese were sunk in the self-satisfied concept that they were the only people who knew how to deliver this form of attack while the British were not immediately called upon to deal with it again.

The U.S. light automatic weapon of the period was the quadruple mounted 1.1-in., a thoroughly bad piece, firing too light a shell to stop a plane until it had delivered its blow and suffering from grave mechanical defects. Experiment with the 40 mm. had continued (under the personal inspiration of President Roosevelt, it was said); it was now pushed forward apace. The upper works of the four later units of the "North Carolina" class battleships were so completely redesigned as to make them into a new type, the "South Dakota" class. In these ships everything above decks, including the control tower, was massed in a pyramidal superstructure around the single funnel, with light automatic weapons not only on all available deck space but on the steps of the structure as well—twenty-four 40 mm., thirty-two 20 mm. in the original version, a figure later increased by mounting still more such guns atop the turrets. The result was that in the Battle of Santa Cruz in Oct. 1942 "South Dakota" not only preserved herself from injury in a fierce air attack, but also shot down 32 of the 33 bombers attempting to attack the carrier she was pro-

tecting. The older U.S. battleships were radically altered to accommodate similar equipment, and through the remainder of the war no ship was sunk from the air while guarded by a battleship.

In the four battleships of the "Iowa" class, built during the war, the tonnage had been sent up to 45,000 to obtain greater speed and better protection with the same main battery. More deck space permitted anti-aircraft armament to be carried even further than in the "South Dakota." They were given no less than 124 light weapons. It is possible that the six British battleships of the "Lion" and "Vanguard" classes laid down at the beginning of the war might have turned out somewhat similarly, but Britain's need for light craft to combat submarines was always so pressing that both steel and builders' time were wanting for the completion of these ships. Moreover, there seems to have been considerable mind-changing and argument about the armament of these vessels, which also had the effect of slowing construction. The "Lions" were originally designed for nine 16-in. guns and the "Vanguard" class, at least for some time, to carry twelve 14-in. When "Vanguard" herself, the only one completed, appeared she mounted eight 15-in. All the others were in a state of suspended animation.

Japanese cruiser construction during the war was limited by the fact already mentioned to the four ships of the "Agano" class, mounting six 6.1-in. guns on 6,000 tons, and employed chiefly as stiffening for torpedo flotillas. In fact, as the war drew nearer the shores of Japan in 1943 and 1944, the torpedo became more and more the major weapon of that power. Several of the old but still quite fast "Kuma" class light cruisers were altered to mount no

less than 28 tubes, 24 of them firing the new large torpedo, the ships being bulged out along the strakes to carry them. Two series of heavy destroyers were produced, the larger of them ("Terutsuki" class) quite big enough to stand comparison with similar Italian ships as unprotected light cruisers. On a tonnage above 2,500, these ships mounted eight 4-in. guns and carried four torpedo tubes of the large size. The remaining displacement went into the engine room and resulted in a speed of well over 40 knots, which the Japanese vessels could maintain for a considerable period of time while the Italians could not. The other line of destroyers, the much more numerous "Takanamis," were slightly smaller and more nearly normal in design, mounting six 4.7-in. guns and eight large tubes, with a speed well in excess of that developed by U.S. ships of the class. Late in the war another new type of Japanese destroyers, the "Matsus," began to appear. They were throwbacks as to military characteristics and size, having only four guns with varying numbers of tubes, and were much simplified ships designed for quick construction to replace the heavy destroyer losses Japan had suffered.

Fuel capacity and the increasing amount of radar and fire control gear left most war-built U.S. destroyers sensibly lower in top speed (though still not in cruising speed) than their contemporaries built elsewhere. After Pearl Harbor, the 5-gun, ten-tube "Bensons" began to undergo some of the alterations which had appeared earlier in British craft. Two main types of revision were made; in one, one of the 5-in. guns was removed in favour of automatics; in the other, a bank of five torpedo tubes was lost. Additional new equipment eventually brought most of the class to the sacrifice both of a gun and a bank of tubes and left the

"Bensons" inferior in fighting power to the Japanese ships they might encounter in the Pacific.

The possibility had been realized before the event occurred, and a new design was prepared; most of the destroyer building yards continued to turn out "Bensons" until prefabricated parts for the new series became avail-

able. The latter were the "Fletchers," of which 175 were built. It was a 2,100-ton flush-deck design with five 5-in. guns, ten tubes, four 40 mm. and six 20s. These were the standard U.S. destroyers through most of the war. An attempt was made to improve the type in the 70 "Sumners," of which the first units appeared in 1944. They were slightly heavier than the "Fletchers" and had six 5-in. guns paired (an arrangement to which U.S. gunnery officers objected) in order to make room for twelve 40 mm. (two quad mounts and two twins) which were felt to be necessary in view of the increasing intensity of Japanese air attacks. These destroyers had the same power plant as the "Fletchers." The extra weight made them both slower and less economical of fuel, the latter to such an extent that the design was altered to produce the "Gearings," which were "Sumners" 15 ft. longer, with the extra space devoted to fuel.

Numbers of the "Bensons" had their tubes removed and were converted to fast minesweepers for work in Japanese waters toward the close of the war. A squadron of "Sumners" was altered to light minelayers. After the Japanese began to use suicide bombers another alteration was made in both destroyers and destroyer escorts. This produced the "picket boat" with all torpedo tubes removed and replaced by still more light anti-aircraft weapons and radar.

The suicide bombers brought alterations of the same type in both U.S. and British cruisers. The original numbers of the U.S. "Atlanta" class possessed sixteen 5-in. guns, 12 in double turrets on three decks fore and aft, with a wing turret on either beam. The original British "Didos" had ten 5.25-in. Later "Atlantas" lost the wing turrets, which were replaced by 40 mm. quadruple pompoms, and the later "Didos" sacrificed one of their turrets to similar pompoms. In the British service the "Swiftsure" class of cruisers, which immediately followed the "Colonies," preserved the hull form and tonnage of the earlier ships and obtained the desired anti-aircraft fire power by suppressing one main battery three-gun turret, which resulted in a nine-gun ship like those in continental navies. The U.S. solution in cruisers above the "Atlanta" size was to increase the over-all displacement rather than reduce the main armament of a standard tonnage ship.

The "Clevelands" had space and weight carrying capacity sufficient to permit them to be armed with sixteen 40 mm. and a large number of 20s with only a very slight increase of tonnage. The later numbers of the large class (there were ultimately 29) had these small pieces written into the design. In all a consistent effort was made to reduce superstructure and silhouette, the last two of the class ("Fargo" and "Wilmington") being one-funnel ships. In the succeeding "Worcester" class, under construction at the close of the war, the tonnage was sharply jumped to 14,000, an extraordinary figure for a "light" cruiser and one comparable with the 13,000 tons of the U.S. war-built heavy cruisers, the "Baltimores."

Like the ships that preceded them, these had a main battery of nine 8-in. guns, but the secondary armament had jumped to twelve 5-in., and the first ships of the class were completed late enough (1943) to receive the full impact of the air war, so they were given sixteen 40 mm. and twenty-eight 20s. There was difficulty about the turret mechanism

of the new model high-angle 8-in. guns mounted; it was nearly a year before the next numbers of the class appeared (priorities for carriers and destroyers were also responsible for the delay). At this time the light armament was still further increased and the displacement moved up another 1,000 tons. After 16 of the class had been built a still better 8-in. gun was developed, capable of rapid fire. It was made the main armament of the new 17,000-ton "Des Moines" class, only two of which were carried through to completion after the close of the war.

The most remarkable cruisers produced for the U.S. navy were the "Alaska" class of 27,000 tons, originally intended to fill the wide gap which had appeared between the capital ship of 45,000 tons and the cruiser of less than one-quarter that size, and to perform heavy duty functions more economically than could be undertaken by either of the others—such as handling the Japanese "Chichibu." The designs had been prepared in 1939 and authorization for the ships was secured in 1940, but none was actually laid down till immediately after the Pearl Harbor attack, when the general U.S. strategic situation was so poor that it seemed not unlikely the United States might be forced to conduct a raiding war. These were seen as the heavy raiders for such a war. They mounted nine 12-in. guns behind good protection and had a turn of speed sufficient to keep them away from battleships. Three of these ships were built; two of them saw service in the Pacific. There was no longer anything for them to raid by the time they were completed, but they did duty as carrier guards and for one ("Guam") it was claimed that she shot down more Japanese planes than any other ship.

Sweden built two small light cruisers with seven 6-in. guns and a host of anti-aircraft weapons. No other nation produced ships above a destroyer during the war, though it is perhaps worth remarking that Brazil, becoming a naval building nation for the first time, constructed seven ships in the destroyer class.

When the war began, the soviet union was building at least two battleships in the atmosphere of secrecy usually surrounding the naval undertakings of that nation, but both were bombed out or blown up on the stocks during the German invasion. In fact, except for some of the large destroyers operating in the White sea, Russian ships hardly justified their design during the conflict. There were supposed to be nearly 200 Russian submarines when Hitler plunged across the borders, many of them of the small "Malodky" type, designed in the one direction for rapid production at inland factories and in the other for operation by small crews in restricted waters. There was no record of any accomplishment by these craft. The Japanese did better with diminutive submarines. Their midget craft with two-man crews, carried on larger submarines, entered Pearl Harbor on the day of the attack there. After this date they became ineffective, though they might have done more had the conflict been prolonged. More than 500 had been built toward the end of the war, and the Japanese intended to use them as suicide boats in beating off the invasion.

British, Italians and Germans all imitated the tiny Japanese craft, the first two with notable success, each succeeding in torpedoing an enemy battleship in harbour by means of two-man submarines. The German-made submarines were of four different designs—the 1-man "Biber" and "Molch" types, the 2-man "Seehund" and 18-man "Walterboot." It was characteristic of German methods and strategy that all were being withheld for the assembly

of a large number of craft when the war came to an end.

There was no such delay about the employment of the large German submarines, but neither was there any particular originality of design, the various type numbers mainly reflecting minor variations of machinery and armament.

An interesting type was produced in 1942, a 1,600-ton supply submarine, carrying ten days' supplies for ten cruising submarines.

At the very end of the war the Germans brought out another new class in the "Type XXI" submarine with underwater speed high enough to permit it to escape escort vessels while submerged.

Like all German submarines from the middle of 1944 it was fitted with an air tube called the *Schnorkel*, which allowed it to operate on diesels while under water.

The "Type XXI" never received adequate combat tests.

Like the Germans, the Japanese used many of their larger submarines for supply purposes, and in support of their isolated island bases toward the close of the war. They even diverted to this purpose the two monstrous submarine aircraft carriers they produced, with a hangar deck capable of accommodating six planes. These craft were of nearly 5,000 tons, the largest submarines ever built, but they were complete failures, slow in diving, unhandy and sluggish of movement.

As with submarines, other naval craft throughout the war tended to erase the boundary line between warships and auxiliary vessels. The British grain and ore carriers with flight decks have been mentioned. Many U.S. and a few Japanese destroyers were converted into light, fast armed transports. In 1944 there were added to the list of the U.S. navy more than 300 "attack transports" and "attack cargo ships" for beachhead work. These were large sea-going ships, to be clearly distinguished from the various types of landing craft; but they mounted armaments of 5-in. and lighter guns that made them equal or superior to a destroyer in fighting power.

They were intended not only to protect themselves from aerial attack during an operation, but also to cover by their fire the movements ashore of the troops they carried until a beachhead was thoroughly established. (F. Pt.)

Nebraska

One of the states formed from the Louisiana purchase, Nebraska lies in the lower Missouri valley in the west north central part of the United States; admitted to the union in 1867. Area 76,653 sq.mi.; water area 584 sq.mi. Population (1940) 1,315,834, a decrease of 62,129 from 1930; 39.1% was urban. About 1% of the population was Negro and about 8% foreign-born, principally German and Scandinavian. Capital, Lincoln (81,984). On July 1, 1944, the bureau of census estimated the population at 1,213,792.

The principal state officers for 1937-41 were: governor, R. L. Cochran; lieutenant governor, Walter H. Jurgenson (succeeded by W. E. Johnson); auditor, William H. Price (succeeded by Ray Johnson); secretary of state, Harry R. Swanson; treasurer, Walter H. Jensen (succeeded by T. W. Bass and John Havekost); attorney general, Richard C. Hunter (succeeded by W. R. Johnson); superintendent of public instruction, Charles W. Taylor.

In the election of Nov. 1940, Dwight Griswold became the new governor. In the presidential election of that year, Willkie received 352,201 votes and Franklin D. Roosevelt 263,677.

Alone among the 48 states Nebraska continued to have a one-house legislature, the 43 members chosen for two-year terms on a nonpartisan ballot.

Griswold was re-elected governor Nov. 3, 1942, for the term 1943-45.

Other state officers elected for 1943-45 were: lieutenant-governor, Roy W. Johnson; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Carl G. Swanson; chief justice, Robert G. Simmons.

On Nov. 7, 1944, Griswold was again re-elected governor, for the term 1945-47. Other state officers in 1944 were: lieutenant governor, Roy W. Johnson; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Carl G. Swanson; superintendent of public instruction, Wayne O. Reed; chief justice, Robert G. Simmons. The vote for president in 1944 was: Thomas E. Dewey, 329,880; Franklin D. Roosevelt, 233,246.

The legislature of 1945 enacted laws providing for more liberal unemployment benefits, introducing retirement systems for municipal and school employees, adjusting county salaries and setting up machinery for the comprehensive regulation of aviation. The legislative council was authorized to initiate or continue extensive investigations of electric power, irrigation and water utilization, public school organization and finance, municipal financial practices and the legal status of life insurance companies. Edward Gillette replaced Carl G. Swanson as state treasurer.

Val Peterson, Republican, was elected governor Nov. 5, 1946, for the term 1947-49. Other state officers for 1947-49 were: lieutenant governor, Robert B. Crosby; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Edward Gillette; state superintendent of public instruction, Wayne O. Reed; chief justice, Robert G. Simmons.

Negroes, American

The eventful decade 1937-46, spanning the United States' greatest external crisis, produced great shocks and transformations in the life and status of the nation's greatest minority group—the more than 13,000,000 Negroes (12,865,585 in the 1940 census), numbering 9.8% of the total population.

Checked at many points by continuing discrimination, galvanized at others by the general momentum of social

change, affected most of all by its own increased inner dynamic of group struggle and progress, American Negroes in those years achieved larger net gains than in any other period of their history.

Outstanding among these gains were: (1) a considerable intersectional population shift, aggregating much more than 3,000,000, northward and westward from southern centres under the stress of rural depression and expanding war and peacetime industry; (2) a rapid urbanization at twice the general population rate, by which more than 6,500,000 Negroes became resident in urban communities, north and south; (3) maintenance of these footholds in the new centres, even during the years of the depression, largely because of the New Deal programs of public works and public relief; (4) marked improvement of educational, civic and economic conditions over the previous ones, in spite of the handicaps and increased tensions of overcrowded and restricted residence areas in many cities; (5) rapidly accelerated participation in community activity, self-help, business and professional life through voting, first in the city centres north and midwest, but after the supreme court decision outlawing closed white primaries, in all the southern states; (6) considerable advance to new industrial employment and to the semiskilled and skilled levels of such industries, indicated by a wartime peak of 1,250,000 Negroes, estimated by the War Manpower commission as 7.2% of total war industry employment, with 15% in the skilled categories; at the same time, federal employment of Negroes rose from 8.4% to 12.5% with an estimated 50% increase in upgrading; (7) inclusion of Negroes in the ranks of organized labour that brought their numbers to an estimated 1,500,000 unionized workers; (8) rapid educational progress, as indicated by the reduction of illiteracy to about 10%, increase of secondary school enrolment from 157,515 in 1937 to more than 300,000 in 1946, while the number of college students increased in the same period from 22,045 to 53,030 without counting substantial recent G.I. registration figures; (9) active participation in the cultural arts, which brought manifold recognition to a rapidly expanding number of Negro writers, artists, actors, singers, composers, scholars and research scientists (*see below*); (10) a new stature and scope for Negro leadership both in Negro and interracial organizations engaged in constructive programs of race relations and general social progress, including even southern liberal organizations like the Southern Congress for Human

Negro membership in U.S. labour unions rose to an estimated 1,500,000 during the decade 1937-46. Negro and white seamen are shown here applying for work as deck and engine hands at the National Maritime Union hiring hall in New York city

Welfare, the Society for the Abolition of the Poll Tax, the Farm Tenants' union and the like.

Chronology of Developments.—In 1937 wide-scale organization of Negro workers was launched by the steel workers' and the garment workers' unions, also by the automobile workers' and the mine workers' unions under the Congress of Industrial Organizations. The Southern Farm Tenants' union also held its first meeting with 150 white and Negro delegates. The Farm Tenancy commission, with two Negro members, inaugurated the government program for farm resettlement of sharecroppers and under federal auspices, model low-cost housing was extended to a number of urban Negro areas, among them Atlanta, Ga., Jacksonville, Fla., Louisville, Ky., Atlantic City, N.J., Philadelphia, Pa.

In 1938, in the case of *Lloyd L. Gaines vs. Missouri*, the U.S. supreme court ruled that unless a state provided equal educational facilities for Negroes, the regular state schools must be opened to Negroes. The decision, not immediately implemented, gave great impetus to larger educational provisions for Negro education on the part of several states. The same court also affirmed the right of Negroes to picket against racial discrimination, and New York state passed an antidiscrimination civil rights bill. The Southern Conference for Human Welfare adopted at its Birmingham, Ala., meeting a broad human rights and resources development program for the south, without discrimination. The Farm Security administration began a remedial program following the National Resources committee's report that the average income of Negro families was less than half of the general average and that the southern averages were even lower. Negro migration from the rural south continued apace, since by then three-fourths of these farmers had become tenants or sharecroppers. The national Y.M.C.A. celebrated the 50th anniversary of work among Negroes in honour of its first general secretary, William Alphaeus Hunton. Arthur Mitchell was re-elected congressman from the 1st Illinois district, and Crystal Bird Fauset became the first Negro woman member of the Pennsylvania state legislature.

During 1939, under the influence of the Gaines decision, Morgan college, Baltimore, became a state college. Duke university in North Carolina began to participate in extension teaching at North Carolina State College for Negroes, and budget expansions began in almost all of the 19 separate state agricultural and mechanical land-grant colleges. On 14th amendment pleas, equalization suits for teacher salaries won in Maryland, lost in Virginia, but were appealed. The National Labor Relations board ordered mandatory wages instead of gratuities on the plea of the Brotherhood of Red Cap Porters.

Farm tenant evictions caused grave disturbances in Arkansas, Missouri, Oklahoma, but provoked liberal support for rural reforms; peonage suits were instituted in some cases.

Marian Anderson, who had been refused a concert by the Daughters of the American Revolution at Constitution hall, Washington, D.C. (the ban was later lifted), gave an Easter Sunday concert at the Lincoln Memorial under the auspices of a distinguished committee and was later awarded the Spingarn medal for 1939. The 25th anniversary program of the American Society of Composers, Authors and Publishers gave a special concert tribute to W. C. Handy and James Bland. George Washington Carver was awarded the Roosevelt medal for achievements in horticulture and industrial chemistry. Mayor Fiorello La Guardia appointed Jane Bolin a N.Y. municipal judge and Myles Paige to the special sessions bench of the criminal court. In the uni-

Marian Anderson singing at Constitution hall, Washington, D.C. in Jan. 1943, where the audience was seated without segregation at the singer's request. One of the greatest contraltos of her day, Miss Anderson drew packed concert audiences throughout the decade 1937-46

fication of the Methodist Episcopal Churches North and South, two Negro bishops were elected; the first encyclical of Pope Pius XII called for social justice and racial amity.

In 1940 the U.S. supreme court refused to review the *Alston* case circuit court order to Norfolk, Va., to cease teacher salary differentials based on race; salary equalization was agreed to in Louisville, Ky. The National Association for the Advancement of Colored People won its 17th victory in the supreme court *Hansberry* decision outlawing a Chicago real estate restrictive covenant, without passing on the general constitutionality. In the pressures of war preparation, a revised policy of the army was promulgated after a White House conference, and on Oct. 25, 1940, Col. Benjamin O. Davis, Jr., was promoted to a brigadier general and army quota restrictions on Negroes were lifted. Antidiscrimination clauses were attached in congress to bills authorizing aviation and vocational defense training.

The absorption of the Negro into industry from the ranks of unemployment and relief began.

In July 1940 the 75th anniversary of emancipation was celebrated in an exposition with state and federal subsidy in Chicago, and in December the anniversary of the 13th amendment was commemorated by an exhibition and festival at the Library of Congress.

The National Urban league and the Association for the Study of Negro Life and History celebrated their 25th anniversaries.

Under war pressures in 1941 aviation training was initiated for Negro cadets at the Tuskegee airfield, a non-discrimination order was issued for all war defense proj-

ects and finally, in June 1941, President Roosevelt issued the order on fair employment practice, forbidding racial discrimination in industry under war contracts. The supreme court reversed the adverse ruling of the Interstate Commerce commission refusing to compel railroads to provide equal accommodation for Negroes. Equalization of teacher salaries was ordered in Delaware, Kentucky and Maryland, and suits began in eight other states. War industry migration began heavily among the rural Negro population, and disorders broke out in several urban centres like Chicago, New York and Detroit into which they were pouring. Adam C. Powell, Jr., was elected to the New York city council. Harvard university protested the athletic exclusion policy of the naval academy and voted to discontinue athletic relations with schools having such policies, whereupon Navy broke its custom by playing Cornell with Sam Pierce on the Cornell team.

In April 1942 the U.S. navy relaxed its limited quotas for Negro personnel and initiated a large training centre, Camp Robert Smalls at Great Lakes, Ill., and at Hampton, Va. The first Negro marine corps units were activated, the first tank corps and the 93rd division at Fort Huachuca, Ariz., and the 92nd at Fort McClellan, Ala. Gradually, though in separate units except officer candidate schools, the Negro began to get proportional representation in the armed forces. Before selective service, Negro volunteer enlistment rates were 16.1%, nearly double the population ratio. National guard units joined the first expeditionary units over a wide area—Great Britain, Ireland, North and West Africa, Australia, New Guinea, Hawaii. Acute training camp tensions, caused primarily by segregation policies, were finally eased by the appointment of Negro military police and special race-relations officers, but the policy was generally resented and protested by soldiers and civilians alike. The National Maritime union, with an

Negro fliers practising the Morse code as part of their training on the campus of Tuskegee institute, Ala., first U.S. army air school for Negroes. Five young lieutenants, the first to graduate, received their wings March 7, 1942

integration mixed-crew policy, had uniform success, as symbolized by giving a Negro captain, Hugh Mulzac, command of the "Booker T. Washington" with a mixed crew. Dorrie Miller, heroic messman of the Honolulu attack, was awarded the navy cross in recognition by Adm. Chester W. Nimitz, after much public controversy.

Numerous companies were cited under the Fair Employment Practice act in 1941, but gradually fair practice extended itself, especially where C.I.O. unions were in control; although American Federation of Labor policies began to broaden under pressure.

New York state, the War Production board and the War Manpower commission issued nondiscrimination orders; salary equalization for schools was extended to six more states. The supreme court declared the Georgia contract labour law unconstitutional.

In 1943 the Negro service quotas reached the population ratio, with 700,000 men in the army, 5,000 officers, 74,000 men in the navy, 4 pursuit and 1 bomber squadrons in the air forces and token representation in other branches. The 99th pursuit squadron participated creditably in the North African, Sicilian and Italian campaigns, winning citations under Col. Benjamin O. Davis, Jr., and his successor, Maj. George Roberts. Other combat units and many quartermaster and transportation units saw heavy action and received group and individual citations; but there was controversy over the setback of the 92nd division in the Leghorn campaign. Final investigation cleared the troops and placed blame on the higher command.

Resistance to fair practice caused the Committee on Fair Employment Practice to be reorganized twice, and necessitated a re-enforcing presidential order. Eventually, the Negro industrial quota was raised from 5.3% to 7.3% in war industry. War labour migration reached 800,000 with a rough gain of 500,000 in new job employment. Riots in Mobile, Ala., Beaumont, Tex., New York city and a very severe one, June 20-22, in Detroit, alarmed the country;

more than 100 interracial committees were organized to counteract these tensions in various parts of the country.

William H. Hastie was awarded the Spingarn medal in 1943, after resigning as civilian aide to the secretary of war in protest at the continuance of army segregation; his successor was Truman Gibson, Jr. Francis Rivers was chosen a city court justice in New York, and James W. Johnson became collector of internal revenue there.

By 1944 Negro enrolment had reached 701,678 in the army; 425,000 overseas; 148,769 in the navy; 5,707 marine corps; 3,556 coast guard. The navy broke precedent by admitting Negroes to officer commissions, with 28 ensign and lieutenant appointees and admission of Negro women to the WAVES. The F.E.P.C. estimated 1,334,000 war job placements. The U.S. supreme court (*Lonnie Smith vs. Texas*) declared the closed white primary unconstitutional, restrained unions from debarring Negroes from membership and seniority where they had exclusive bargaining rights and outlawed as peonage the Georgia contract labour law for debt. The California supreme court outlawed auxiliary unions for Negroes, declaring closed unions incompatible with closed-shop bargaining rights. New York state passed the Quinn-Ives bill against discriminatory practice in industry. In Philadelphia a protest strike of streetcar employees against the upgrading of Negroes was broken by government intervention. William Dawson was elected to congress from the 1st Illinois district, Adam C. Powell from New York city. Georgia abolished the poll tax and many additional Negroes voted.

Negro army enrolment at the end of World War II in 1945 was 8.67%, approximating the population ratio, 695,264 in all, with 475,950 overseas; navy figures increased to 165,397, 60 WAVES and 50 commissioned officers. In addition to creditable war records of the 92nd and 93rd divisions, many Negro detachments in the air corps, transportation, engineer, tank and artillery saw combat zone service in all theatres, with numerous unit and individual citations; 32 units alone received amphibious invasion awards. The 92nd division sustained 5,752 casualties and received a total of 12,096 awards. Negro army re-enlistments reached an 18% level.

In 1945 a Florida court outlawed the restricted white primary, as did another in Macon, Ga. The Los Angeles superior court ruled that restrictive residence covenants were unconstitutional. As the New York state commission against industrial discrimination began functioning, New Jersey, Wisconsin and the city of Chicago passed similar measures. Many industrial companies began anticipating such rules by more liberal employment and upgrading policies. Irving Mollison, of Chicago, was appointed federal customs court judge in New York; Charles W. Anderson became the first Negro state legislator in Kentucky; Ralph Bunche and Norman Manley of Jamaica were named to the Anglo-American Caribbean commission; Benjamin Davis was re-elected to the New York city council; Rev. David W. Harris, Episcopal bishop of Liberia; Horace M. Bond, the first Negro president of Lincoln university, Pennsylvania.

The American College of Surgeons elected Negro physicians. Booker T. Washington was chosen for the National Hall of Fame, and Paul Robeson became the 30th Spingarn medalist. Pres. Branch Rickey, of the Brooklyn baseball team, signed Jackie Robinson to the Montreal squad branch, the first Negro in big-league baseball.

In 1946 throughout the south, elections showed a large increase of Negroes voting. Georgia registrants increased by 118,387 and even in Mississippi, despite threats and acts of violence, 200 Negroes voted. In reaction Alabama

reverted to state conventions instead of primaries and passed by a small margin the Boswell amendment calling for interpretation of constitution as a qualifying test for voters. Senator-elect Theodore G. Bilbo, however, was brought to trial for illicit campaign practices, including threats and intimidation of Negro voters. Renewed Ku Klux Klan activities, a series of mass lynchings, especially in Webster county, La., and at Monroe, Ga., and the organization of a new "white supremacy" order, the Columbians, in Atlanta, indicated serious reactionary trends. However, all situations were widely protested, south as well as north, and FBI investigations were instigated. Gov. Ellis Arnall of Georgia took steps to outlaw both the K.K.K. and the Columbians, and the Klan had its charter revoked in New York state, New Jersey and California.

The U.S. army announced over-all figures for Negro personnel for the war period as 920,000 men and 7,768 officers and promulgated the Gillem report for better integration of Negroes in all service branches. But when Negro re-enlistments reached 20%, the army proposed a ceiling quota of 10%, which was strongly protested. Interracial public protest meetings, particularly a rally of Sept. 23, 1946, at the Lincoln Memorial, Washington, D.C., high-lighted the Monroe lynchings. The Columbia, Tenn., riot trial attracted nation-wide attention, ending in the acquittal by an all-white jury of 23 of the 25 Negroes charged with murder and inciting to riot. The University of Texas was sued for noncompliance with the Gaines decision, and in June 1946 the U.S. supreme court ruled against the racial segregation of passengers in interstate bus travel. There was considerable relaxation of this procedure also on several railroads. Massachusetts passed a fair employment practice measure, and the American Nurses association voted to admit Negro members. The C.I.O. and A.F. of L. both announced wide-scale drives to organize labour without race restrictions in the south. Negro college enrolment at the end of the decade 1937-46 was 53,030, with 5,264 graduates.

In 1946 William H. Hastie was inaugurated governor of the Virgin Islands. Charles W. Anderson became an assistant attorney general of Kentucky, and both William Dawson and Adam C. Powell were re-elected to congress. Ralph J. Bunche was appointed acting-director of the trusteeship division of United Nations, charged with organizing the division. William O'Hara Lanier took up his post as U.S. minister to Liberia, and by a gift of \$250,000 from Harvey Firestone an American Foundation for Tropical Medicine was announced for that country. It was announced that 12 Negro research scientists had served on the atom bomb research staffs. (See also CIVIL LIBERTIES.) (A. LER. L.)

Negro Culture

The period between 1937 and 1946 was marked by a progressive tendency in the U.S. to accept Negro creative artists and interpreters of the arts without restriction based on racial identity. Previously the custom was to departmentalize the Negro American's cultural gifts. The decade saw the old pattern breached at many points and often wholly disregarded. Whether the reason behind this development was a maturing public attitude, a maturing of the artists themselves or a combination of these and other factors was less important than the fact itself, but in all the arts Negroes aimed at achievements not previously attained by members of their group in the United States. Results were generally creditable, sometimes outstanding, and public approval was on the same scale.

Music.—In music, more than in literature and art, perhaps, this trend had been foreshadowed. The achievement of Roland Hayes, a singer less often referred to as a Negro than as a tenor, was already in the record. Paul Robeson and Marian Anderson had attained eminence. Even in music, however, the new tendency was strongly marked.

In 1942 Miss Anderson was given the \$10,000 Edward W. Bok award for outstanding achievement by a Philadelphia. The implications of this honour did not go unnoticed. Here at last was a kind of recognition hitherto beyond the experience of Negro artists in the U.S.—a sort of open evaluation previously reserved for sprinters and prize fighters. Coming after this, the Order of African Redemption, bestowed on Miss Anderson by the Liberian government in 1944, may have been in some respects an anticlimax.

The successful New York debut of Dorothy Maynor at Town hall in 1940 did not follow the pattern set by Hayes and Anderson. These American singers were careful to put European triumphs ahead of their appearances before major U.S. audiences. Miss Maynor first attracted widespread attention when she appeared as soloist at the Berkshire Symphonic Festival picnic in Aug. 1939. Her first New York concert was an outstanding musical occasion in November of the same year, and in 1940 she was awarded the Town Hall Endowment Series medal. Extended tours followed and between these a number of important radio appearances before a national audience.

No other new singer arrived quite so auspiciously during the decade, but several showed brilliant promise, and at least one seemed ready to take her place in the company of the great as 1946 ended. As early as 1941 Charles Holland, tenor, and Virginia Lewis, soprano, were widely noticed. In the same year Louise Burge, contralto, made her bow as soloist with the New York Philharmonic and the Schola Cantorum at the Lewisohn stadium in the summer premier of William Grant Still's choral ballad *And They Lynched Him to a Tree*. Muriel Rahn and Anne Wiggins Brown, both sopranos, left the Broadway casts of *Porgy and Bess* and *Carmen Jones*, respectively, to make successful concert tours, including appearances abroad. Muriel Smith was still a school girl when she was given the lead in *Carmen Jones*, but her singing performance was extremely well received. Portia White, soprano, travelled from her home in Halifax, N.S., to please New York audiences and critics in 1944. Kenneth Spencer brought an unusual bass voice with him from the west coast. Edward Matthews, a featured singer on radio programs for several years, was chosen to sing the baritone lead in the Gertrude Stein-Virgil Thompson opera *Four Saints in Three Acts*. Aubrey Pankey appeared in concerts at Town hall. But the only newcomers whose critical and popular receptions seemed on the scale of those accorded Anderson, Maynor, Hayes and Robeson in their debuts were Carol Brice, contralto, and Ellabelle Davis, soprano.

It was after Miss Brice had sung for the Friends of the Boston Symphony at their annual club concert in the spring of 1946 that Conductor Serge Koussevitsky remarked excitedly that her voice was like a cello.

At least three other singers received serious attention. Each was involved in precedent-breaking—Todd Duncan, tenor, by singing the role of Pagliacci with the New York City Opera company; Camilla Williams by her successful portrayal of Madame Butterfly in a production by the New York City Opera company and Ellabelle Davis by singing leading operatic roles in Mexico. Todd Duncan's

other activities included singing the role of the crippled beggar in *Porgy and Bess*, George Gershwin's folk opera, and concert tours that extended from New York's Town hall to the cities of Australia. Lawrence Whisonant, baritone, and Anne Wiggins Brown, meanwhile, were selected by Leopold Stokowski as two of the four soloists for his presentation of Beethoven's *Ninth Symphony*. Todd Duncan was soloist with the New York Symphony orchestra in its rendition of the same number.

Precedent of another sort was threatened by the budding career of Phillipa Duke Schuyler, child pianist and composer. Except in the field of popular music, no Negro instrumentalist had received major consideration in the U.S. since the strange musical career of Thomas Greene Bethune, better known as Blind Tom, ended in 1905. Making a public performance at the age of 4, Phillipa came along steadily thereafter. In July 1946, at the age of 15, she made her first appearance with the Philharmonic Symphony orchestra of New York at the Lewisohn stadium, playing the second Saint-Saens piano concerto with high approval from critics and public alike.

The same program was significant to the career of Miss Schuyler as a composer. Though she had played original compositions since infancy, this occasion was remarkable in that the Philharmonic Symphony orchestra, under the direction of Thor Johnson, presented the Scherzo from her fairy-tale symphony *Rumpelstiltskin*.

Two Negro conductors came forward during the decade. Dean Dixon substituted for Toscanini when he first directed the National Broadcasting Co. orchestra. Later he became the first Negro as well as one of the youngest men ever to direct the New York Philharmonic. In these and in a number of other engagements he conducted major U.S. symphony orchestras with an understanding and authority that won enthusiastic commendation. Meanwhile, Rudolph Dunbar, a native of British Guiana but trained in the U.S., followed London and Berlin appearances with a debut before the Hollywood Bowl symphony in the summer of 1946.

As a musical creator, too, the Negro made advances in the U.S. If the efforts of Negro interpreters of serious music had been departmentalized in the past, they had seldom been wholly rejected. Negro composers, however, except as writers of popular songs and arrangers of spirituals and scores for musical shows, had won slight recognition. In this decade both program and abstract music by Negro American composers seemed to receive their due.

William Grant Still, already known and respected in a narrow circle, produced 15 major works, including 7 compositions for large orchestra, a ballet and 3 operas, not to mention many vocal and instrumental solos and choral numbers. His more important works were accorded 149 performances by symphony orchestras in the U.S. and in various parts of the world during that time. Many hundreds of program and concert renditions were noted. Typical of the former were the Chicago Symphony's playing of his *Afro-American Symphony*, under the direction of Hans Lange, and the premier of his *Symphony in G Minor* by the Philadelphia orchestra, directed by Leopold Stokowski, both in 1937. In the nine years that followed, *Old California*, *Plain-Chant for America*, *In Memoriam: The Colored Soldiers Who Died for Democracy*, *Poem for Orchestra*, *Festive Overture* and other compositions by Still were played by outstanding musical organizations from Helsinki, Finland, to Sydney, Australia, from Hollywood bowl to Robin Hood Dell, from Duluth, Minn., to Rio de Janeiro, Brazil.

Some of his works were composed on commission from the Columbia Broadcasting system, the New York World's fair, Paul Whiteman, the League of Composers and the Cleveland orchestra. Meanwhile, Still was the recipient of honours which, for sheer volume, would have delighted almost any composer anywhere. Honorary degrees, Guggenheim and Rosenwald fellowships and extensions, awards and trophies became almost routine with him. In 1944 he won the prize offered by the Cincinnati Symphony orchestra for the best overture to celebrate its jubilee season.

The recognition accorded this Negro composer was perhaps typical. Leading artists continued to sing the art songs of Harry T. Burleigh. The violinist Clarence Cameron White had his *Suite of Negro Folk Tunes* played by the Elizabeth (N.J.) Philharmonic society and other works by symphonic orchestras in Columbus, O., and Fort Wayne, Ind. Another of his compositions was played by Jascha Heifetz and included in an album of Heifetz records. The young composer Ulysses Kay won first prize in the 1946 Fellowship of American Composers' contest with *Of New Horizons*, an orchestral work. In the same contest John W. Work's *The Singers* won the prize for a choral composition and was performed by the Michigan State college choir and orchestra at two performances before the 1946 Congress of American Composers. Work's *Yenvalou*, a suite of three movements for string orchestra, based on Haitian themes, was played at the Saratoga Spa festival. His arrangements of folk songs for chorus, a form in which he showed a special interest and facility, began to suggest the beginning of a genre. He published a number of anthems, art songs and piano pieces.

In the creation and performance of popular music Negro Americans continued to play an important part. At least two new developments were seen. The first, perhaps, was the tendency to experiment which sparked the movement toward "swing." The trend was from sweet to hot and then, within limits, back to sweet again. All of which, if it meant little to the layman, was of vital importance in some quarters. The other development noticed was the integration of Negroes into preponderantly white bands. Benny Goodman was the leader in this movement. He soon had many imitators, however, and eventually preponderantly Negro bands were integrating white musicians into their aggregations. A small manifestation of the period was seen in the inclination of some performers to high light the protest elements inherent in blues and sometimes in other folk music. Among these were Josh White and Huddie Leadbetter.

Literature.—Negro writers made important advances in the U.S. Their progress was typified by the career of Richard Wright. In 1937 Wright was employed by the Writers' project in Chicago. By the spring of 1938 his success was assured. *Time* gave him a big send-off: "The U.S. has never had a first-rate Negro novelist. Last week the promise of one appeared. *Uncle Tom's Children*, the first book of a 29-year-old, Mississippi-born Negro, won a \$500 prize from *Story Magazine* as the best creative work done by any of the 1,200 writers on the Federal Writers' Project. Unlike most Negro writers, Wright is neither subjective nor sentimental. . . . It is this central psychological core of Negro life in the deep South, communicated in clear, unemotional prose, which gives Wright's stories their intensity, and a kind of impersonal eloquence."¹

¹Courtesy of *Time*, copyright Time Inc., 1943.

Native Son, a powerful novel, appeared in 1941 and became one of the important books of the year. Distributed by the Book-of-the-Month club, it achieved a circulation of more than 250,000 in its first season. Later the book was dramatized by the author in collaboration with Paul Green, and the play was successfully produced on Broadway and on the road with Canada Lee in the leading role. The book *12 Million Black Voices*, described by the author as a folk history of the Negro in the U.S., followed in 1941. It was a vibrant bit of writing, but it did not catch on with the reading public as his earlier books had. Wright's next published book more than made up the difference, however. *Black Boy* was even more sensational in 1945 than *Native Son* had been four years before. An autobiographical account of the writer's childhood and youth in the south, the book shocked and aroused thousands of readers who had never before imagined what went on in the mind of a sensitive black youngster growing up in a Jim Crow community. Again the Book-of-the-Month club favoured the author.

While Wright's work received more attention than was paid to the writing of any other Negro American during the decade, he was actually just one of nearly a dozen to be favourably noticed. Zora Neal Hurston's best novel, *Their Eyes Were Watching God*, was warmly received in 1937, and Arna Bontemps came back from a Haitian sojourn with *Drums at Dusk* (1939). Chester Himes, another newcomer, got an astonished hearing with *If He Hollers Let Him Go* (1945). In 1946 Ann Petry won a Houghton Mifflin Literary fellowship with *The Street*, the novel that came nearer than any other of the period to duplicating the success of *Native Son*.

Success of a different kind was achieved by Frank Yerby with *The Foxes of Harrow* in that same year. Helped by book club distribution, Yerby's bright, fast-moving novel reached a total circulation of around 1,000,000 copies in its first year. It was also sold to the movies. All of this was unprecedented. Up to that time no Negro American had published a completely successful work of fiction not dealing narrowly with Negro life. Yerby broke out of the department with great vigour and quickly established himself among the nation's foremost writers of colourful historical romance. While this development was without a parallel in American letters, it had many elsewhere: Alexandre Dumas in France, Alexander Pushkin in Russia and Machado de Assis and others in South America. In a peculiar sense Yerby represented the Negro writer's coming of age in the U.S.

A number of literary autobiographies and works of nonfiction prose received serious attention. Langston Hughes's *The Big Sea* was not only a warm and disarming experience to readers in 1940 but a personal history of continuing interest and significance. Two years later Zora Neal Hurston, a contemporary of Hughes's, recounted her literary adventures in *Dust Tracks on a Road*, a book reflecting her vivid personality. Claude McKay called his experiences *A Long Way From Home* (1937), and W. E. B. DuBois selected *Dusk of Dawn: An Essay toward an Autobiography of a Race Concept* (1940) as a title for his reflections on a full life.

The foregoing, like *Black Boy*, were the memoirs of established writers. But the decade in which they appeared produced several new and arresting writers in the same or closely related fields. J. Saunders Redding's *No Day of Triumph* (1942) was a critique of contemporary Negro life in the south, but the book was also noticed for

stylistic qualities, for its autobiographical features and for the freshness of its observation. The state in which the author was living at the time honoured it with the Mayflower award as the outstanding book of the year by a resident of North Carolina, the first time that accolade had gone to the work of a Negro writer. In the following year, too, the outstanding book by a Negro author was a factual commentary on Negro life. New York's Harlem was examined in Roi Ottley's *New World A-Coming*, and the book became a popular success after receiving Houghton Mifflin's \$2,500 Life-in-America prize. Era Bell Thompson's modest and appealing story of her life was called *American Daughter*. Published in 1946, it showed a Negro girl growing up on the western prairies, beyond the Negro community, and it was praised for qualities missed by some readers in the tougher books dealing with Negro life in the U.S. The decade also saw the publication of notable books by white writers inspired by Negro life, among them Rackham Holt's *George Washington Carver* (1943), Lillian Smith's *Strange Fruit* (1943), Edwin R. Embree's *13 Against the Odds* (1944), Howard Fast's *Freedom Road* (1944), Fannie Cook's prize-winning novel *Mrs. Palmer's Honey* (1946) and the play *Deep Are the Roots* by Arnaud d'Usseau and James Gow.

Poetry.—The most significant writing by Negro Americans in the decade that ended in 1936 had been done by poets: James Weldon Johnson, Claude McKay, Jean Toomer, Langston Hughes, Countee Cullen, Sterling A. Brown and others. The decade that followed was dominated by writers of prose. Johnson was killed in an automobile accident in 1938. Little or nothing was heard from McKay and Toomer. Cullen's *The Lost Zoo* appeared in 1940. He died in 1946 after another period of relative silence. Sterling Brown did not publish. Of all this band of singers who, with their associates, brought about the Negro renaissance of the late '20s and the early '30s, only Langston Hughes carried on with full vigour. In addition to books of prose and fugitive writings he added *Shakespeare in Harlem* (1942), a volume of poems, to the shelf of his works and was ready with another, *Fields of Wonder*, as 1946 ended.

Several new voices were welcomed joyously, however. Margaret Walker's debut in 1942 had the blessing of Stephen Vincent Benét and the encouragement of having her first book, *For My People*, included in the Yale Series of Younger Poets. Melvin B. Tolson's rugged poems were collected in *Rendezvous with America* (1944). Gwendolyn Brooks's *A Street in Bronzeville* (1945) revealed qualities not previously noted in the work of Negro poets. Owen Dodson's *Powerful Long Ladder* (1946) may not have been the one that Jacob saw, but it gave good promise. There was promise too from interesting writers who had not yet achieved full-fledged collections of their work. Robert E. Hayden, twice winner (1938 and 1942) of the Avery and Jule Hopwood award at the University of Michigan, showed by contributions to magazines and anthologies that he was definitely on his way. Moses Carl Holman's prize-winning poem in the John Billings Fiske competition at the University of Chicago disclosed an authentic talent, and Myron O'Higgins' first efforts won the respect of critical readers.

An important collection of writings by Negro Americans, selected and edited by Sterling A. Brown, Arthur P. Davis and Ulysses Lee was brought together in *The Negro Caravan* (1941).

Art.—In the middle and late '20s, two groups of Negro artists were clearly identified in the U.S. Of these, the one most noticed had its centre in New York's Harlem, and its

foremost representative was Aaron Douglas, figure painter and illustrator. Associated with the group were Palmer Hayden, Albert Smith, William Johnson, Rex Gorleigh, Augusta Savage and others. The second group was located in Chicago, to which most of its number had been drawn by the Art Institute. At that time Archibald J. Motley was believed by many to be the individual member of the group most likely to achieve major rank among U.S. artists, but his associates were also promising. They included, among others, Hale Woodruff, Sargent Johnson and Richmond Barthé. By 1937 the two groups had fairly well blended. Together they represented the Negro's main strength in art at the beginning of the decade.

Douglas and Woodruff later associated themselves with the art departments of Fisk (Nashville, Tenn.) and Atlanta (Ga.) universities, respectively, but neither neglected his own painting. At the end of another ten years, each was still prominent in his own field. Meanwhile, Barthé, relatively inconspicuous as a member of the Chicago group in the '20s, had at the age of 45 won a place among the best living sculptors in the U.S. His bust of Booker T. Washington, placed in the Hall of Fame in 1946, came at the end of a productive period which saw his small statuary acquired by the Metropolitan Museum of Art and by other leading collections around the world. The same years saw his large groups and heroic figures conspicuously placed in New York and elsewhere.

Meanwhile, much new talent emerged, encouraged first by the Harmon foundation in New York, later by the Federal Arts projects and then by annual shows sponsored by Atlanta university. In 1946 the Albany (N.Y.) Institute of History and Art presented a major exhibit of Negro American art, a show which in its travels drew sharp attention to such newcomers as the 58-year-old Horace Pippin, Jacob Lawrence and Eldzier Cortor. Pippin, whose initial work was done with a hot poker on wood, had his work first exhibited in 1937 at a show arranged by Dr. Christian Brinton of the West Chester Art centre in Pennsylvania. His canvasses were later purchased by the Whitney museum, the Philadelphia museum and many other galleries. Lawrence was precocious. By 1946, when he was 28, his paintings had been bought by 12 museums in the U.S. In 1942 his migration series was featured in *Fortune*. Four years later his work was on the cover of that magazine. At the same time Cortor, two years older, was coming along fast in Chicago where his work won prizes at the Art Institute.

Other newer talents included Charles Alston, William E. Artis, Henry Bannarn, Romare Bearden, Eloise Bishop, Selma Burke, Elizabeth Catlett, William Carter, Charles Davis, Zell Ingram, Joseph Kersey, Charles Sebree, Charles White and John Wilson. (A. Bs.)

Nehru, Jawaharlal

Nehru (1889–), Indian statesman, was born of wealthy parents and was educated at Harrow and Old Trinity college, Cambridge, England. Admitted to the bar in London, he returned to India to participate in the movement for Indian independence. He became a member of the All-India Congress committee in 1918, was arrested repeatedly for political offenses and was associated with the various civil disobedience movements in India after 1921. He was twice president of the Indian Congress party, in 1929 and 1936, and was generally regarded as the most important Indian leader next to Gandhi. More radical than the latter, he urged the need for a socialist, nationalist and anti-British program. His autobiography, written in prison, was widely circulated in Great Britain and in the United States, where it was published under the title *Toward Freedom*. Nehru demanded complete independence for India rather than dominion status. After the Japanese attack on Pearl Harbor, however, he espoused the Allied cause. He was nevertheless arrested and imprisoned in Aug. 1942, along with Gandhi and a large group of Congress party leaders, and was not released until June 1945. In July 1946 Nehru assumed virtual leadership of his party when he was named president of the Congress party. When Britain announced its program for Indian independence, Nehru became leading minister in the interim government. In Oct. 1946 he resigned the party presidency.

Nelson, Donald Marr

Nelson (1888–), U.S. business executive and public official, was born Nov. 17, 1888, at Hannibal, Mo. Graduated from the University of Missouri in 1911, he was employed the following year by Sears Roebuck and company as a chemical engineer. In 1927 he was appointed general

merchandise manager of the company, in 1930 vice president in charge of merchandising, and in 1939 executive vice president and chairman of the executive committee. He served with the National Defense Advisory commission in 1940, and as director of purchases for the Office of Production Management in 1941. In Aug. 1941, President Roosevelt named him executive director of the Supply Priorities and Allocations board. This agency was supplanted in Jan. 1942 by the War Production board, with Nelson as chairman and with authority over the whole U.S. war procurement and production program. By the end of 1943 the production battle was no longer urgent. In late autumn Nelson visited Europe, where he conferred with Stalin and inspected Russian war plants. He was sent to China in Aug. 1944 as President Roosevelt's personal representative to Chiang Kai-shek. Late in September Nelson returned to Washington with Chiang's approval of plans to bring more of China's industrial potential into the war against Japan. After resigning from the WPB, Nelson accepted an appointment from President Roosevelt to act as the latter's "personal representative" to China. Given cabinet rank, he was assigned the task of organizing a counterpart to WPB in China. In May 1945 Nelson resigned as personal presidential representative to foreign governments. The following month he assumed the presidency of the Society of Independent Motion Pictures Producers.

Nepal

An independent state, situated on the northeastern frontier of India, Nepal lies between $80^{\circ} 15'$ and $88^{\circ} 10' E.$, and $26^{\circ} 20'$ and $30^{\circ} 10' N.$ Area: 54,000 sq.mi. Pop.: (est.) 5,500,000. Capital: Kathmandu (108,800). Language: Gurkhali, Newari. Religion: Buddhism, Hinduism.

The hereditary prime ministers and sovereigns of Nepal during the decade 1937-46 were: Maharaja Sir Joodha Shum Shere Jung Bahadur Rana (until Nov. 29, 1945); General Sir Padma Shum Shere Jung Bahadur Rana (after Nov. 29, 1945).

The chief event of the decade was the retirement on Nov. 29, 1945, of the hereditary prime minister and *de facto* ruler, Sir Joodha Shum Shere Jung Bahadur Rana, after 13 years in office. He was succeeded by his nephew, Sir Padma Shum Shere Bahadur Rana, grand commander of the star of India. The former prime minister was the author of many administrative reforms in the military, judicial and educational departments. He did a great deal for improving trade and communications; match factories, and jute, rice and sugar mills were erected, and an important hydroelectric plant was installed. He started the Bank of Nepal in 1937, and banknotes were put into circulation for the first time. He played a leading part in the organization of relief and reconstruction after the disastrous earthquake of 1937.

Nepal played a prominent part in World War II. Though it had a population of only 5,500,000, the number of Gurkha battalions in the Indian army was raised from 20 to 40, and more than 100,000 men were recruited for the Gurkha brigade. In addition, Nepal sent nine battalions on active service, and they won ten Victoria crosses. The viceroy and commander in chief of India both paid visits to the state during 1945; the latter took the salute at the homecoming of the Nepalese contingent. (H. G. RN.)

Nervous Diseases

See MEDICINE; PSYCHIATRY.

Nervous System

Affections of the nervous system received incessant research from the entire medical world during the decade 1937-46. It was during this time that the various sulfonamide drugs and penicillin were developed. Electric convulsant therapy (electric shock) for various mental afflictions was developed into almost a therapeutic miracle in psychiatry, especially for melancholia, confused or toxic psychoses, early obsessional and compulsion states, postpartum psychoses and a small percentage of schizophrenic-like psychoses. Epilepsy received considerable research with newer methods of diagnosis such as electroencephalography and new drugs for its treatment such as dilantin and tridione. Further, such drugs as quinine were found to be an almost specific cure for certain muscular diseases such as myotonia congenita and dystonia. The very disabling and sometimes fatal disease poliomyelitis (infantile paralysis) was the recipient in 1941 of the greatest advances made in the study of a single disease. Although the causative factor of the disease was not discovered, its sources of entry in the human body were found to be, in addition to that by way of air contamination, via the stomach and bowel. If such a concept proved to be correct, prophylactic procedure should prevent infantile paralysis. The National Foundation for Infantile Paralysis in the United States contributed financial support toward such studies.

During the decade considerable work was done in regard to injuries to the peripheral nerves. A new method of examining an injured peripheral nerve and muscle was developed, so that it was possible to determine potential recovery of the involved muscle long before the patient was able to move the paralyzed muscle or muscles. It was obviously a real contribution to the neurologist who very frequently had to give an opinion as to the outcome of a given peripheral nerve injury.

From the many contributions enumerated above, one should be curious to know how they have worked out in their practical application. Certainly the "sulfa" drugs had almost entirely removed abscesses of the nervous system from existence. Mastoiditis and abscesses were, for all intents and purpose, not seen any more. Similarly, victims of the dreaded epidemic spinal meningitis who had a previous death rate of 50% to 60% now enjoyed almost 100% recovery. Penicillin in combination with the "sulfa" drugs cured cases of pneumonic and other forms of meningitis which previously never recovered. Electric convulsant therapy had been, after its introduction by L. Bini and U. Cerletti of Italy, the most potent factor in the management of diseases of the mind mentioned above. This form of therapy was unequivocally proved to be an almost miraculous "drug" in psychiatry. In epilepsy, dilantin proved to be valuable in arresting many major attacks. Its value lies in the fact that it does not produce any drowsiness such as the older drugs did. Occasionally phenobarbital has to be given in conjunction with it. The management of this condition must be in the hands of a physician. Tridione was tried in 1945 and showed some evidence of effectiveness in stopping minor attacks of epilepsy. Electroencephalography (brain wave measurement) was of practical value in some instances of epilepsy. Quinine proved to be an almost certain cure for myotonia congenita. (See also INFANTILE PARALYSIS; PSYCHIATRY.)

(T. T. S.)

Netherlands

An independent kingdom in northwestern Europe, the Netherlands is bounded N. and W. by the North sea, E. by Germany and S. by Belgium. Area (Dec. 31, 1942; excluding the interior waters): 12,867.7 sq.mi., four-tenths of which lay below sea level at high tide; pop.: (1938 census) 8,728,560; (Oct. 1946 est.) 9,479,000. Language: Dutch. Religions (1930 census): Dutch Reformed Church 2,732,300; other Protestants 876,960; Roman Catholics 2,890,000; Jews 111,000; other creeds 180,900; no religion 1,144,400. Chief cities (1938 est.): Amsterdam (793,526); Rotterdam (612,372); The Hague (seat of government, 495,518); Utrecht (163,559). Ruler: Queen Wilhelmina Helena Pauline Maria. Prime ministers during the decade 1937-46: Dr. Hendrick Colijn (May 26, 1933-July 27, 1939); Jonkheer Diek Jan de Geer (Aug. 9, 1939-Sept. 4, 1940); Professor Pieter Sjoerds Gerbrandy (Sept. 4, 1940-June 23, 1945); Professor Willem Schermerhorn (June 23, 1945-May 18, 1946); Dr. Louis Josef Maria Beel (after July 2, 1946).

Rejoicing and Anxiety.—The year 1937 opened with general rejoicings in the Netherlands. Princess Juliana, Queen Wilhelmina's only child and heiress to the throne of the Netherlands, was married on Jan. 7 at The Hague to Prince Bernhard zu Lippe-Biesterfeld. The event came as a welcome break in a period of growing anxiety; for, politically as well as economically, the Netherlands was feeling the effects of world trends and, more particularly, of its eastern neighbour's nationalistic policies and determined attempts at autarky. The general election on May 26 (*see* ELECTIONS), held under the constitutional provision of four-year elections to the lower chamber of the states-general, left Prime Minister Colijn in office but produced a reconstituted cabinet, representing a coalition between Protestants and Catholics in which only the largest parties of the two denominations held seats. Foreign policy, which for more than 15 years after the end of World War I had been simply to support the League of Nations and its principles, was reverting to the traditional neutrality of pre-1914 days under the effects of the League's acquiescence in certain acts of aggression and its consequent loss of prestige. In common with Norway, Sweden, Denmark, Finland, Belgium and Luxembourg, the Netherlands had signed the Oslo convention; this convention was an expression of a common outlook and an economic pact rather than a document establishing political aims and duties. Princess Juliana's first child and heiress-at-law, Princess Beatrix Wilhelmina Armgard, was born on Jan. 31, 1938. Italy's conquest of Ethiopia received a late *de facto* recognition by the Netherlands on Feb. 14; a year later, on Feb. 23, 1939, followed the recognition of Gen-

eral Francisco Franco's new government in Spain.

Because of differences of opinion with his colleagues on the subject of national defense, Dr. J. A. de Wilde, minister of finance in Colijn's cabinet, resigned on May 21, 1939. Further disagreements over the same subject caused the collective resignation of the cabinet on June 29, and the new government which Colijn succeeded in forming on July 25 was overthrown only two days later by a plain vote of nonconfidence in the lower chamber. On Aug. 6, 1939, Princess Juliana gave birth to a second daughter, Irene Emma Elisabeth; and on Aug. 9 Jonkheer D. J. de Geer became prime minister, at the head of a broadened cabinet in which, for the first time in Holland's history, the Social-Democrat party was represented.

Events were moving swiftly toward World War II. Still struggling to avert it, the foreign ministers of the signatories of the Oslo convention assembled in Brussels, and on Aug. 28, 1939, King Leopold issued on their behalf a peace appeal. Precautionary general mobilization was ordered in Holland on the same day. Netherlands neutrality was re-affirmed a day later in a public declaration by Queen Wilhelmina. The king of the Belgians and Queen Wilhelmina, acting together, offered their good offices as mediators to Germany, Poland, Great Britain, France and Italy, also on Aug. 29. Both efforts proved fruitless.

Eight Months of Uneasy Neutrality.—The Netherlands' declared policy of strict neutrality carried with it the duty of forbidding the passage of foreign armed forces over the national territory. Hence the precautionary mobilization of Aug. 28, 1939, and all subsequent defensive dispositions during the anxious eight months before Holland was invaded. No effort on the Netherlands' part could produce an army capable of doing more than delay an invader's forces for a short time, pending the arrival of foreign troops, heavy equipment and, above all, air forces.

It is necessary for the sake of historical accuracy to express the matter in these impartial terms, though there was never any doubt in fact that invasion, if it came, would come from the German side. The first threat of this kind came in the opening week of Nov. 1939, when the Germans assembled heavy troop concentrations along the border. In answer, the Dutch military authorities took all steps necessary for the immediate flooding of the so-called inundation zone. The carefully regulated flooding of areas beyond the Netherlands army's utmost capacities of defense, with ruthless concentration upon the defense of inner areas, had always been Holland's only means—often successful—of standing up against superior attack.

King Leopold of the Belgians visited The Hague on Nov. 10, 1939, and once more he and Queen Wilhelmina addressed telegrams to the rulers of Britain, France and Germany with the object of initiating negotiations. A state of siege, in the meantime, had been declared for the most threatened areas of Holland. A number of false alarms punctuated the winter months, but it was not until April 1940, after the German invasion of Norway, that the threat of attack against the Netherlands became unmistakable and immediate. All military leaves were cancelled on April 9, and a state of siege was extended over the whole national territory on April 13. On May 3 the most prominent men of the Netherlands National Socialist party, numbering 21, all of whom were suspected as would-be helpers of a Nazi invasion, were arrested and interned.

The Five-Days' Campaign.—The invasion came in the early hours of May 10, and in order to create confusion at once at the centre of government, air raids were staged

U.S. soldiers strolling with Dutch children. The youngsters were quartered at Hoensbroek castle, the Netherlands, in charge of nuns

against The Hague at 5 A.M. and again at 10 A.M., while the aerodromes of Schiphol, Bergen, Waalhaven, De Kooy, Soesterberg, Haamstede and Hilversum were systematically bombed; mines were dropped from German aircraft along the Dutch coast in order to stop Dutch vessels from running out and Allied vessels from running in with reinforcements and supplies. In retrospect, it was easy to see that only one thing could have made any worth-while difference in the length of time the Dutch forces could have held up the invasion. If large numbers of men, fully skilled in the use of the most powerful anti-aircraft equipment, together with such equipment in almost unlimited quantities, had been available, the traditional water defense might have presented the Germans with a serious obstacle. As it was, local defense successes could make no difference. It was not, incidentally, until three hours after the air attacks had started that the German ambassador presented any kind of communication from his government. When it came it contained the suggestion that all resistance should cease at once. It was rejected by the Dutch government with a declaration that, by reason of the German attacks, a state of war existed automatically between the Netherlands and Germany.

At the end of the second day, although the Germans had broken through in a number of places, the general position on the eastern front still did not cause anxiety. The approaches to Holland proper, the vital inner defense zone, were still intact. But the northern provinces had been lost, and in the southeast the situation was serious. It was still hoped that Allied forces (French), coming from Belgium, would be able to retake the important Moerdijk bridges and thus stop the Germans from making contact with the air-borne troops dropped around Dordrecht and in the island of IJsselmonde. But the appeal addressed to the Allies for immediate help could not effectively be complied with; they were hard pressed themselves. More and more German air-borne troops and parachutists established themselves within the inner defense zone; Dutch efforts to

dislodge them proved unavailing. On May 13, to establish constitutional conditions in which the war could be continued even if the German invasion forced a military surrender, the Netherlands government decided to transfer itself to England. By that time the Dutch air force had been practically wiped out.

The general situation grew worse during the next 24 hours, and on May 14 General Henri Gerard Winkelman, the Dutch commander in chief of land and sea forces, received an ultimatum that unless resistance ceased Rotterdam and Utrecht would be destroyed by air attack at once, and the same fate would overtake all other Dutch towns within a short time. Before the expiration of the ultimatum Rotterdam was subjected to a murderous air attack which destroyed the whole centre of the town, killed 900 people, destroyed 25,000 dwellings and rendered 78,000 people homeless.

The Dutch supreme command was faced with the alternative of holding out for another day, or two at most, at the cost of the destruction of most of Holland's ancient towns and the loss of many thousands of lives, or capitulation. General Winkelman, carefully exempting the troops in Zeeland and the naval forces as not coming within his command, capitulated on the afternoon of May 14. In order to enable as many ships as possible to take part in the continuation of the war, all vessels at Den Helder had been allocated to the commander of the naval forces during the morning, with orders to proceed to England.

Under the Occupation Regime.—The Dutch never accepted the German contention that, for them, the war was over. Listening in secret to the forbidden broadcasts from London, they acknowledged only the Netherlands government in London, and their acts of resistance and sabotage grew more audacious as time passed. Arthur Seyss-Inquart, an Austrian National Socialist, was appointed reichskom-

missar for the Netherlands on May 29. Under a decree of Oct. 4, 1940, Jews and half-Jewish descendants of mixed marriages were barred from official posts. Leyden university and Delft technical high school were the first seats of higher education to be closed because of their resistance to the dismissal of Jewish professors. Strikes and riots at Amsterdam, Hilversum and Zaandam in Feb. 1941 led first to collective fines upon whole communities, then to even more cruel forms of repression. Compulsory labour service was imposed in May, and in December of the same year the National Socialist party became the only permitted political grouping, all other parties being proscribed. The deportation of Jews to Germany grew to an average of 600 a day by July 1942. Anton Mussert, leader of the Dutch National Socialist movement, was allowed to set up a "state political secretariat" in Feb. 1943. In March, industries were cut down to work useful to the German war effort, and at the same time there began the mass deportations of Dutch workers to the reich which the Germans tried to enforce by means of cancelling defaulters' identity and ration coupons. The result was that scores of thousands of Dutchmen "went underground"; they lived in hiding and used forged papers. A declaration of "loyal submission" was demanded of would-be students of all centres of higher education, resulting in attendances being brought down to practically nil, and finally in closure of the universities.

The Allied counterinvasion of the continent in June 1944 brought the occupation authorities' measures to a new degree of oppression. When Allied troops penetrated into the south of Holland in Sept. 1944, the railways ceased to function by order of the Netherlands government in London so that German defense preparations should be impeded, and Holland entered upon the last seven months of the occupation in conditions of rapidly growing famine. For the greater part of the winter the only ration distribution was soup from communal cook-houses; people burned their garden fences and furniture for fuel, and 25,000 died of hunger before the German surrender.

Within the last months of their occupation the Germans flooded 775 sq.mi. of Dutch territory, much of it without the excuse of military advantage; a particularly bad example was the Wieringermeer Polder. The Allies, to make the German defense of Antwerp impossible, had breached the dykes of Walcheren by air attack, adding another 60 sq.mi. to the flooded area. This meant that Holland's struggle for recovery began with the handicap of more than one-tenth of its total area of cultivation under water. Almost one-half of this was salt or brackish water; several years would pass before the soil could return to normal productivity.

The Government in London.—The royal family arrived in England on May 13, 1940, the members of the cabinet one day later. Princess Juliana stayed only a few weeks, moving on with her two children to Canada, where she remained up to the eve of the return to Holland. The prime minister, Jonkheer D. J. de Geer, resigned on Sept. 4 and was replaced by Professor P. S. Gerbrandy.

As the result of dispositions taken by the government at the moment of invasion, the Netherlands was able to contribute 2,500,000 tons of shipping to the Allied war effort. The smaller vessels took part in Britain's food and fuel distribution which, particularly in the days of the great German air attacks, was dependent on coastal traffic; the larger ships served as transports and freighters in every part of the world. Dutchmen of military age were enlisted in the Princess Irene brigade and in Dutch squadrons of

the various Allies' air forces. Their numbers were not large, but the cumulative effort always remained on the increase.

Dutch forces took part in the counterinvasion. Prince Bernhard served with the invading armies and, on Sept.

*1944. †1946. ‡1943. §1945 value of florin used in conversion.

The Nijmegen bridge across the Waal river in the Netherlands under British guard. Capture of the bridge by British and U.S. troops on Sept. 21, 1944, was a valuable gain in the Allied drive into Germany

3, 1944, became commander of the Netherlands forces under the supreme command of Gen. Dwight D. Eisenhower, which included the command of armed resistance in the Netherlands.

Through *Radio-Oranje*, with two daily broadcasts prepared by Dutch editors and delivered by Dutch speakers, the population of occupied Holland was provided with a trustworthy news service which proved of great value in maintaining morale and stiffening resistance.

When the news of the Japanese attack on Pearl Harbor reached London, the government immediately declared war against Japan, on Dec. 8, 1941; a year later, almost to the day, Queen Wilhelmina made an official declaration of far-reaching importance: as soon as both the homeland and the overseas territories were free again, steps would be taken to reconstruct the Netherlands kingdom on the basis of co-equal partnership between all its components. Princess Juliana's and Prince Bernhard's third daughter, Margriet Francisca, was born in Canada on Jan. 19, 1943; their fourth, Maria Christina, was born Feb. 18, 1947.

The first parts of Holland liberated by the advancing Allies were districts of the provinces of Limburg and Brabant, and as they became free, the wartime cabinet was broadened by replacing a number of its members with men from these liberated regions. Queen Wilhelmina herself arrived in the free part of Holland on May 3, 1945, accompanied by Princess Juliana who had returned from Canada. They were thus both on Dutch soil when the Germans surrendered on the following day.

May 1945–Dec. 1946.—The wartime cabinet, having fulfilled its task, resigned on May 16, 1945. Immediate elections being impossible in the chaotic state of the country and of all official registers, it was replaced by a "stop-gap" government under the prime ministership of Professor W. Schermerhorn, the leader of the *Volksbeweging* (People's movement) of which he had been one of the prime organ-

izers while still in internment under the Germans. Practically all the new ministers were men who had been prominent in various groups of the resistance movement, and the all-important task was reconstruction in every form. Enormous difficulties were encountered in this respect because of the Germans' large-scale destruction of bridges, wharves and quaysides in the ports and their removal into the reich of a great deal of Holland's railway material. To counteract inflationary tendencies resulting from the occupation, the whole of the old note issue was called in during the last week in September to form blocked bank deposits. New notes were issued in strictly rationed quantities, and a great improvement was effected. Holland experienced its most serious postwar shock when the Japanese capitulation, instead of leading to a quick, joyful reunion with the Netherlands Indies, was followed by the realization of grave difficulties to come from that area (see NETHERLANDS COLONIAL EMPIRE).

The first postwar general election was held on May 17, 1946, and revealed the Catholic People's party as the strongest party, with William Schermerhorn's Social Democratic party a close second. A coalition cabinet under the prime ministership of L. J. M. Beel was announced on July 2, the outgoing prime minister becoming chairman, a few weeks later, of the commission-general (three members) appointed by the new government to go to Java for negotiations with the Indonesians.

The enormous material and economic damage wrought by the Germans crystallized Dutch claims for reparations into a demand for territorial compensation by way of frontier rectifications and a number of mining concessions in adjacent German areas. On Nov. 5, 1946, in the form of a memorandum, this was simultaneously presented in Washington, London, Moscow and Paris, involving an area of 775 sq.mi. (See also CURAÇAO; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES; SURINAM [DUTCH GUIANA].) (E. N. v. K.)

Netherlands Colonial Empire

An autonomous part of the kingdom of the Netherlands, the colonial empire under the constitution of 1922 consists of the territory of the Netherlands, the Netherlands East Indies, Surinam and Curaçao. Total area (excluding the Netherlands) c. 789,900 sq.mi.; total pop. (est. 1940) 70,760,000.

The Netherlands East Indies constitute the overwhelming part of the empire: 93% in area and 99.6% in population. They comprise five large islands (Sumatra, Java, the southern part of Borneo, Celebes and the western part of New Guinea), a dozen medium-sized islands and many hundreds of small ones. Total area: 735,267 sq.mi. Pop. (1930 census) 60,727,233; (est. 1940) 70,416,000 of whom 250,000 were Europeans and 1,750,000 Chinese; almost

70% of the total population of the N.E.I. lived in 1940 in densely settled Java and the adjacent small island of Madura. Chief towns: (pop. est. 1940): Batavia (cap., 437,000); Surabaya (or Soerabaja) (313,000); Bandung (or Bandoeng) (167,000). The native population of the N.E.I. is described as Indonesian, with the main exception of New Guinea, where it is Papuan. However, there is no racial uniformity from island to island and even from the coast line to the interior of the major islands. Some 60 languages are spoken, of which Javanese is the most important. The main religion is Mohammedan but there were also (1930 census) 2,120,200 Christians (1,630,900 Protestants and 489,300 Roman Catholics), c. 1,250,000 Brahmans (Bali and the western part of Lombok), c. 1,000,000 Buddhists and an unknown number of pagans. Governor general for N.E.I.: Jonkheer A. W. L. Tjarda van Starkenborgh Stachouwer (June 8, 1936–March 7, 1942); Dr. Hubertus Johannes van Mook (appointed lieut. gov. by the Dutch government in London in 1942, when Jhr. Tjarda was interned by the Japanese).

The Netherlands West Indies is the name given to the two Dutch possessions in the western hemisphere: Surinam and Curaçao. The former, called also Dutch Guiana, is a colony in northeastern South America. Its area is 54,291 sq.mi. and the population was estimated on Dec. 31, 1943, at 167,836, not including some 25,000 bush Negroes and Indians in the interior. About 45% of the total population is East Indian or Javanese, the largest such proportion in the western hemisphere. Chief town: Paramaribo (cap., 54,853). Governors: J. C. Kielstra (Aug. 16, 1933–Jan. 2, 1944); J. C. Brons (after Jan. 3, 1944).

The colony of Curaçao consists of two groups of three islands each off the northern coast of Venezuela. Total area: 403 sq.mi.; pop. (est. Dec. 31, 1943) 119,585. The largest is the island of Curaçao itself (210 sq.mi.; pop. 73,343); it includes the capital of the colony, Willemstad (pop. 33,000). Governors: G. J. J. Wouters (April 7, 1936–May 20, 1942); Dr. Pieter A. Kasteel (after May 21, 1942).

Prelude to War.—Situated at the crossing of the roads between Asia and Australia, between the Pacific and Indian oceans, the N.E.I. were naturally influenced by events in the surrounding countries, and particularly by the ebb and flow of political and economic power on the mainland of Asia. In the decade 1937–46, the position and policy of Japan were therefore of paramount importance for the N.E.I. By its presence alone, as an Asiatic empire with vast military and economic resources and following a determined expansionist policy, it continued to impress the Indonesian nationalist movement in its various branches, as it had done at the beginning of the century, when Japan's victory over the Russian empire stimulated the political awakening of the Asiatic peoples.

From the historian's point of view, the years from 1937 till 1941 can be considered as the prelude to the Pacific war, and the N.E.I.'s part in it. Expenditure for defense (navy and army) rose steadily; in a budget totalling Fl.576,000,000, military expenditure in 1937 amounted to Fl.100,000,000 rising in the following two years to Fl.151,200,000 and Fl.162,000,000, and from 1940 onward (when the mother-country was overrun by Germany and the N.E.I. therefore stood alone) to Fl.169,000,000, reaching a summit of Fl.559,800,000 in 1941 (1 U.S. \$ = 1.8 florin in 1941).

Notwithstanding such heavy financial burdens, the planned economic policy pursued by the government during the first years of the decade showed favourable results. This policy had a two-fold aim: to increase the total national income by developing production—mainly agri-

cultural—and a more even and equitable distribution of this income over all groups of the population, in particular in favour of the rapidly increasing Indonesian population (in Java 23,000,000 in 1895, against more than 48,000,000 in 1940). This economic policy and its results also influenced the relations between the Europeans and the Indonesian population generally in a beneficial way. The old "imperialistic" relations, the contrasts between the "poor toiling Oriental" and the "wealthy European overlord" of the old days were fading, and there came to exist a situation in which both elements of the population felt more like colleagues with parallel instead of contrasting interests.

In these circumstances the political situation, insofar as the masses of the Indonesian population were concerned, remained undisturbed. The intellectual nationalists, however, found too little satisfaction for their ideals and ambitions. After the constitutional reforms of 1922 and 1927, which granted a large measure of autonomy to the N.E.I. in internal affairs, political development regarding imperial relations between the N.E.I. and the kingdom of the Netherlands (in which the parliament at The Hague occupied a pivotal position), made no substantial progress. The attention of the government was more concerned with internal reforms within the N.E.I.; provincial and local councils were established, providing the masses of the people with an opportunity to gain experience of democratic methods and ideas in the local sphere.

Isolation.—The occupation of Holland in May 1940 by the German armies and the subsequent establishment of a Netherlands exile-government in London brought about important changes. The overseas territories of the Netherlands were now cut off from the metropolis of the state; the imperial functions of parliament ceased. For five years a common allegiance to the crown, held by the House of Orange, was the only bond which kept the four parts of the kingdom together. The N.E.I. successfully withstood this shock. Full mobilization of all military and economic resources of the country as a preparation for future events was carried by the support of all classes and races. A native militia was introduced. The fate of Holland stirred sentiments of loyalty hitherto latent among the Indonesian peoples. Answering these sentiments, the queen of the Netherlands on the first anniversary of the German invasion (May 10, 1941) issued a statement from London, that on the liberation discussions would be initiated at The Hague where the overseas territories would be equally represented to discuss the political reorganization of the kingdom.

Meanwhile, after the occupation of Holland, a statement was issued by the Japanese government expressing its solicitude about the maintenance, in the interests of peace and stability in east Asia, of the status quo of the N.E.I. The presumption of Japanese leadership in Asia which this statement implied was soon to be revealed in its true significance when the Japanese began pressing economic claims on the N.E.I. which amounted to an almost complete control of the country's resources (particularly oil). The Japanese government desired to introduce negotiations on this subject in Batavia by delegations under high-ranking Japanese officials accompanied by large numbers of military, naval and economic experts. As Great Britain was too fully occupied with the war elsewhere to provide adequate support against this policy, while the U.S. at that time was still neutral, the Netherlands government did not see its way clear to evade these

Japanese proposals for negotiations and decided to meet the issue squarely. By opposing reason and tenacity to the exorbitant Japanese demands, the Dutch negotiators forestalled the fulfilment of the far-reaching Japanese aims. This episode ended with a joint communiqué on June 17, 1941, which stated that both the Netherlands and the Japanese delegations "greatly regretted that the economic negotiations unfortunately had come to no satisfactory end, but that this would lead to no change in the normal relations between both countries."

From that moment events in the Pacific area moved swiftly. One day after the suspension of monetary and economic intercourse with Japan by the U.S. on July 26, 1941, the N.E.I. took the same measures; in both cases the decision was necessitated by Japanese invasion of southern Indo-China and occupation of the naval bases of Camranh Bay and Saigon. The contacts between the N.E.I. and Japan virtually ceased. By the end of November a Japanese attack in a southward direction seemed imminent; the Dutch fleet was ordered to sea, the N.E.I. army air force kept at battle-stations. When on Dec. 7, 1941, the news came of the Japanese attack on Pearl Harbor, the queen and cabinet in London at 2:30 A.M. cabled instructions to the Netherlands minister in Tokyo to inform the Japanese government, "that, as Japan has opened hostilities against two powers with whom the Netherlands maintain particularly close relations, the Netherlands consider that a state of war exists between them and Japan."

Easy Conquest.—The surrender of Indo-China and Siam offered a decisive advantage to the Japanese who, moreover, possessed an overwhelming superiority in troops, ships and material over the Allies in the South Pacific area. The lack of inter-Allied military co-ordination was remedied as far as possible by improvisation and individual decisions. Squadrons of the N.E.I. army air force were employed in the defense of Malaya and Singapore, and were thereby almost entirely lost. From Dec. 1941 until Feb. 25, 1942, a unified Allied command under Gen. Sir Archibald Wavell functioned in Java. In the actual fighting, great damage and delay to the advancing Japanese amphibious forces was caused by the N.E.I. submarines and what little remained of the air force.

After the fall of Singapore on Feb. 15, 1942, however, defeat became inevitable, but a last determined effort was made by the Allied naval forces under the command of the Dutch Vice-Admiral Karel Doorman to strike at the Japanese armada, which sailed to invade Java (battle of the Java Sea, Feb. 26–27, 1942). This cruiser squadron, which comprised U.S. and British warships as well as the remainder of the Dutch navy, was lost against overwhelming odds, and the heart of the N.E.I., Java, lay now wide open to invasion. The army there, under Lt. Gen. Hein Ter Poorten, had lost its air protection and was forced to surrender on March 7, 1942; the governor-general refused to be evacuated and was taken prisoner. In the end, therefore, the N.E.I. were temporarily lost; by their resistance however, some valuable time was gained for the Allies, and the Japanese invasion of Australia was delayed to such an extent that subsequently it had to be abandoned. (See WORLD WAR II.)

In conformity with the general war aims of Japan, the fundamental policy underlying the Japanese occupation of the N.E.I. aimed at the radical extirpation of all European cultural, administrative and economic elements; a second purpose was the organization of the country and regimen-

tation of the Indonesian peoples to aid the Japanese war effort. The first was done by the mass internment of all Europeans, men and women, in separate concentration camps. Gradually subjected to systematic starvation, they faced annihilation. For the second purpose, all political activities were concentrated in a unified Indonesian party (*Putera*), subsequently extended to embrace all Asiatic inhabitants (Chinese, Arabs, Indians), renamed *Hoekookai*, and placed under the control of a few Indonesians, who were wholehearted supporters of Japan's leadership of east Asia (among these were Ahmed Soekarno and Mohammed Hatta). Through these institutions, to which the Japanese added a para-military youth-movement (*Seinendan*) on totalitarian lines and even the "neighbourhood-associations" (*Tonarigumi*) for purposes of "thought-control," the population was subjected to systematic propaganda of racial hatred against all "white" nations (in particular the U.S. and Britain), in order to prepare them for active participation in the war by their labour, their sacrifices and by raising auxiliary military forces. Countering this propaganda, the queen of the Netherlands, broadcasting from the U.S. on the first anniversary of Pearl Harbor (Dec. 7, 1942), outlined the future policy with regard to the N.E.I., whereby the country would rank as an equal partner with Holland under the crown.

Nationalism Nurtured.—From 1943 onward the course of events showed that in the end a Japanese defeat was inevitable, and the Japanese government changed the trend of its policy in the N.E.I. accordingly; it now opened a perspective that the N.E.I. would eventually be granted a precarious "independence" as a Japanese puppet state, if the people and their leaders were prepared to throw all their weight into the war on the side of Japan. After the Japanese offer of surrender in Aug. 1945, the leaders of the Japanese-sponsored political movement in the N.E.I. headed by Soekarno were summoned by the Japanese commander in chief, southern Pacific, Field Marshal Terauchi, to his headquarters, where consultations took place concerning the setting up of an Indonesian republic, to cover the political retreat of Japan from this area after the military surrender. The Indonesians flew back to Java, and on Aug. 17, 1946, the Indonesian republic was proclaimed at Batavia, with Soekarno and Hatta acting as president and vice-president respectively. Soon afterward they picked another Indonesian, Sutan Sjahrir, who was not tainted as a collaborator, to act as prime minister.

From these events it could be foreseen that the re-establishment of constitutional authority would meet with considerable difficulties. The Netherlands, liberated in May 1945, were prostrate, their military and economic strength negligible. Military authority in the N.E.I. on Aug. 15, 1945, had been transferred from General MacArthur's Southwest Pacific command to Lord Louis Mountbatten's Southeast Asia command; and the British, who had a limited conception of their commitments in the N.E.I. (receiving the surrender of the Japanese armed forces, and the liberating of Allied prisoners of war and civilians interned by the Japanese), had insufficient forces available in this area for the fulfilment of their obligations as an occupying power in the N.E.I. to maintain law and order. When at the end of Sept. 1945 British forces began to land in Java, their commander in chief assumed a neutral attitude between the lawful N.E.I. government and the Japanese-sponsored Indonesian republic.

Insurgence.—Encouraged by these symptoms and emboldened by the wholesale transfer of Japanese armament to their military formations, the insurgent movement

spread rapidly over wide areas, its prestige enhanced by initial success and fortified by terrorism. Detailed proposals for a constitutional settlement of nationalist ambitions, made by the Netherlands government on Nov. 6, 1945, and Feb. 10, 1946, after due consultation in parliament, met with no constructive answer. Under great difficulties, fighting and bloodshed, the majority of Allied prisoners of war and internees were rescued and transferred to protected cities on the coast. Talks between the Dutch lieutenant governor-general and Indonesian leaders were initiated through the intermediary of a British ambassador (Sir Archibald Clark-Kerr, later Lord Inverchapel), but broke down on the Indonesian claim that their republic should be recognized *de jure* as a sovereign state. But soon developments took an even more dangerous course, when communist agitators from the mainland of Asia trickled into the interior and organized the beginning of a social revolution among the Indonesian masses, destitute and starving after three years of Japanese mismanagement and spoliation, and easily incited to violence and pillage. This course of events threatened even the intellectual Indonesian class, and gradually increased their willingness to come to a reasonable compromise with the Dutch.

When Dutch authority returned after the British had left the greater part of the archipelago (except some bridgeheads on the islands of Java and Sumatra), such a compromise was quickly prepared. A conference held at Malino (near Macassar) in July 1946 laid the foundations of a new political and administrative system for the archipelago (except Java and Sumatra); orderly conditions prevailed in Borneo, Celebes and the Moluccas. Sumatra, however, gradually disintegrated into a number of unconnected regions where intertribal fighting went on; in Java the republic outwardly still showed a façade of independent authority, behind which various nationalist, Islamic and communist groups manoeuvred for position. In order to expedite a compromise there also, the queen and parliament of the Netherlands sent in Sept. 1946 three commissioners-general on a mission to Batavia; they had sufficiently wide authority to come to an agreement with constructive elements within the organization of the Indonesian republic in Java. Discussions started on Oct. 7, and a truce was called to stop the irregular fighting between Allied troops and Indonesian bands.

On Nov. 15, 1946, a draft agreement was initialled at Linggadjati (near Cheribon, in west Java), by the Dutch commissioners-general and the leaders of the Indonesian republic of Java and Sumatra. According to this agreement the republic would take its place in a federation with the other islands of the archipelago. This *fédération* would bear the name of United States of Indonesia, and in its turn would enter into a union with the kingdom of the Netherlands, headed by the queen. As this agreement, which was to come into force on Jan. 1, 1949, virtually meant the end of Dutch parliamentary control over the affairs of the union and of Indonesia, opposition to it in Holland was strong. Nevertheless the Dutch cabinet gained for it the support of a substantial majority in parliament (65 votes to 30, on Dec. 20), and the commissioners-general returned to the Indies with authority to sign the agreement on behalf of the Dutch government. It remained to be seen whether the Indonesian leaders had sufficient authority to sign, and if so, to implement the Linggadjati agreement. (W. G. P.)

Klein, *Nieuw Guinee*, 3 vol. (1935–38); J. S. Furnivall, *Netherlands India: A Study of Plural Economy* (1939); A. van den Bosch, *The Dutch East Indies* (1941); W. H. van Helsdingen and H. Hoogenberk, *Daar Werd Wat Groot Verricht: Nederlandsch-Indië in de XXe Eeuw* (1941).

Economic Consequences of the Japanese Occupation.—

During the Japanese occupation, agricultural production rapidly diminished. In 1943 the Japanese requisitioned at very low prices 25% of the harvest and in 1944 as much as 50%. Native farmers therefore were not willing to plant more food than they needed. Moreover, the Japanese forces needed large quantities of leather; they requisitioned and killed a great deal of cattle. The native farmer in Java lost the best specimens of his stock, which he needed badly for tilling the soil. Almost 4,000,000 of the farmers were forced to serve as *romushas* (slave labour) in the Japanese-occupied lands, and it was estimated that only 10% to 15% of these returned to their villages. For these reasons the Japanese occupation had disastrous results on the production of food crops in Java; rice production declined by 20%, maize by 40%.

It appeared from Japanese reports that in the residency of Batavia (6% of the total population of Java and Madura and a rice-producing area) the birth rate decreased from 2.8% to 1.5% in the period from 1942 to May 1945. In the same period the death rate increased from 1.6% to 2.8%. The yearly increase of the population of 1.2% had changed to a yearly decrease of 1.3%. The death rate of Kedu residency rose to 10%, in Soerakarta residency to as much as 11.5%. It was estimated that during the Japanese occupation 2,450,000 people died in Java from starvation and want, apart from the *romushas* who perished far from their native villages.

The Japanese furthermore wrought terrible havoc in western agricultural enterprises. About 7% of the acreage of rubber was destroyed in Java and 14% in Sumatra. More than 22% of the tea plantations in Java and 33% in Sumatra were cut. Twenty tea factories were converted into four machinery factories, two textile factories, seven factories of chemical and pharmaceutical products and explosives, one paper factory, one factory of household articles, etc. About 22% of the area under coffee and 16% of all the oil palms were destroyed, while tobacco fields were used for growing food crops. Out of 112 sugar factories in running condition, 39 were demolished and 42 were converted into: 13 factories of chemical and pharmaceutical products, 18 factories of earthenware, 8 machinery factories, 2 textile factories and 1 paper factory. The Japanese had planned the production of 200,000 tons of butanol, using sugar as raw material. This butanol was to be shipped to Japan and to be used for the production of aviation spirit. The plan completely failed because there were not sufficient tankers available.

After the reoccupation in 1946 of Celebes, Borneo, the lesser Sunda islands, Banka and Billiton and the Moluccas by Allied troops, a Netherlands Indies Rubber Fund (*Nirub*) was established in order to provide native rubber-growers with implements for tapping rubber trees and chemicals to coagulate latex. Native rubber was bought, transported, remilled, smoked, packed and sold by the *Nirub*. As soon as private businessmen were capable of taking over a job, the *Nirub* retired. All owners of rubber estates had to join the Union of Rubber growers, a section of the *Nirub* organization which provided them with implements, machinery, trucks, labour, food, etc. *Nirub* also imported inducement goods, *viz.*, rice, textile, implements, household articles etc., since native rubber growers wanted

commodities, not money. In the same way, exports of copra after the war were stimulated by the Copra fund. Coconut groves of western Borneo had been seriously neglected, and it was estimated in 1946 that it would take about two years before they were in full production again.

Smoking oil tanks and cars, fired by the Dutch as they evacuated petroleum centres in Java during the Japanese invasion of March 1942. This Japanese photograph reached the United States through Brazil

The industrialization in the N.E.I. was stimulated by the economic depression of the 1930s. In this period the trade balance soon became unfavourable for the archipelago, because prices of export products declined much more rapidly than prices of imported commodities. Native handicraft and Dutch and Chinese factories tried to produce these commodities at much cheaper prices, using native labour, paid on the Pacific wage level. The Dutch government supported these efforts by creating funds granting credits to small industries, promoting vocational education, and protecting the young industries by import duties and quotas.

Netherlands Indies (Indonesia)

The Netherlands Indies stretch 3,000 mi. from east to west and 1,300 mi. from north to south, between 6° N. and 11° S. latitude, and from 95° to 141° E. longitude. Largest island archipelago under unified rule, it includes the large islands of Sumatra, Java, Celebes, Borneo, whose north-eastern part is under British rule, and a multitude of smaller islands, together with the western half of New Guinea. The total population was estimated in 1940 at about 70,476,000, all but 2.6% of them being indigenous; 45,000,000 lived in the islands of Java and Madura, where the density of population ran as high as 1,000 inhabitants per square mile. The others were spread thinly over the vast spaces of the other islands, except on the small island of Bali, well known for the picturesqueness of its land, which was almost as densely populated as Java.

Malay is to a certain extent a language of intercommunication between different population groups speaking 25 main languages and 250 dialects. Dutch is spoken by the increasing numbers of those with a western education. Of the native population 90%, collectively called Indonesians, are of Moslem religion. The European population, about 250,000, is mostly Dutch, including some 140,000 Eurasians. Chinese constitute about 2% of the total population; 60% having been born in the Indies no longer speak Chinese, but speak Malay.

The government of the Indies, originating from a complex of small settlements and protectorates, became integrated into a single though decentralized rule for the entire territory. Before World War II a single parliament, the Volksraad, with limited powers, consisted in part of elected and in part of appointed members. The law administered by central courts was similar to that of most advanced countries, but in local affairs fullest recognition was given to the indigenous customary law.

Constitutional and administrative changes carried out a long-term policy of democratization. The powers of the Volksraad were strengthened and its composition was made more representative. In the last local elections before the war, more than 6,000,000 Javanese cast their votes. In the provinces outside Java, participation in government was much less advanced; but there, too, many local councils were elected by popular vote.

While the majority of the inhabitants still followed a simple, almost self-sufficient peasant life, part of their revenue as well as a good deal of the revenue of the territory

Revolutionary slogan lettered across a car in Surabaya, Java, shortly before the outbreak of insurrection in Oct. 1945

as a whole was derived largely from export of raw materials mainly of agricultural origin. As industry was only in its infancy, the proceeds of this export served to pay for a long list of import-needs. During the booming years of the 1920s nothing in this situation had seemed unwholesome. A substantial percentage of the world's export of a long list of raw materials came from the Indies. However, the economic depression at the beginning of the 1930s had brought to full realization the Indies' precarious dependence on world markets for their principal products. The index figures for wholesale prices of goods exported between 1929 and 1936 declined from 100 to 32, that of goods imported only to 47.

To remedy the ill-effects of this situation, a new economic policy was set up, based largely on making the Indies self-sufficient in its need of rice, the main food, and on industrialization in order to make the country less-dependent on import needs. Participation in international production regulations like those set up for rubber, tin, sugar, helped to offset in a way the ill-effects of over-production. Furthermore, it proved necessary to control the imports in order to reserve the profitable import trade principally for those countries which were customers of the Indies' export products.

Recovery, however, was difficult and slow. At last, in the beginning of the decade 1937-46, it seemed that the worst was over. The new economic policy started to bear fruit.

Japan's Economic Aggression.—The Japanese demands of 1934 to attain preferential treatment in the Indies had been rejected. A strong Japanese trade delegation had come to Batavia for this purpose, but the Netherlands Indies government stuck to its contention that the benefit of the country's resources and trade should go first to its citizens and second to its regular customers, among whom the U.S. and Great Britain were foremost. Between 1929 and 1935, Japan's share in the Indies' imports had grown from 11% to 30%, whereas Japan did not take more than 5% of the island's exports.

A second Japanese attempt to dominate the country economically came in 1940, when the Netherlands were overrun by the Germans. Another large trade delegation to Batavia expected to find a society disconsolately cut off from its home country and desirous to find a new sponsor and protector. It found a self-conscious and prosperous country, never before so united, and determined to reject Japanese demands of preferential treatment, the more so since such preferential treatment at that time would have meant strengthening of the axis, with which Japan was already siding. The attitude of the U.S. not to tolerate changes in the status quo backed the Indies stand. Huge supplies of rubber, tin, quinine and vegetable oils went to the Allies. Japan did not get more than was needed for its domestic use in order to prevent surplus supplies from being sent to Germany via the trans-Siberian railway.

Preparation for War.—By the end of 1940 there was no longer any question as to the Japanese empire's intentions. Through its forced allies, Thailand (Siam) and Indo-

China, Japan was securing large supplies of food and war materials. It created naval bases that could be used only for a premeditated attack on the rest of southeast Asia. Another Japanese trade mission to Batavia returned in June 1941, defeated by the determination of the Indies government to do nothing that would strengthen the axis, even though this meant imminent danger to its own security. War was in the air.

All but 2,000 of the Japanese "merchants" who had flocked to the islands went home.

The Netherlands Indies government before and after the outbreak of war in Europe had done everything possible to strengthen its military, naval and air forces. Military draft existed for the citizens of Netherlands origin; in 1940, military draft was also introduced for all the other citizens.

However, armament was hard to get even for countries like the Indies which could pay with gold.

Quick Conquest.—Within a few hours of the attack on Pearl Harbor and Singapore, the Netherlands government in London declared war on Japan, even before formal declarations of war were issued by the U.S. and Great Britain. Netherlands submarines were out far to the north of the Indies in the South China sea and in the Gulf of Siam, and they accounted for many Japanese transports. General Sir Archibald Wavell had established headquarters in Java and had assumed over-all command of Allied military, naval and air forces in southeast Asia.

However, a series of adversities turned the campaign in southeast Asia into a calamity for the Allies and into a continuous victory for the Japanese. With the U.S. fleet crippled at Pearl Harbor, the U.S. air forces in the Philippines practically destroyed and two British battle cruisers destroyed off Singapore, the Allied ground forces, fighting with insufficient or without air cover, had to cope at every meeting point with stronger Japanese units concentrated at will, thanks to sea and air supremacy. So Manila and Singapore fell, and the Japanese then concentrated on the Indies. At that time the Dutch air forces had already sustained heavy damage in the defense of Singapore, where the British had called them in for assistance.

The Japanese penetrated into the Indies in a many-pronged amphibious attack, taking Tarakan and Balikpapan on the island of Borneo and, after the surrender of Singapore, also Palembang on the island of Sumatra, all of them important oil ports. The oil installations, however, were systematically destroyed by the Dutch. The combined sea strength of the Allies in the area was placed under the command of the Netherlands Rear-Admiral K. W. F. Doorman. This combined squadron inflicted heavy losses on the Japanese fleet in the battle of the Java sea—a series of shifts between open fighting and strategic retreat. Admiral Doorman made a last, desperate foray against the invasion fleet off Java's north coast. Inflicting heavy damages upon the Japanese, the Allied fleet succumbed, leaving Java open to a landing, which subsequently was made with overwhelming forces on three places along Java's long northern shore.

On March 8, 1942, Java surrendered. However, a scorched-earth policy here and elsewhere in the Indies prevented the Japanese from reaping instant military benefits for further conquests.

Road Back.—The governor-general of the Indies, A. W. L. Tjarda van Starkenborgh Stachouwer, stayed with the men he commanded and was interned with them. But before the surrender of Java he had sent Lieutenant Gov-

ernor-General Hubertus J. van Mook out of the Indies to organize the campaign to reconquer the territory. Van Mook set up headquarters in Australia; the only part of the Indies escaping occupation by the Japanese was the southern part of Netherlands New Guinea, with Merauke as its centre, near Australia.

The way back to Java proved to be long and difficult. On April 29, 1944, fully two years after the surrender of Java, General MacArthur's forces, seconded by Netherlands Indies military and civil units, secured their first foothold on Japanese occupied Netherlands Indies soil, at Hollandia on Netherlands New Guinea's north shore. After the liberation of the Philippines, Tarakan was retaken from the Japanese. After the surrender of the Japanese empire on Aug. 15, 1945, the Netherlands in Europe could not participate in a substantial way in the liberation of the Indies. They had been liberated themselves only since May 1945, and they were in a condition of extreme starvation. The liberation of the Indies was originally MacArthur's task, and he had plans and forces ready. But at the last moment it was shifted to Britain's Mountbatten, who did not have forces at hand. It was not until Oct. 1945, fully two months after the Japanese surrender, that the British moved in with a single division, an inadequate force to meet a situation which had grown entirely out of hand. To understand the political and military sides of this situation it is necessary to look back first at the political situation before and during the Japanese occupation of the Indies.

Dutch Political Reforms.—In the 1930s, a nationalist movement, born in 1910, after having strived for immediate independence, gradually channelled itself into co-

Sutomo, Indonesian extremist leader in eastern Java, emphasizing a point during an address at his headquarters in Mojokerto, Java

operation with the Dutch on the basis of a commonwealth with equality between Dutch and Indonesians. This conciliation was brought out unmistakably by an all-out investigation of the wishes of the different groups and parties in the Indies, set up to prepare political reforms, and finished just before the Japanese invasion. The report of this commission was named for its chairman, Visman.

During World War II, the Netherlands government in London understood that Netherlands Indies rule could return to the islands only on the basis of a newly declared policy. Queen Wilhelmina made a declaration of this policy on the first anniversary of the Pearl Harbor attack, in Dec. 1942. Her declaration recognized that a lasting co-operation between the Indies and the Netherlands should be established on a voluntary basis; to this end it offered an equal partnership in a commonwealth, with full autonomy for each constituting part in its noncommunal affairs. However, the declaration did not reach the Indonesians on account of the Japanese news blackout; other circumstances prevented the declaration from fructifying.

Political Results of the Japanese Occupation.—It was only natural that Japanese victory over Allied forces in southeast Asia should make a deep impression on the native population, an impression which became more deeply imbedded when Japanese occupation was accompanied by internment, ill-treatment and humiliation of the white peoples, men, women and children. Japanese propaganda not only geared the conquered countries to the Japanese war-effort; it also aimed at alienating the native peoples from their former metropolitan countries. A rigid regimentation covering all aspects of social, economic and cultural native life served both purposes. Whereas all existing political associations were disbanded, adhesion to a Japanese-led Asiatic co-prosperity sphere was promoted. Realization of this plan would have meant making friends of the Indonesian peoples. But already Japan's need for the strategic raw materials and the manpower of the Indies was so great that every political object had to be subordinated to the object of maximum production, and this could be achieved only under compulsion. Toward the end of the occupation, looting as well as inefficiency resulted in a serious lessening of production capacity. Millions of people were close to starvation.

The lack of purchasable goods produced serious inflation. By lowering wage rates and introducing compulsory saving, the Japanese hoped to arrest inflation and secure a cheap labour supply without seeming to enslave the people. Thousands upon thousands of Javanese were deported as construction gangs, the starved and depleted remnants of which were found by victorious Allied armies in New Guinea and elsewhere. As a result, there was little love for the Japanese. These conditions made a breeding ground for revolt, as the Japanese themselves had experienced to some extent during the occupation, and as the returning Allies were to experience later on a grand scale.

The Japanese continued their anti-white and anti-Netherlands propaganda uninterrupted for three years. They brought native leaders to the fore instead of the former traditional chiefs. Thousands upon thousands of young men were regimented and indoctrinated in civilian organizations and later in military organizations. In a country where everything from food to clothes was getting scarce, these men were well provided for if, with the material aid, they swallowed the political food of Japanese origin.

After the Japanese had suffered their first reverses in the Pacific war, they started to dangle independence before the eyes of the Indonesians. A few days before their

surrender the Japanese precipitated the establishment of the republic of Indonesia. This became a fact on Aug. 17, 1945, two days after the Japanese surrender. Soekarno, a graduate of an engineering college in the Indies, later a nationalist leader and orator, who often clashed with the Dutch, became its self-styled president and Mohammed Hatta its self-styled vice-president.

Republic of Indonesia.—The republic of Indonesia came into being in a vacuum of authority. The British could not be on the spot in time and in force; the Japanese, dispirited and disposed to make things difficult for the returning western powers, surrendered arms to the Indonesians. The Dutch government and Dutch forces returning from headquarters in Australia were hampered by a communist Australian waterfront strike against Dutch ships.

From the outset the republic of Indonesia enjoyed also the support of Indonesians who had not collaborated with the Japanese. The republic was nonetheless plagued with factional strife and terrorist gangs. Central authority, if present at all, was weak in the beginning. However, the Allied (British and Netherlands) occupational forces were also weak. Victims of this situation were the former prisoners of war and internees, men and women and children, whose camps were continually attacked by bands of terrorists.

Gradually, after a time, and at the expense of much fighting, safety zones were established in and around the large cities in Java. In Nov. 1946, more than a year after the Japanese surrender, the last of the men, women and children interned by the Japanese were brought to these zones, but even then thousands of Eurasians, put into camps by the nationalists, were still in their hands.

The Dutch and the Indonesians.—The Dutch were successful in re-establishing their authority in Borneo and in all the islands east of Borneo and Java.

When fresh troops arrived from the Netherlands they took over the military job of the British in the four cities of Java and in a few places in Sumatra. On Nov. 30, 1946, military command in the Indies was transferred from the British to the Dutch.

The republic Indonesia more or less consolidated itself. Negotiations between the Dutch and the Indonesians had been carried on for some time in order to establish a basis of political understanding. To the fore came Van Mook on the Dutch side, Soetan Sjahrir as prime minister on the republican side, and Lord Inverchapel, British ambassador, as representative of the military power endowed with military command on behalf of the Allies. The home government in the Netherlands, in order to stimulate these negotiations, dispatched a commission general of three men: W. Schermerhorn, former prime minister of the Netherlands, M. J. M. van Poll, a member of the Netherlands states-general, and F. de Boer, a former shipping director and mayor of Amsterdam. By this time Lord Inverchapel was replaced by Lord Killearn. The mission resulted in a truce between Netherlands and Indonesian forces, followed on Nov. 15, 1946, by a political agreement, signed at Linggadjati, a mountain resort near Cheribon, Java.

The agreement included a *de facto* recognition of the republic of Indonesia as a sovereign state as far as the islands of Java and Sumatra were concerned. The republic, together with the states to be formed in an equal position in Borneo, and in the islands east of Borneo and Java, were to be a commonwealth under the name of the United States of Indonesia. This commonwealth was to

Young Indonesians, armed with sharpened bamboo poles, on parade at a nationalist rally in Java late in 1945

enter into a union with the Netherlands (and the Netherlands West Indies) under the Netherlands crown. In Dec. 1946 the Netherlands parliament, after stiff opposition of a minority, approved the outline of these reforms.

Neurath, Constantin von

Count von Neurath (1873–), German statesman, was born on Feb. 2, 1873, in Wuerttemberg and was educated at the law faculties of Tuebingen and Berlin universities. After serving in diplomatic posts in London from 1903 to 1907 and in Istanbul from 1914 to 1916, he was minister to Denmark in 1919, ambassador to Italy in 1921, and ambassador to Great Britain from 1930 to 1932. Appointed foreign minister of the reich in 1932, Neurath retained this post under Franz von Papen, Kurt von Schleicher and Hitler. In Feb. 1938 he was ousted by Hitler in favour of his nazi associate, Joachim von Ribbentrop. Neurath was appointed Reichsprotector for Bohemia-Moravia in March 1939, but as he was considered too lenient in his treatment of the Czechs, he was formally

declared "on leave of absence" in Sept. 1941, and the actual administration of the protectorate was transferred to Reinhard Heydrich. Captured by French troops after the defeat of Germany in World War II, Neurath was indicted as a major war criminal. In Oct. 1946 he was sentenced by the Nuernberg tribunal to 15 years' imprisonment.

Nevada

One of the mountain group in western United States, Nevada, popularly called the "Sagebrush" or "Silver" state, entered the union as the 36th state on Oct. 31, 1864. Area 110,540 sq.mi. with 738 sq.mi. of water. Population (1940) 110,247, of which 66,956 were rural and 43,291 were urban; 93,431 were native white and 10,599 were foreign-born white; 664 were Negro and 5,553 were of other races. Capital, Carson City (2,478); other cities: Reno (21,317); Las Vegas (8,422); Sparks (5,318); Ely (4,140); Elko (4,094). On July 1, 1944, the bureau of census estimated the population at 156,445.

The principal state officials in 1937 were: governor, Richard Kirman; lieutenant governor, Fred Alward; secretary of state, Malcolm McEachin; attorney general, Gray Mashburn.

In 1938 E. P. Carville was elected governor, and Maurice J. Sullivan lieutenant governor. Other principal state officers elected were: secretary of state, Malcolm McEachin; attorney general, Gray Mashburn; treasurer, Dan Franks; controller, Henry Schmidt; surveyor general, E. W. McLeod; mine inspector, Matt Murphy.

In 1939, Nevada held its Diamond Jubilee celebration at Carson City on Oct. 29, 30 and 31, marking its 75th year of statehood. Legislation passed in this and the immediately preceding years included a workmen's compensation law, child labour laws, a women's minimum wage law and a law to permit open gambling under state licence. Nevada had made no material changes in its tax laws, except the gasoline tax, in 30 years.

The Democratic vote for Franklin D. Roosevelt in the 1940 presidential election was 31,945, the total vote for Wendell L. Willkie, Republican nominee, was 21,229. Outstanding events of the year 1940 were the election on Nov. 5, closely followed by the death of Key Pittman, for 26 years U.S. senator for Nevada. Pittman, again elected for a six-year term, died in Reno on Nov. 10, after a brief illness.

The electorate in 1940 approved an amendment to the state constitution whereby all licence fees and gasoline tax fees paid by motor vehicles were to be expended for public highway work in Nevada.

A second amendment denied the state legislature the power to abolish any county in the state unless the voters of the county affected should first approve such abolishment.

In 1941, the appointment by Governor Carville of a director of the state council of defense resulted in Nevada's having an efficient operating council months in advance of U.S. entry into the war. The council was financed by an emergency appropriation of \$10,000 passed

by the legislature.

Nevada in 1942 geared itself to war. The naval project at Hawthorne, the Reno air base at Lemmon Valley and the \$100,000,000 magnesium plant at Las Vegas caused great activity and increase in population. A curtailment in precious metal mining caused a serious setback in many sections. The Democratic party made a clean sweep in the general election of Nov. 3, re-electing E. P. Carville governor; other officials elected were: lieutenant governor, Vail Pittman; secretary of state, Malcolm McEachin; attorney general, Alan H. Bible; treasurer, Dan W. Franks; controller, Henry C. Schmidt; superintendent of public instruction, Mildred Bray; U.S. senators, Pat McCarran and J. G. Scrugham; representative in congress, Maurice J. Sullivan; chief justice, William E. Orr.

The 41st session of the legislature in 1943 was featured by legislation retiring all outstanding bonds and the creation of \$1,000,000 postwar fund. Other acts passed by the legislature included the following: the Flight Strip act, authorizing the department of highways to co-operate with the Public Roads administration of the U.S. in the construction and maintenance of flight strips and of certain classes of highways; the Nevada State Police act, which provided for the creation and organization of a state police consisting of 1 inspector, 3 sergeants, 5 subordinate police officers and 250 reserves.

The creation of a postwar fund by the legislature placed the state in a favourable position to aid the returning service men, and Nevada's postwar program and formation of working economic conferences set a pattern which other states copied. The postwar fund reached the total of \$1,510,138 in cash and bond balances; this fund was in addition to the cash balance of \$3,820,197 in the general fund, which also would aid in financing the postwar program, giving service men and women employment on their return to civilian life.

In the presidential election of 1944, Franklin D. Roosevelt received 29,623 votes and Thomas E. Dewey 24,611.

The 1945 session of the state legislature passed many important laws; outstanding was the legislation imposing a gross business tax of 1% on gambling. This levy created widespread interest throughout Nevada and resulted in collections, during the period July 1, 1945, to Dec. 31, 1945, of \$98,066. Many bills were approved increasing the salaries of elective, appointive and general employees of the state; salary increases averaged 15%. Legislation completely reorganizing the governing board of the state hospital for mental diseases was passed and resulted in improved conditions at the hospital.

During 1945, important changes occurred in the political setup in the state. First in order of importance was the death of U.S. Senator James G. Scrugham, on June 23; this was followed by the resignation of Governor E. P. Carville on July 24, Lieutenant Governor Vail Pittman being elevated to the position of governor. Pittman later appointed E. P. Carville as junior U.S. senator. Other appointments were: Gilbert C. Ross to succeed Albert L. McGinty, who resigned as director of the state employment security department; Charles Lee Horsey as supreme court justice to succeed William E. Orr, who was named to the U.S. circuit court of appeals; Roger Foley to succeed federal judge Frank H. Norcross, who retired. In Jan. 1946, state officers were: governor, Vail Pittman; lieutenant governor, vacant; secretary of state, Malcolm McEachin; controller, Henry C. Schmidt; superintendent of

public instruction, Mildred Bray; chief justice of the supreme court, E. J. L. Taber.

The 1946 general election was marked by a political upheaval in Nevada despite an almost two to one Democratic registration. The voters elected Republican George W. Malone to the United States senate and Charles H. Russell as representative in congress. Vail Pittman, Democrat, however, who had been acting governor from July 24, 1945, was elected governor by a large majority, carrying with him the entire Democratic state slate of officials, as follows:

Lieutenant governor, Clifford Jones; secretary of state, John Koontz; state controller, J. P. Donovan; state treasurer, Dan W. Franks; superintendent of public instruction, Mildred Bray; attorney general, Alan H. Bible; chief justice of the supreme court, Edgar Eather; justices, Charles Lee Horsey and E. J. L. Taber.

Lead	1,103	398	1,063	708	1,057	1,127

Further changes occurred in the state's political set-up during 1946: Supreme Court Justice Edward A. Ducker died on Aug. 15; Judge Edgar Eather was appointed by Governor Vail Pittman on Sept. 6, to fill the vacancy; thus, for the first time all three members of the state supreme court faced the voters in the general election.

New Brunswick

One of the original four provinces of Canadian confederation in 1867, New Brunswick is a compact geographical unit of 27,985 sq.mi., of which only 512 sq.mi. are fresh-water lakes. Almost three-quarters surrounded by arms of the Atlantic ocean, the province is bounded on the north by Quebec and the Bay of Chaleur; on the east by the Gulf of St. Lawrence, the Strait of Northumberland and the narrow Chignecto isthmus through which runs the western extremity of Nova Scotia; on the south by the Bays of Fundy and Passamaquoddy and on the west by the state of Maine and the province of Quebec.

Though between 1911 and 1921 the cities grew faster than the country areas, the 68% rural composition remained steady from 1931 on. The figures were: (1931) 408,255; (1941) 457,401; (1946 estimate of the dominion bureau of statistics) 468,000. Although Fredericton (10,062) is the capital, Saint John (51,741) and Moncton (22,763) are larger centres.

In 1941, about two-thirds of the population were of British stock, one-third of French and one-tenth Dutch. A few other even smaller racial groups were recognized. Largest religious denomination was Roman Catholic, numbering almost half the population; the Baptist Church was next and close behind, the United Church of Canada and the Church of England.

There were about half a score other smaller religious denominations.

Lieutenant-governors during the 1937-46 decade were Col. Murray MacLaren (Feb. 8, 1935-March 12, 1940) and William G. Clarke (after March 12, 1940). Premiers were A. Allison Dysart (July 16, 1935-March 13, 1940) and J. B. McNair (after March 13, 1940).

* * *

"STABILITY and modest expansion" best described New Brunswick's political and economic history during the 1937-46 decade. Under Conservative policies from 1925-35, the electorate shifted to Liberal policies in 1935 and continued to support the Liberals by a wide margin in the 1939 and 1944 elections.

Both the Dysart and McNair regimes strove for a balanced economy; and, eager to capitalize on postwar opportunities, the McNair government in 1944 created three organizations to offer recommendations. The Committee on Reconstruction proposed a long-term development of existing primary industries and creation of secondary industries. The Natural Resources Development board investigated particularly the forest resources. A new department of industry and reconstruction took up the recommendations of the board and urged manufacturers to add new lines to those already being produced, including exploitation of vast peat bogs and high-quality marble deposits.

As suggested, most of New Brunswick's manufacturies

were still confined to processing raw materials from farm, forest and sea. Thus, by its very nature, New Brunswick's industry did not enjoy the World War II prosperity of more highly industrialized Ontario. And, conversely, when the war ended it did not have sharp reconversion problems.

Nevertheless, within the capacities of the province's industrial structure, it made a notable war contribution and benefited thereby.

There was a modest growth in capital plant and employee pay rolls in the province, and the value of manufactured goods expanded from \$69,500,000 in 1937 to \$141,000,000 in 1943.

With forested areas its largest single resource, New Brunswick's 1937-46 industrial stability came from that raw material.

Thus, it was natural that the government's postwar economic program was so largely in terms of forestry management and conservation. With the close of the war, the lands and mines department built more forest roads, erected more lookout towers, installed more telephone and radio communication and improved rivers for log drive purposes.

In 1946 it opened a ranger school at the University of New Brunswick.

Stimulated by the war, agriculture, next largest primary economic division after forestry, reached unprecedented production levels toward the end of the 1937-46 decade. Farm capital investment increased by more than 10% while gross value of farm production went up about 140%. Hoping to extend this agriculture buoyancy into the post-war years, the government aided in the construction of creameries.

With its very extensive coast line, and possessing the largest smelt fishery in North America and the largest sardine cannery in the British empire, it was surprising that during the 1937-46 decade only about 5% of New Brunswick's production was from fishing. One of the first acts of the industry and reconstruction department was the creation of a fisheries division which in turn set up a Fisherman's Loan board backed by a fund of \$150,000 from which fishermen borrowed money to modernize equipment.

The modest industrial expansion in New Brunswick also created a modest expansion in electric energy consumption, bringing realization that the future of the province depended on adequate cheap electric power. In 1946 the government made a start on a \$10,000,000 hydroelectric development program. Use of tidal power, however, got no further than the experimental stages.

During the early part of the 1937-46 decade, New Brunswick was only partially aware of the value of its tourist trade. The unexpected rush of tourists during the first full postwar season of 1946 brought out its potentials, and the government began a \$10,000,000 road-improvement program to help increase the province's attraction for outsiders.

Transportation facilities developed during the decade. In 1939 Shediac became a port of call for the first trans-Atlantic mail route, and Moncton became a depot of the Trans-Canada airlines coast-to-coast service. During the war, Saint John was one of the major bases of the "bridge of ships" across the submarine-infested Atlantic. In 1946 the Canadian Pacific steamship "Princess" plying across the Bay of Fundy between Saint John and Digby, installed radar, the first Canadian commercial vessel to use this war-born miracle. In 1945 the Canadian Broadcasting corporation opened its 19-metre band short-wave station at Sackville, the strongest North American station at the time of its opening.

Although New Brunswick's share of the national income during the 1937-46 decade grew from \$233 to \$500 per capita, Canadians in all the other provinces used more radios, and in all the other provinces but one used more telephones and cars. Nevertheless, neither the provincial government nor any of the municipal governments failed to meet full financial obligations. (C. Cy.)

New Deal

Practically every important political manoeuvre and speech of the 1946 congressional campaign in the U.S. took it for granted that there had been a New Deal. Republicans generally regarded the New Deal as something to be modified but not entirely abandoned: certain "social gains" should be kept, but the budget should be balanced, taxes should be lowered, the Wagner act should be altered to permit industry to have its say in the collective bargaining arena and there should be less planning and more freedom of enterprise. Only in the realm of foreign policy did the Republicans defer to the Democrats—the bipartisan approach should be continued here. But the "firmness toward Russia" tone of bipartisanship was as much Republican as Democratic—indeed, the Henry Wallace-Claude Pepper Democrats were not convinced that Secretary of State James F. Byrnes was carrying out the "Roosevelt policy" at all.

If the New Deal is properly to be deduced from the number of things which the Republicans swore to modify, it may be said to have consisted of public spending, high taxes, favouritism to labour and excessive government interference in business and production. But this is to judge the New Deal on the plane of sentiments and events, not ultimate philosophy. The attempt to pin down the philosophy of the New Deal is far more difficult than any recital of campaign promises or negations would lead one to believe. For the New Deal was not one New Deal but many New Deals. At its head and fount was an enigmatic and contradictory personality: Franklin D. Roosevelt, four-time president of the United States. Rooseveltians who swore by their leader often swore vindictively at each other, and always in the name of the New Deal. A pragmatic man who knew how to build up personal power on a balance of opposites, Roosevelt encouraged the conflicts that went on about him and below him. He found it useful to have many points of view on tap. Inasmuch as the party he had to manage was a loosely-knit congeries of dissident groups, regional blocs and personalities, it was convenient to have something or someone on hand to please everybody. A man with a nicely articulated economic philosophy could never have kept a firm rein on southern cotton growers and Harlem Negroes, Georgia Baptists and Boston Irish Catholics, Pittsburgh steelworkers and California walnut ranchers, young intellectuals from the law schools and anti-intellectuals from the piney woods of Mississippi. But Roosevelt, a pragmatic, eupeptic man with a pleasant personality, an ability to sleep well of nights and a willingness to try anything once, actually did manage to hold his heterogeneous following together for a little more than 12 years.

Business, the Whipping Boy.—How did he do it? The mystery is more or less explained by isolating the dominant sentiment of the 1930s, which was distrust of the business community. True, Roosevelt deferred to business leadership after the war crisis had grown to sizable proportions. But that was after "Dr. New Deal" had been dismissed "for the duration" in favour of "Dr. Win-the-War." A few of the Roosevelt followers denounced this as shameful surrender to "reaction." But most of them went along with the boss for the obvious reason that war production

depended on co-operation with the top production men. When it was all over, they argued, "Dr. New Deal" would take over once more.

The early New Deal crusade was dedicated to driving "the money changers" out of the temple. Since practically everybody resented the grueling aftermath of the 1929 Wall street crash, it was easy to unite the owner of a mortgaged farm, the unemployed city worker, the bankrupted small-business man, the young lawyer without a future and the college president without a source of new endowment funds on a basic platform of enmity toward the business overlords of the 1920s. The business men had let their system get out of hand; let them take the consequences. But enmity is a feeling, a sentiment, not a philosophy. When it came to building a program of action on the ground-level of sentiment, the philosophers of the New Deal found themselves rearing a tower of Babel.

Antitheses.—To understand what came after 1937 in the New Deal, one must review the trend of the first Rooseveltian term. The original Roosevelt "Brain Trust" included many proponents of the new creed of "planning." There was Rexford Guy Tugwell, a Columbia university professor who believed in integrating the industrial system along corporate lines, with a complex series of interrelated controls over prices, wages, hours-of-work and new investments. There was Raymond Moley, another Columbia university man who drew the logical conclusion that Tugwellian planning meant "control of the border"—i.e., economic nationalism. (One can hardly hope to regulate an internal price level without regulating imports and exports and the impact of foreign currencies on one's own.) The Moley-Tugwell group, however, had to fight it out with Secretary of State Cordell Hull, an old-fashioned Free Trader, and with Democrats who believed in the enforcement of the antitrust acts and the removal of barriers to competition. With the jettisoning of the London Economic conference and the passage of the National Industrial Recovery act, it was apparent that Tugwellian "planning" had won; the U.S. industrial machine was henceforward to be run under a series of codes, with competition and new investment kept within certain bounds, and with labour getting its share of the fruits of "planning" in the form of a guaranteed minimum. The unemployed were to be taken care of by PWA (Public Works authority) and by WPA (the Works Progress administration). As for the farmer, AAA (Agricultural Adjustment administration) crop limitations and bounties for co-operating in certain soil conservation practices were to underwrite him.

The National Recovery administration, which was set up under the terms of the National Industrial Recovery act, had to depend on voluntary compliance, inasmuch as its boss, Gen. Hugh ("Iron Pants") Johnson, had no budget for an industrial police force. And voluntary compliance wasn't enough: the NRA Blue Eagle was a dead bird even before the supreme court decision in the Schechter case effectively outlawed NRA-ism. The National Industrial Recovery act, however, was to have its permanent effect on the philosophy of the New Deal, for under its famous section 7A, which guaranteed labour the right to organize for collective bargaining, John L. Lewis rebuilt his moribund United Mine Workers into an instrument of great power. By the time a second Rooseveltian term had rolled around, the C.I.O. had split off from the A.F. of L. and was ready to do its bargaining business in the mass production industries, with Lewis acting as the boss negotiator.

From 1937 until the coming of the war to the United States in 1941, the C.I.O. was a dominating influence on New Deal philosophy. In 1937, the C.I.O. pushed its big

organizing drives in steel and automobiles; civil war threatened as a result of this, but Governor Frank Murphy refused to let troops be used against sit-down strikers in Michigan, and Myron Taylor of U.S. Steel suddenly and dramatically agreed to deal with Lewis and his Steel Workers Organizing committee. The so-called "Little Steel" strike kept hatreds boiling in 1937, and when Roosevelt dismissed both Tom Girdler of Republic Steel and John L. Lewis with a "pox on both your houses," he made a mortal enemy of Lewis. But labour as a whole stuck by Roosevelt, and the action of U.S. Steel in agreeing to deal with the C.I.O. firmly established collective bargaining as a fundamental pillar of New Dealism.

The other pillar of New Dealism in the late 1930s was trust-busting, which was the very antithesis of the NRA-ism of the first New Deal. Defeated by events and the supreme court in his ambition to set up what can only be described as a quasi-corporative state, Roosevelt, as the resourceful quarterback of his own figure of speech, decided to revert to an antimonopoly line. Before he did this, he took an ill-fated flyer in the unsuccessful attempt to pack the supreme court. If he had gotten his new court in one fell swoop, Roosevelt might have tried to revive the principle underlying the NRA. Lacking the legal basis for a suspension of the Sherman and Clayton antitrust legislation, however, Roosevelt began to listen to those who whispered to him that an antimonopoly crusade might effectively result in limbering up the capitalist system of production.

The antimonopoly fight began in late 1937, when the so-called "inventory depression" began to take hold. But it began in an atmosphere of philosophical confusion that had not been wholly dissipated by the end of 1946. Even when Robert H. Jackson, who preceded Thurman Arnold as chief trust buster in the department of justice, was busy denouncing monopoly, the New Deal was still promoting price supports in agriculture and in the coal business. Harold Ickes, the secretary of the interior, continued to advocate oil conservation at a time when federal prosecutors were accusing 16 oil companies in Wisconsin of conspiring to keep prices up (and the over-all consumption of gasoline down). To help clear away the fog, the TNEC—or Temporary National Economic committee—was set up, with Leon Henderson, a Securities Exchange commissioner, in charge. The avowed aim of TNEC was to discover just how and to what extent the U.S. economic system had become a victim of the stiffnesses of old age. Whether the TNEC achieved its aim or not was not decided; the war came along to pump money into the U.S. productive circuit, and the findings of the TNEC did not receive sufficient analysis to show just what they were worth. Meanwhile, however, Thurman Arnold had succeeded to Robert Jackson's job as chief trust buster—and the vigorous campaign which Arnold put on was an undoubted deterrent to price-fixers. As a matter of fact, Leon Henderson's own lung power may have been instrumental in keeping U.S. Steel from leading the steel industry in a general price rise in the late 1930s. Nothing could be proved, but it was a fact that Henderson did yell about price stiffness, and it was also a fact that U.S. Steel did resist the temptation to raise its prices at a time when Henderson was yelling.

Whether Franklin D. Roosevelt, as the chief New Dealer, ever succeeded in making up his mind between the NRA and the trust-busting approaches is doubtful; Frances Perkins, in *The Roosevelt I Knew*, indicated that Roosevelt never really understood economics, and Leon Henderson once admitted the difficulty of explaining to his boss just what made an economic system tick. In the matter of pub-

lic spending, Rooseveltian words could be found to support any position. In a speech delivered on Oct. 9, 1932, Roosevelt accused Herbert Hoover of having unbalanced the budget. The Democratic platform of 1932 supported the principle of budget balancing. Yet, during the first two Rooseveltian terms, the only economic constant at work was the federal "pump-priming" policy; whenever an economic recession threatened, the sluices of public spending and "government investment" were opened. And when the war came the spending became a torrent; taxation could not keep pace with it, and a national debt of about \$260,000,000,000 resulted. The national debt created by the exigencies of war and "lend-lease" was not a product of any conscious fiscal philosophy, Keynesian or otherwise. But its size might have been less if the New Deal of the late 1930s had had a stricter approach to the problem of the budget. As politicians, the New Dealers, like the Republicans before them, believed in the practical philosophy of "never voting for a tax bill or against an appropriation."

"Maturism."—While economic New Dealism had veered between the polar extremes of NRA and trust-busting, and between the economic nationalism of a Raymond Moley and the economic internationalism of a Cordell Hull or a Will Clayton, New Dealers were generally united in the belief that the U.S. economy had reached a stage of "maturity" that precluded any new *spontaneous* enlargement. Taking their cue from Englishman John Maynard Keynes and Alvin Hansen of the U.S., Roosevelt's intellectual advisers of both NRA and trust-busting faiths argued that "over-saving" and "under-investment" must henceforward be the chronic manifestations of the U.S. economy as long as the government refused to do its own "investing" in time of crisis. The opponents of the New Deal argued all along that the lack of private investment opportunities was a direct result of New Deal spending and taxing policies; in a world that frowned on the idea that an individual is entitled to keep more than a small proportion of what he makes, there was not much incentive to risk the untaxed cash that one already had in the bank. When state investments in war industry and war production took over in the early 1940s, there was no opportunity for the "maturists" and the "antimaturists" to fight out their battles under conditions that might be capable of proving the case one way or another. But the arguments over the theory of the mature economy went on during the war. When George Terborgh, in his *The Bogy of a Mature Economy*, boldly assembled his statistics to prove that new investment fields still beckoned, no New Dealer of note stepped up to refute the evidence. But "mature economy" thinking still permeated the various full employment bills which New Dealers kept introducing in congress up to 1946. The Republicans and the anti-New Deal southern Democrats finally succeeded in emasculating the New Dealers' idea of a proper full employment bill. But the "maturists" were almost certain to reopen the fight in the event of another "recession."

If the war had not come in Europe, the 1940 presidential campaign would very likely have been fought out over the issue of the "mature economy" pessimism of the New Deal philosophers. Certainly Wendell Willkie, who complained that Washington had become the only boom town in the whole U.S. under New Deal ministrations, was willing to fight it out along that line. The events in Europe, however, would not allow the voters to concentrate on domestic issues.

New Internationalism.—Although interventionist Democrats were quick to accuse the Republicans of being the

party of noninterventionism, both parties were forced into ambivalent positions by the record of the past. In 1937, Roosevelt floated a trial balloon in his famous "quarantine-the-aggressors" speech. But the reaction was a dud; some commentators even went so far as to accuse Roosevelt of using the international issue as an excuse to get people's minds off the appointment of Senator Hugo Black to the supreme court. Unable to arouse the nation to the menace of the fascist dictators, Roosevelt reverted to a generally passive foreign policy. He himself had followed a noninterventionist line in the early days of the New Deal. Item one: he had repudiated the League of Nations in order to get Hearst support in 1932. Item two: he had agreed to the "neutrality" legislation of the early- and mid-'30s, with its "cash-and-carry" and embargo provisions. Item three: he had acquiesced in the congressional investigations which sought to pin the blame for U.S. participation in World War I on the bankers and the munitions makers. Item four: his repudiation of the Cordell Hull line at the London Economic conference in 1933 was a factor in pushing the entire world into more intensive economic nationalism.

No doubt the pre-1937 noninterventionism of Roosevelt failed to represent his actual feelings—or his actual philosophical position. But throughout 1939, 1940 and 1941 it continued to betray him into ambiguous words and actions. In 1940 he promised, in his famous "again and again and again" speech, that U.S. boys would not be sent to fight in any foreign wars. But in 1941 he fought hard for the lend-lease program and for other "short-of-war" measures, and in late 1941, even before Pearl Harbor, the U.S. navy had orders to fire upon German submarines if they threatened to interfere with the conveying of lend-lease goods to Britain. The Roosevelt attempt to face up to the dictators was an essential part of latter-day New Deal philosophy. But U.S. action vis-à-vis Adolf Hitler and the Japanese was made jerky, unpredictable and confusing because of the hangovers of the earlier noninterventionist thinking of New Dealers. Thus the economic nationalism of the first, or pre-1937, New Deal lived on to plague the internationalism of the dominant New Dealers of 1940–41. Some "nationalist" New Dealers—Jerome Frank, Harry Hopkins, Rexford Tugwell—swung over to support the boss New Dealer in his new international position. But other early New Deal proponents—Senator Robert La Follette, Jr., of Wisconsin was one—quietly indicated their displeasure at the new turn of events.

The war quickly produced the "global" New Dealer—one who would extend the principle of Tennessee Valley authority river development to the basins of the Danube and the Yangtze. It also brought the "controlled economy" type of political philosopher back into Washington. Although NRA had been killed beyond resurrection by the supreme court, the essential practices of NRA—wage, price and investment controls—came back as a practical wartime necessity. When the shooting was over, the control-minded philosophers made the continuance of price control a test of New Dealism. Chester Bowles, who headed the Office of Price Administration during the last days of war and the first days of peace, resigned in a battle over the issue; and the followers of Bowles forthwith accused Pres. Harry S. Truman and his advisers of having deserted the Rooseveltian philosophy. Other prominent New Dealers—Harold Ickes, Henry Wallace—faded out of Washington in 1946. But the Truman Democrats insisted there would be no retreat from the "social gains" or the humanitarianism of

the New Deal, and the Republicans showed no disposition to abolish such things as the Truth-in-Securities legislation, the Securities Exchange commission, the Tennessee Valley authority, the principle of social security and the right of labour to organize for collective bargaining purposes. If these constituted the nub of "New Dealism," the New Deal had apparently come to stay. And if the new internationalism—or "participation" in the United Nations and other international bodies—was a strictly New Deal phenomenon, that had come to stay, too.

Common Denominator.—Looking for a common factor in the various speeches, articles and acts of New Dealers from 1937 to 1946, just one thing stands out. The common factor is reliance on the state to fill a gap, plug a hole or put out a fire whenever any ponderable group of citizens was in trouble. The U.S. was a subsidy economy to a not inconsiderable degree long before the advent of the New Deal, as the history of railroad land grants, pork-barrel bills and the protective tariff goes to prove. And in the Hoover days, from 1929 to 1933, the Reconstruction Finance corporation and the Farm board undertook to bring help to distressed business men and farmers. What the New Dealers did was to magnify and glorify what was already being done, and to extend it downward until it had reached all levels of the population. Help to the unemployed, aid for struggling artists, cheap public power for farmers, Tennessee Valley phosphorus for worn-out land, loans to Henry Kaiser for new industrial ventures—the New Deal undertook to provide them all. Through the mechanisms of the Import-Export bank and the Bretton Woods international currency arrangements, it also undertook to extend the subsidy principle to other nations. Whether it would all work out or not depended on the will to master the complex factors that go to make up good budget management and wise manipulation of the taxing power over a long cycle of time.

To the end of the decade, the U.S. congress had given no evidence that it could master these factors. But New Dealers lived in hope.

In any event, what the U.S. had left after the New Deal was not so much a new philosophy as a new set of facts. It had a more precarious economy and a more costly and cumbersome government. But it had also learned a lot about itself. The per capita public debt had risen, but to offset this the U.S. people had learned how to conserve their soil, how to reforest their landscape and how to control their rivers. Whether the U.S. knew enough to keep clear of an excessive statism still remained to be seen. Although elected four times, Roosevelt, the chief New Dealer, refused to entertain the idea of becoming a dictator, even though many of the tools useful to dictatorship were forged during his terms in office. Under the New Deal, there was much talk of "due process of administration"—i.e., government by decree. Generally speaking, the New Dealers were impatient with congress; they wanted to see power placed in the hands of administrative agencies. The U.S. people were now in the process of revolt against administrative assumption of power. The swing was away from this aspect of the New Deal. If the swing was shortly to reverse itself again, the New Deal might seem in retrospect to have been part of an irresistible world tide toward universal collectivism. And the original Tugwellian New Dealers, not the trust-busting New Dealers of the Thurman Arnold period, would have won the day. (J. CH.)

Regulation by Government

The decade 1937-46 in the United States covered (a) the closing phase of one great crisis—the economic depression beginning in 1929, (b) all of World War II and (c) some of the aftermath of that war. The decade followed a period of crisis in which government controls had been indefinitely extended. From 1937 until the approach of war, there was no substantial extension, but rather a consolidation of the controls previously established. With the advent of the war there was a tremendous increase in controls, to a point far beyond anything heretofore experienced in the United States, and approaching almost a complete regulation of individual life, local government activity and all industry and commerce. Subsequently, there was a steady relaxation of wartime restrictions, and by the end of the decade it seemed as if the United States might return to substantially the same state of government control which existed just prior to World War II. In one field, perhaps, that of foreign trade, because of the abnormal conditions existing throughout the world, and a tendency of other governments to control their trade, increased control might be a permanent result of the war period.

The Prewar Period.—The opening of the decade found most of the depression-born agencies of governmental control already in operation in the United States. By 1937 such agencies as the Securities and Exchange commission (SEC), the National Labor Relations board (NLRB) and the Tennessee Valley authority, were established and operating. Emergency agencies such as the National Industrial Recovery board and the Federal Civil Works administration, had already ended their brief lives, and the first Agricultural Adjustment act had been declared unconstitutional. The Works Progress (later Work Projects) administration was in operation and destined to continue for some years more. Old-age insurance was a reality, with payments due to begin shortly, and the Reciprocal Trade Agreements act of 1934 had given the president certain arbitrary powers to reduce tariff rates. It was against this background of existing government powers that the 1937-46 decade must be viewed.

Foreign Controls.—Although in the field of foreign relations, the impact of the impending war came to be felt much earlier than in the domestic life of the United States, nevertheless there were federal controls of note during the period which belonged more to the peacetime interval between the two wars than to the war period itself.

There was a series of neutrality acts, beginning in 1935, based upon the general popular resolve "to stay out of the next war." The 1937 act increased the governmental restrictions in this sphere. It provided that when the president found that a state of war existed, there should be instituted an embargo on arms, and such other articles as the president determined, to belligerents. The act also made illegal any financial transaction in the securities of a belligerent nation or subdivision. A National Munitions Control board was established to ad-

minister the act, and all persons engaged in the business of manufacturing, exporting or importing munitions of war were required to register. The arming of U.S. vessels was prohibited, and travel by U.S. citizens on vessels of belligerent states was made unlawful. Other controls for similar purpose were provided. These neutrality acts were modified as the United States' entry into World War II came closer, and they were finally repealed. Other and different controls on foreign activities were then imposed which belonged more properly to the war period.

A corollary to the neutrality acts was the resolution passed at the beginning of 1937 making it a criminal offense to export arms or implements of war from the United States to Spain, where a civil war was raging. This embargo applied equally to both factions in the Spanish dispute.

Industry Controls.—During the prewar period after 1937, a few additional controls were imposed on industry. Thus, in 1937, congress passed the so-called Guffey-Vinson Coal act, giving the government power to promulgate a Bituminous Coal act of fair marketing rules and minimum prices, and a tax was levied upon producers who did not accept the code provisions. This was the most extreme regulation of any industry, other than public utilities, which the country had seen in time of peace. The act expired in 1943, at which time full wartime controls were in effect. With the expiration of those controls, there was no longer any special regulation.

Certain unfair methods of competition, rendered illegal by the Federal Trade Commission act, had been subjected to control by that commission since 1914. However, the Wheeler-Lea act, passed in 1938, considerably enlarged the commission's powers to deal with false advertising of foods, drugs, cosmetics and devices, and also to cover additional unfair or deceptive acts or practices in interstate trade. Then in 1941 the commission was also charged with administration of the Wool Products Labeling act, which required wool products to be fully and truthfully labelled to reveal their exact fibre content.

Another subject of regulation, in effect since 1906, was the labelling of foods and drugs. The earlier act on this subject was directed toward promoting purity, standard potency, and truthful and informative labelling of the commodities covered. In 1938 the Federal Food, Drug and Cosmetic act broadened the list of items covered and considerably tightened the machinery for effectuating the purposes of the act.

Two individual industries were also brought under strict governmental regulation in the United States during this period. These were the natural gas industry and the fast-growing civil aviation industry.

Prior to 1938 the Federal Power commission (FPC) had been regulating electric utilities operating in interstate commerce. In June of that year, the commission's jurisdiction was extended to the control of natural gas companies operating interstate. Wide regulatory authority was given over rates and distribution of natural gas. The extension of federal control to natural gas was not any substantial change in policy, since such gas was, as a rule, sold for domestic purposes to public utility companies having a monopoly of distribution, and this regulation, therefore, was no more than an extension of the general principle of public utility regulation.

Another special field entered by the federal government during this period was the control of commercial aviation. Such control became absolutely essential if the

airways were to remain safe and development proceed in a reasonably ordered way. The Civil Aeronautics act of 1938 created the first Civil Aeronautics authority with wide powers in policing the airways and landing areas, prescribing safety standards, setting rates and making regulations for the financial and operational control of the aeronautics industry.

Financial Controls.—The government had always undertaken a general regulation of banking activities, both in connection with its own fiscal operations, and in order to protect the public in a field where unregulated activity might easily lead to fraud. As a result of the depression, federal controls extended to the whole field of the issue of securities and their marketing, including the large stock exchanges. This led further to a specific regulation of public utility financing in which severe abuses had arisen.

The Securities and Exchange commission (SEC) was well launched in its activities before the decade began. However, several additional financial controls were imposed during this period. In 1938 the SEC's jurisdiction was extended to "over-the-counter" brokers and dealers who were required to register and adhere to the regulations prescribed. A year later the SEC's powers were further extended in the Trust Indenture act of 1939 to cover bonds, notes, debentures and other certificates of indebtedness, in order to protect investors. Finally in 1940 the SEC was authorized to control the activities of investment trusts, investment companies and investment advisers. By these acts virtually the whole of the financial community became subject to governmental supervision and control.

Agriculture.—The first Agricultural Adjustment act had been declared unconstitutional by the supreme court in 1936. Similar controls, however, were gradually reimposed, first as applied to sugar by the Sugar act of 1937, which empowered the secretary of agriculture to allot quotas of sugar production, provide benefit payments and make stipulations respecting the employment of labour. By 1938 a new Agricultural Adjustment administration was in effect, providing for sweeping controls of production with its concept of the "ever-normal granary." By vote of the farmers concerned, but practically in accordance with a government-declared policy, limitations were placed on the production of many essential products, acreage was limited and a very close regulation imposed on farmers in general. In the dairy industry, various marketing control acts amounted practically to price fixing of dairy products by areas.

Labour.—During the depression, in 1935, the National Labor Relations act imposed a new concept of regulations on labour relations. It forbade the employer to interfere with the formation of unions. It required him to bargain with a representative of a majority of his employees and not to bargain with any other employees. It imposed, therefore, a serious restriction on the right of employers to deal directly with their employees and forced them to accept representation by men selected by a majority of employees. Through the power of designating the bargaining unit, the government was able to destroy one union and build up another. Through the encouragement of the closed shop, employees were generally forced to join unions whether they wished to or not. The administration of the act by the National Labor Relations board limited the free speech of employers and their activity in many other ways in dealing with employees.

This regulation grew through the decisions of the board and the courts during the prewar period. During this period also, the Fair Labor Standards act of 1938 extended the regulation of employers. It established maximum hours of labour and minimum wages with compulsory overtime after 40 hours. It also outlawed oppressive child labour as defined by the children's bureau. The act was administered by a wages and hours division in the department of labour, and required an extensive and detailed investigation and regulation of industrial employers and many others.

Relief and Social Security.—During this period, some governmental controls were expiring. Most of these were the emergency relief activities of the early '30s. The Federal Emergency Relief administration expired in 1938; the Work Projects administration in 1942; emergency conservation work, which later became the Civilian Conservation corps, was ended in 1943 and the Public Works administration was being liquidated by the Federal Works agency that same year. The so-called Social Security program, first enacted in 1935, was amended and extended in 1939. In part, this program simply provided aid to the states to furnish relief for the aged, for widowed mothers, for the blind, for crippled children and for other special groups. Its old-age insurance features, however, amounted to a real extension of government controls, because it compelled all employees in the United States, with limited exceptions such as agricultural workers and domestic servants, to enter the system and have deductions from their pay rolls made to pay the insurance. Tremendous statistical operations were necessary, and the detailed features of the insurance for the aged and for survivors were definitely fixed by statute in accordance with government policy.

Wartime.—The imminence of war, its outbreak in Europe in 1939 and the entry of the United States into it in Dec. 1941, brought a host of new government controls more far-reaching than the nation had ever experienced before. No important aspect of the people's activity completely escaped the effects of this regulation.

Although ultimately all government regulation is designed to control individuals, most restrictions affect them primarily as members of some economic group, such as farmers, employers, wage earners, or taxpayers. This principle no longer applied when war became imminent.

The most obvious example of direct controls over the individual in the United States was Selective Service, which at first subjected men between the ages of 21 and 36 to military conscription for 1 year. By subsequent extensions and modifications, men from 18 to 64 were required to register, and those 18 to 45 became liable for military service. Limits as to length of service and overseas duty were dropped after the United States' entry into World War II. After the war ended, more limitations were again introduced, and the act was allowed to expire on March 31, 1947.

Government mobilization of men for the armed forces was direct. Only a little less direct was the mobilization of labour into war production work. As the army and navy drafted more and more of the nation's manpower, the war industries, also expanding, found their labour supply growing constantly shorter. To remedy this the government, acting through the War Manpower commission, took three successively more drastic steps. First was federal operation of the United States Employment service, which acted as a clearing house to place workers in essential jobs. The second step came in Dec. 1942, with the incorporation of the Selective Service system into the

War Manpower commission, and the substitution of "essentiality of employment" for dependency as a basis of draft deferment. Finally in April 1943 a blanket order was issued "freezing" essential agricultural and industrial workers in their jobs. Efforts to extend the draft of men for civilian work, however, failed when congress rejected the "Work or Fight" bill in 1945. All controls were abandoned soon after World War II ended.

The civil liberties of individuals in the United States were also subject to control, though not nearly to the extent experienced in other countries. A sedition law was made part of the Alien Registration act of 1940, and upon the United States entrance into World War II, a strict wartime censorship was imposed. The Office of Censorship examined all communications passing between the United States and any foreign country. In addition the office issued a set of principles to be used as a "voluntary" censorship code for the domestic press and radio. One of the first casualties of the Allied victory, this domestic censorship was terminated on Aug. 15, 1945, and the office and its remaining functions were abolished on Sept. 28.

Censorship is essentially negative in character. Its positive side is propaganda, and this is perhaps the most dangerous control of all because it attempts to channel and direct the individual's thinking. During World War II a centralized information bureau, the Office of War Information (OWI), carried out projects designed to provide both in the United States and overseas an understanding of the progress of the war effort and of the war policies, aims and problems of the government. The OWI was subjected to severe criticism on the grounds that it did not present the facts but only what it considered to be good for the people's morale, and was also actually propagandizing the partisan program of the administration in power. Its existence was terminated on Aug. 31, 1945, by executive order.

The individual in the United States, regardless of his economic status, was also directly affected by the wartime rationing of scarce consumer commodities. The purpose of rationing, of course, was to ensure a fair distribution of goods which were in scarce supply during World War II. Rationing was applied to automobiles, tires, bicycles, typewriters, fuel oil, gasoline, shoes, sugar, coffee, canned, dried and frozen fruits, vegetables, and fruit juices, meat (excluding poultry), butter and cheese. By the end of the decade, however, only sugar remained on the ration list.

Another control of little importance, but one which affected the entire population, was the imposition of daylight saving time for the duration of World War II in order to spread the hours of daylight more evenly through the working day, and thereby save fuel used for lighting. Soon after the war, this control too was abandoned by act of congress, standard time was restored, and different localities were again free to retain standard time or adopt daylight saving time as they saw fit.

Industry.—Government controls on industry in the United States were directed toward two major ends: first, and foremost, the production of essential materials for the war effort, and, second, reduction of the dangers of inflation inherent in a situation when normal production of civilian consumer goods was curtailed while high wartime incomes enlarged the public's purchasing power.

Conversion of industrial plants to production of war materials was begun before the United States entered the war. However, this was done on a piecemeal, plant-by-plant basis, under the guidance of the Office of Production Management (OPM). In Jan. 1942 however, the program was accelerated greatly by the War Production

board (WPB), which ordered a complete stoppage of automobile production the following month. Shortly thereafter many other industries received orders to convert to war production, and for the duration of World War II, production of civilian radios, washing machines, phonographs, metal office equipment and other similar commodities was stopped.

Outright requisition or commandeering of industrial resources was an even more stringent form of wartime control exercised over industry. Power to make such seizure was given to the president in cases where the plant or equipment was needed for defense and where the need was immediate with other sources unavailable. Later this power of requisition was also extended to essential war production which was halted because of a labour dispute. The power of requisition was applied in the case of aircraft plants, shipyards, coal mines, railroads and other activities less directly connected with the war effort. At the close of the decade the government was still operating the nation's bituminous coal mines, which had been shut down by a strike in 1946.

Another form of regulation of industry was provided by the elaborate system of priorities and allocations administered during World War II by the WPB. The major purpose of this program was to establish relative priorities on the uses of scarce commodities in order to insure the direction of the limited supply to the most vital needs. Allocations of these commodities were a natural counterpart of the priorities system, so that each user of scarce materials would receive the volume of each material to which he was entitled, and have some knowledge of what to expect.

The main control placed upon business in the United States in order to curb the inflation threat was price-fixing. The Emergency Price Control act of 1942 contemplated a selective price control setting ceilings on certain essential articles affecting materially the cost of living. The administration, however, was not satisfied with the results, and in 1943, under the powers conferred by the Stabilization act of 1942, a general freeze of all prices was put into effect by the Office of Price Administration. When strains became too great, subsidies were granted which reached a rate of nearly 2,000,000,000 a year at their height. These subsidies proved an effective method of completely regulating the industries so benefited; they became so dependent on the subsidies for existence that they were obliged to comply with all orders of the government, whether or not the orders were lawful. At the same time the National War Labor board was set up, and a general freeze of wages was attempted at a level of 15% over the wages at the beginning of 1941. In general the price freeze was superficially successful, with only a 2% increase in the cost of living over a two-year period. The attempt to freeze wages was not equally successful, and hourly rates during the same time increased by 10%. This wartime result was in no little measure due to the wholehearted co-operation of the public during World War II, and while some black markets existed, they were not an important factor in their general economic effect.

At the end of the European war in 1945, however, the strains of price control became much more difficult because of the increased costs resulting from inability to hold wage rates and the increased cost of many raw materials. Furthermore, popular desire to return to a free economy asserted itself, and black markets became rampant. In many fields, price control became still more impossible during

the winter of 1945-46 when the president approved a general increase in wages and salaries which generally amounted to about 20%. By the end of 1946 price control had been completely abandoned except as to sugar, rice and rentals. Control of rentals was particularly severe, because it was easier to enforce, but it was possible to enforce it only by arbitrary rules which gave little justice to many individual property owners.

The dual problem of stimulating production, and at the same time keeping prices in check, was also attacked by the granting of subsidies on critically short materials such as meat, dairy products, petroleum, rubber, strategic metals and many foods. In this way, when the ceiling prices provided insufficient profits to encourage the needed production for war use, government subsidies were used to bridge the gap.

Control over the production of necessary commodities needed for World War II was, of course, much more complete than it was in industries operating for civilian production. Not only was such production subject to the fixing of prices, but it was practically directed by the government through the leasing of government-built plants and the loaning of money to private concerns for necessary expansion. These industries were operated almost as if they were government directed. Operating in their own special fields, the Rubber Reserve company controlled all rubber supplies in the United States; the United States Maritime commission constructed the bulk of the merchant marine built up during the war and the Metals Reserve company acquired and dealt in strategic and critical metals and minerals needed for the war program. Many other commodities were dealt in directly by the government.

As an aid to all the foregoing business controls, complete regulation of imports and exports was undertaken by the government at an early date. A rigid system of export licences was imposed by the Board of Economic Warfare. At the conclusion of the decade such licences were still required, but were being issued by the Office of International Trade upon a considerably reduced list of goods.

In the field of transportation, wartime government controls were imposed by the Office of Defense Transportation to aid wartime industry by assuring the maximum utilization of the transportation facilities of the nation for the successful prosecution of World War II. Control of the allocation of boxcars continued long after the end of the war.

Labour.—In matters affecting labour, United States government controls were imposed for four major purposes; providing manpower for the armed forces; utilizing the civilian labour force as efficiently as possible for war production; keeping the productive forces of the nation in operation; and preventing inflation. Soon after the Pearl Harbor attack, the president summoned a joint meeting of employers and employees and demanded that they agree on a course of procedure which would maintain uninterrupted production. A partial agreement was obtained, the results of which were reflected in a decreased number of strikes during the war. The agreement expressed a willingness to abide by the decision of a government board, and such boards were established. After several different plans, the National War Labor board assumed complete control of the enforcement of this so-called agreement, together with the enforcement of the Stabilization act as to wages. The board undertook to fix wages and to settle

all other questions which might arise between employers and employees leading to industrial strife. Over the protest of employers, the board also decided questions relating to the closed shop and maintenance of membership. Whether the employers agreed or not, they acquiesced in the decision, and the unions in general, with some notable exceptions, kept their no-strike pledge.

When strikes began to become more frequent and finally a nation-wide strike of bituminous coal workers was called in 1943, congress passed the Smith-Connally act. This required a 30-day cooling-off period and a majority vote of workers before a strike could take effect in any war industry. It also authorized the president to seize and operate war plants. Heavy penalties were provided for labour leaders who instigated strikes in government-operated plants. A more drastic bill to deal with the coal and rail strikes of 1946 was demanded by the president, including the power to draft men to operate essential industries.

The strikes were settled, and no legislation of this nature was adopted.

Another phase of labour control, less closely related to war needs, was the development of the principle of fair employment practices to reduce hiring discrimination based on grounds of race, colour or religion. The wartime purpose of the Committee on Fair Employment Practice was to foster the greatest possible utilization of manpower when it was hampered by discrimination in employment.

Financial Controls.—The use in the United States of government power over banking and finance has already been mentioned. In addition, controls upon income were used, not only to help finance the war effort but also to prevent war profiteering and control inflation. A direct ceiling limitation of \$25,000 on individual salaries after taxes was ordered by the president in 1942, but this was soon abandoned in the face of widespread protest and doubtful legality. A more successful method was the imposition of a corporate excess profits tax which in extreme cases made a total tax of over 90%. High individual income taxes, especially in the upper brackets, were designed for the same purpose.

A unique form of regulation was authorized by the renegotiation statutes, which gave arbitrary power to government boards to fix a reasonable profit for war industries and confiscate the excess over such profit. While the boards had arbitrary power, they gradually came to adopt certain standards, but in view of the arbitrary power given, congress later furnished a general method of review. In effect, however, the renegotiation statute subjected all companies engaged in war production to a complete regulation of profits.

The volume of consumer credit available has a direct influence in increasing or decreasing inflation. During World War II the federal reserve system extended its control over credit, both from the banks, and in the form of installment sales to consumers. It also regulated the extent to which companies selling to consumers could extend credit at all.

These powers were gradually relaxed, but proposals were advanced to make them a permanent part of the U.S. credit control system.

Agriculture.—During World War II, most of the AAA controls on agricultural production were suspended because of the tremendous demand which was prepared to take all production. In fact, special inducements in subsidies were given to encourage production, and no effort spared to ensure high-level farm production. It was necessary to alleviate somewhat the draft on agricultural

labour through the deferment of essential farm workers. In general, the war resulted in less agricultural control rather than more.

Control of Science.—The principal scientific accomplishment of World War II years was the production of energy by atomic fission. The development of this process was wholly controlled by the governments of Canada, England and the United States acting together. The so-called Manhattan district of the United States army corps of engineers finally assumed complete control of research in the field of nuclear physics, and also took charge of the procurement and engineering features of the atomic bomb project.

Previously the research had been encouraged by the National Defense Research committee of the Office of Scientific Research and Development (OSRD). The OSRD also co-ordinated, encouraged and sometimes supported scientific and medical research in many other fields connected with war production. Radar, submarine and aeronautic devices, tropical diseases and medical research were examples of scientific projects co-ordinated and stimulated by the OSRD during World War II. In addition the office maintained a roster of scientifically trained manpower in the United States.

The Future of Government Controls.—Wartime controls were largely abandoned in the United States during the year and a half following the termination of hostilities. Where restrictions still remained, the outlook appeared bright at the end of the decade for their early termination. The few remaining rent and price controls were under heavy fire, and priorities and allocations were rapidly being abandoned, even in the critically short field of building materials, although the Emergency Housing Act of 1946 authorized the use of such controls to the end of the year 1947. Subsidies had practically been abandoned, except in the field of metals. The corporate excess profits tax had been repealed and renegotiation abandoned.

One exception to this tendency was the government's continued surveillance over the production and use of atomic energy, which, however, could be considered a special field.

There remained, however, a general attitude on the part of many to look to the federal government for the solution of every important national problem, and undoubtedly throughout the world the totalitarian concept was aggressively active. Unless vigorously contested, this would mean a steady increase in government controls. In the United States it could be combated principally by building up the importance of state and local governments, and confining federal action where insisted upon to financial assistance without government control.

Most active efforts to extend controls at the end of the decade 1937-46, however, related to further control of monopoly, of speculation and of business activities which had long been subjected to control in theory. Extensions of government controls in these fields and efforts to make them more effective could not be regarded as a general extension of government power. (See also BUDGETS, NATIONAL; LAW; UNITED STATES.) (Ro. A. T.)

Newfoundland and Labrador

A British colony, Newfoundland and Labrador temporarily renounced dominion status in 1933 because of financial difficulties. Newfoundland is situated off the coast of Labrador and Quebec; Labrador is situated on the northeast tip of the North American continent and extends from Blanc Sablon in the Strait of Belle Isle in the

south to Cape Chidley at the entrance to Hudson strait in the north. Area: Newfoundland, 42,734 sq.mi.; Labrador 110,000 sq.mi. Pop.: Newfoundland: (1935 census) 284,800; (1945 est.) 316,000; Labrador (1935 census) 4,716. Chief towns (1943 est.): St. John's (capital, 55,000); Corner Brook (12,500); Grand Falls (6,500); Bonaville (5,000). Religion: Roman Catholic (c. 94,000); Church of England (c. 93,000); United churches (c. 75,000). Governors: Vice-Admiral Sir Humphrey T. Walwyn (Oct. 1935-Jan. 1946); Sir Gordon Macdonald (after Jan. 1946).

Newfoundland made a tremendous contribution to World War II in relation to its size and potentiality and at the same time the war provided an economic stimulus which brought an extraordinary prosperity, in marked contrast to the poverty of the pre-1939 years. The aim of the commission of government in its reconstruction program was to secure for Newfoundland a means of livelihood less subject to the fluctuating influence of external economic conditions and in the year 1937 it appeared to have achieved a certain success. Exports and imports at \$51,900,000 (Canadian) were the highest since 1931; the total value of minerals exported created a record at \$8,000,000 and large deposits of hematite were discovered in Labrador. The progress of agricultural development was encouraging and the fisheries, while still far from being on a sound economic basis, showed signs of improvement. The Newfoundland railway achieved an excess of revenue over expenditure for the first time since 1923. The decrease of roughly 6,000 in the number of families on relief in Sept. 1937 compared with Sept. 1936 was a further indication of improved economic conditions. The optimism engendered by these encouraging signs was, however, short-lived, and in the two succeeding years a slump in two of the country's principal industries, fishing and newsprint, reflected the instability of the world markets. The Spanish Civil War and Brazil's imposition of high import duties on fish resulted in a fall in the value of exports of dried cod which the expansion of trade with the West Indies by no means counteracted; at the same time the recession of trade in the U.S. caused a setback in the newspaper industry and logging. The resulting unemployment could not be offset by the government's special short-term reconstruction program and the mining industry alone continued to work at full capacity.

As the hopes of Newfoundland's recovery dwindled, discontent with government by commission became widespread. The commission was criticized for its lack of a sense of publicity, and many Newfoundlanders complained that they were cut off from the government ultimately responsible for their welfare by a bureaucratic wall. In Sept. 1938 Lord Edward Stanley, then British dominions secretary, was forced to postpone a visit he was scheduled to make to Newfoundland and this increased the sense of frustration felt by the people. More drastic measures of agriculture and rural reconstruction were essential and in the autumn of 1938 J. H. Gorvin was sent from London to make a survey of the possibilities in this direction; in July 1939 he was appointed head of the department of rural reconstruction. Main features of his policy were the institution of a regional supply and marketing scheme under which loans would be advanced to fishermen to replace the individual credits given by merchants, and the regional development corporation, which would distribute land in small holdings of three-acre lots. This policy could not bear fruit immediately, however. The announcement of an increase in the parliamentary grant-in-aid to New-

foundland from £680,000 for 1938-39 to £1,000,000 for 1939-40 gave proof, if any were needed, of the country's depression. At the same time it must be noted that the government's expenditure on reconstruction had steadily increased from \$618,000 in 1937-38 to \$2,563,000 in 1939-40, the biggest proportion of which was spent on the departments of natural resources and public works. Good work was done by the fisheries board (instituted in 1936) in stabilizing the industry as far as possible. Small sums were spent on education, health and public welfare and the standard of living remained deplorably low. The chief item on the credit of the commission's balance sheet was the increased efficiency of administration. Although revenue (excluding grants and loans) had crept up since the commission took office, expenditure had increased in greater proportion and the deficit in the year ending June 30, 1939, was \$4,100,000.

In spite of these adverse conditions, Newfoundland threw itself wholeheartedly into the war effort from the start. In the first eight months about 7,000 men had joined the services and in addition some 3,000 loggers volunteered for timber felling in Britain. Two artillery regiments of Newfoundlanders fought in the European campaigns and a Newfoundland night fighter squadron fought with the royal air force. Newfoundland casualties in the war were about 600.

In 1940 the government published for information and comment the Special Areas bill, which roused considerable criticism from the press and the board of trade (the equivalent of a chamber of commerce in Newfoundland). Then came the fall of France and the government withdrew the bill on the grounds that expenditure at that period would not be justified. Total expenditure was to be drastically cut down and revenue increased by heavier taxation and the sale of war savings certificates. Moreover, the government entered into a formal agreement not to ask Great Britain for any financial aid so long as the war lasted. Responsibility for service of the debts guaranteed by the British government was taken over by Newfoundland, war loans to raise the money being subscribed locally in less than a week.

In Sept. 1940 facilities were granted to the U.S. to establish bases on the Avalon peninsula and the southern coast, and on Jan. 29, 1941, the first U.S. troops landed on the island. The Canadian government assumed temporary control of the airports at Gander and Botwood and began construction of an airport at Goose bay, Labrador. By a protocol to the Anglo-American Bases agreement, March 27, 1941, the U.S. government was granted a 99-yr. lease to these bases and Canada, under the terms of an agreement concluded with the Newfoundland government, was also granted a 99-yr. lease of the Goose bay airport. Responsibility for Newfoundland's defense was in the hands of the U.S. and Canadian authorities but the Newfoundland government remained in charge of civil defense.

The construction of the bases brought a wave of prosperity and 1941-42 were boom years. Newfoundland men working on the bases were paid higher wages than they had ever earned previously and there was a sharp increase in both the standard and cost of living. The basic industries were at this time favourably affected by world conditions, so that in July 1941 the finance commissioner was able to announce a record total revenue for the year 1940-41 of \$16,200,000. The government made a free gift to Britain of \$500,000 to establish a squadron of fighter aircraft, and in addition \$2,300,000 was lent to Britain free

of interest for the duration of the war. In all, Newfoundland lent Britain more than \$12,000,000 during World War II. In Sept. 1942, Clement R. Attlee, then dominions secretary, visited Newfoundland. Now that the country was once more self-supporting it was inevitable that Newfoundlanders should again feel restive about their form of government. The temporary nature of the current prosperity was, however, generally realized, and from his conversations with various bodies of opinion Attlee came to the conclusion that there were considerable differences as to what kind of change, if any, should be made. The trades union group wanted immediate self-government, whereas the board of trade in March 1943 sent a petition to the king asking that a royal commission be set up to inquire into the constitutional and financial problems of the island. In May 1943 Attlee announced the sending of an informal parliamentary mission to Newfoundland to get a fuller knowledge of its war effort and the problems likely to face it at the end of the war. The mission spent the summer of 1943 in Newfoundland and each of the three members presented an informal report to the British government. A considerable amount of debating time in the house of commons was devoted to Newfoundland and on Dec. 2, 1943, and again on Dec. 16, the government made a statement of policy in which it pledged itself to restore responsible government when Newfoundland was self-supporting and at the request of the people; but because of the abnormal conditions which World War II had brought, no change could be made until the end of hostilities.

In the summer of 1944 three members of the commission of government visited Britain for consultation with the dominions secretary as to the best form of machinery through which the people could express their views. The unexpected delay in the defeat of Germany meant, however, that the machinery could not be set in motion as soon as was hoped, but some effort was made in 1945 to re-educate the Newfoundlanders in the arts of self-government by the encouragement of local councils. It was not until March 1946 that the dominions office announced that a national convention of 40 members would be elected in June to make recommendations to the British government as to possible forms of future government. The British government would then ascertain the opinion of the people as a whole by means of a referendum. A group of Newfoundlanders led by Peter Cashin contested the right of the British government to authorize a national convention and demanded the immediate return of self-government. There seemed also to be a growing body of opinion in favour of confederation with Canada. Polling took place in Newfoundland on June 21, with a total poll of 70%. Because of communication difficulties, polling in Labrador took place from Aug. 8-Sept. 4.

The peak period of Newfoundland's prosperity was passed in 1943, but as the result of large contracts placed by the United Nations Relief and Rehabilitation administration and allocations by the Combined Food board the fishing industry revived and general prosperity was maintained. The airbase at Gander installed by the Canadian government at a cost of \$25,000,000 was handed back to Newfoundland for \$1,000,000 under the terms of an agreement signed by Canada, Great Britain and Newfoundland on May 8, 1946. Gander was to be the island's international airport and while not expected to be a source of revenue for some years could ultimately be a valuable asset.

New Guinea

One of the largest islands in the world, New Guinea is separated from the smallest continent, Australia, by the shallow Torres strait. The island lies between the equator and 12° southern latitude. Its total area is 312,129 sq.mi. The 141 E. meridian separates the western territory under Netherlands rule (151,789 sq.mi.) from two eastern dependencies under Australian rule: British New Guinea, better known as Papua, in the southeast (90,540 sq.mi.), and the former German colony, now the Mandated Territory of New Guinea in the northeast (69,800 sq.mi.)—the boundary between the two running roughly along the watershed of the central mountain spine. (See NETHERLANDS INDIES.)

The island's tropical climate and rugged topography, its dense rain forests, torrential streams and mosquito-infested plains and morasses rendered difficult not only profitable modern land uses but even exploration. The same conditions also explained the sparseness of the indigenous population, composed of Melanesian, Australoid and Negrito elements. Its numbers were estimated as about 500,000 for Netherlands New Guinea and twice as many under Australian rule. The density of the indigenous population was estimated as 3.7 per sq.mi. for Papua, 6.2 for the Mandated Territory and 1.9 for Netherlands New Guinea.

European settlements remained small, and, for the most part, close to the shore. Settlements of Javanese, Chinese and other Orientals likewise were scattered and nowhere had assumed noteworthy proportions. Although the highlands of New Guinea were sometimes mentioned as available for white colonization, aerial surveys showed that the

areas suitable for agricultural uses were discontinuous and difficult of access; only where unusual natural resources, such as oil or gold, were found would it pay to construct the necessary means of communication. The more accessible plains, after clearance of the virgin forest or jungle, often are so leached by heavy rainfall that the top soil, never fertile or deep, is soon exhausted. In all of these respects, however, Papua and the Mandated Territory are in a slightly better condition than Netherlands New Guinea.

Exotic Birds and Gold.—Not situated on or near one of the great routes of communication connecting the continents of the world, New Guinea's sparse and underdeveloped population did not produce in significant size raw materials which elsewhere in southeast Asia attracted the attention of the western world. That is why at the end of the 19th century little was known of the island in general and hardly anything of the interior.

The Netherlands eastern part of the land made some reputation as the home of the paradise and other magnificently coloured birds. In the first two decades of the 20th century this had led to a profitable trade in bird feathers for fashions in Europe and in the western hemisphere. However, this profitable trade came to an end when styles changed, and when the Netherlands Indies government stepped in, first to restrict and later to prohibit the shooting of these birds.

Meanwhile, the trade in exotic birds and the discovery of gold in the Australian part of New Guinea focused attention on the island. These conditions, as well as scientific interests, brought about a number of private and governmental scientific expeditions to explore the island more fully. The Australian eastern part, less extended than the Netherlands western part, was fully charted by the end of 1946. In the Netherlands section, almost all of the island had been explored. The highest peaks in the

central mountain range in Netherlands New Guinea had been scaled.

Transportation in these wild rugged mountains and vast morasses was the bottleneck for explorative purposes. Even before World War II, however, the aeroplane came into use for this purpose. A Dutch expedition to a snow peak was provided with parachuted supplies. A U.S.-Dutch expedition situated its base camp on the border of an inland lake from where communication with the coast was served by hydroplane.

When war in the Pacific broke out in Dec. 1941, a Netherlands expedition was on its way to fill in the remaining blank spots on the map of Netherlands New Guinea. The expedition had to be discontinued, but a few members of the expedition stayed on and, although harried by the Japanese, maintained communication with Netherlands Indies government agencies which, after the surrender of the Indies to the Japanese, were established in Australia. These members of the expedition practically fulfilled the expedition's mission. After a year they were picked up by aeroplane.

Administration and Development.—In the footsteps of the scientific explorers, administrators came and established regular government, starting with stations on the coast and penetrating gradually into the interior. With them came physicians and teachers, preceded and followed by missionaries, Protestant and Roman Catholic.

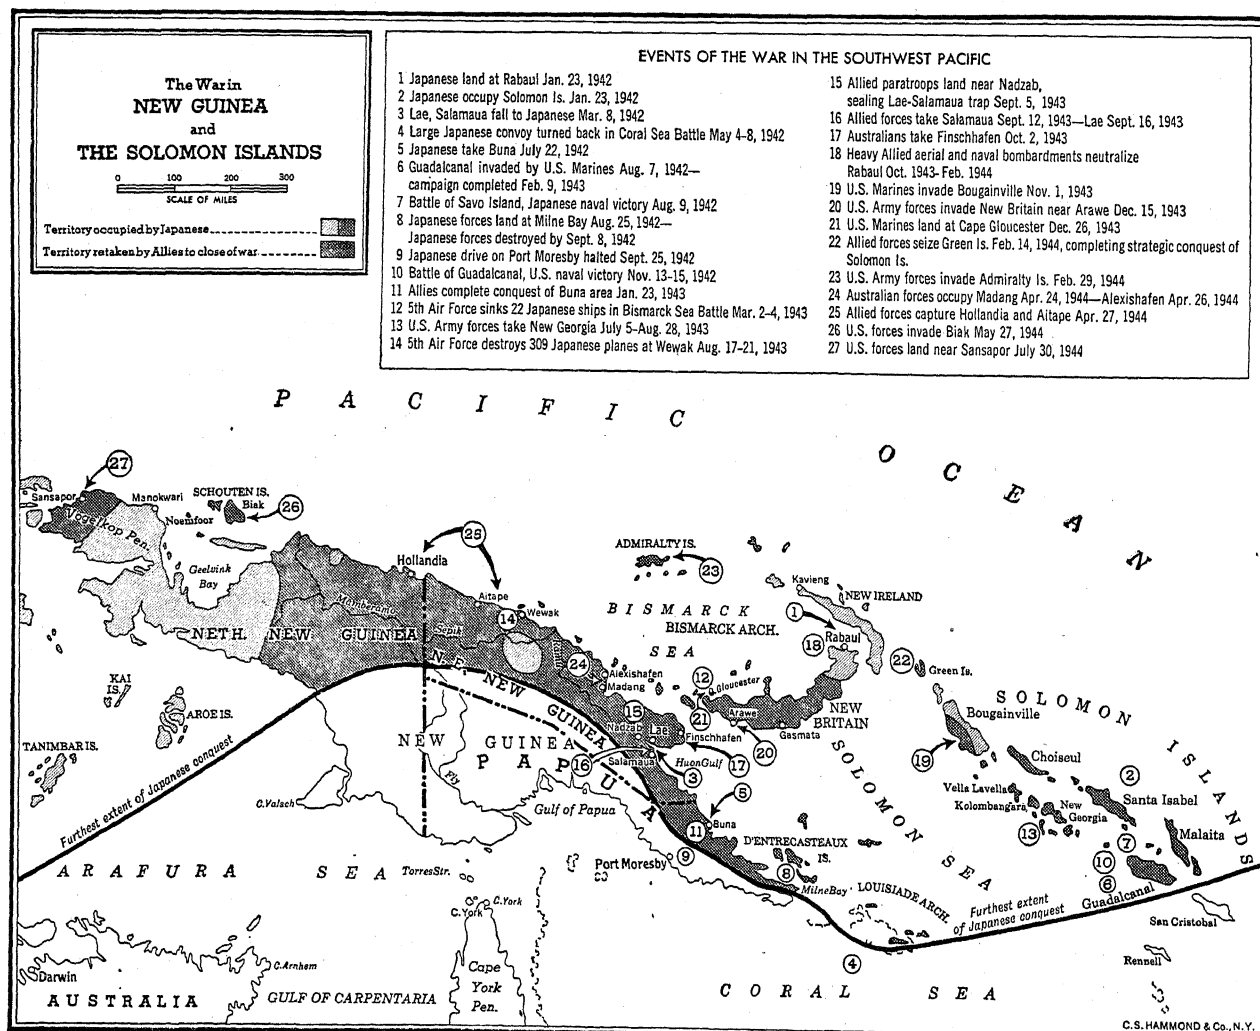

When World War II broke out, the whole island of

New Guinea was under regular administration with the exception of the most remote and inaccessible areas in the Netherlands section of the island. The term "regular administration" should not, however, in relation to New Guinea, be taken in its western sense. The possibilities of administration in a land of primitive nomads, scattered in relatively small bands over a wide area of inhospitable land, were far less than in a modern country.

The results of the explorative expeditions were of scientific rather than practical value. They proved that the resources of the island in relation to its soil and its population were poor, more so in the Netherlands territory than in the Australian sector.

The resources in the subsoil, however, had not been fully discovered. Gold exploration in the Australian part of the island was important. Here Australians did a remarkable job, setting up a gold industry with aurally transported machinery. Oil was discovered in the Netherlands part. A joint oil company, in which one Dutch and two U.S. oil companies participated, each for a third, received a contract from the Netherlands East Indies government to explore and exploit oil. The most modern methods, aerial photography among them, were used on an extensive scale to explore the presence of oil layers. Test drillings were made; results were not conclusive.

Since native production had been very low and insignificant both in the Netherlands and in the Australian part of the island, endeavours were made to establish non-native agricultural enterprises. These enterprises met with success in the Australian section, where they profited from

Smoke screen shielding U.S. paratroopers jumping at low altitude from transport planes during an attack on the Japanese-held Markham valley of New Guinea, Sept. 5, 1943

a near-by-home market, and from a system of indentured labour. The latter, however, attracted mounting criticism. In the Netherlands territory no indentured labour was introduced. Development was along lines of native owner-cultivation of the land under scientific government supervision, and of estates-agriculture employing free native and imported labour, mostly Javanese. A rubber estate was set up by the government of the Netherlands Indies as an experimental station.

In the '30s the Netherlands government thought it unwise to frustrate all Japanese requests to concessions in the Netherlands part of New Guinea. Consequently Japanese interests were allowed a timber concession near Geelvink bay, and 500 acres at Momi near Manokwari to experiment with cotton. Both economic attempts came to naught.

War and Limelight.—When war broke out in the Pacific in 1941, the huge island of New Guinea, in the shape of a prehistoric animal shielding Australia against a southward drive of a northern foe, came out of its relative obscurity into the limelight of public attention. For months on end, main events of the war were staged there.

If the Japanese forces had not been delayed by the gallant defense in the Philippines, in the Netherlands Indies and in Malaya, where Americans, Netherlands and Britons fought side by side with Filipinos, Indonesians and Malays, there seems to be little doubt that the whole of New Guinea would have fallen prey to the Japanese and that Australia would have suffered invasion. As it was,

New Guinea and the seas and islands around its tail became the contested perimeter between Japanese forces on the one hand and U.S.-Australian forces assisted by Netherlands units on the other. The Japanese practically took the northern part of the island, but could not conquer Papua and Port Moresby, nor the southwestern part of Netherlands New Guinea with Merauke as its centre. The latter area had been the only part of the Netherlands Indies where the Japanese could not enter.

After the battles of the Coral sea and Guadalcanal, where Japanese endeavours to lay a basis for invasion of Australia were frustrated, the limits beyond which Japanese might in this part of the world could not go were fixed. In the autumn of 1942, a daring drive of Japanese army units from the north coast of New Guinea over the Owen Stanley mountain range southward with intentions of capturing Port Moresby, civilian and military headquarters of Papua, was frustrated first and counteracted subsequently by General Douglas MacArthur's northward thrust over the same mountain range. This drive of MacArthur's was the first in history which had to rely entirely on air transportation, since there were no land communications. Here also were the experimental beginnings of the strategy and tactics which later developed into the leapfrog occupation of military bases, first along the north coast of New Guinea, driving the Japanese from such bases as Lae, Salamaua and Finschhafen, and later on northward in the direction of the Philippines. Sustained by superiority on the sea and in the air, this strategy broke Japanese resistance on the bases desired and left Japanese forces between the occupied bases to wither on the vine. The

Australian soldiers boarding a U.S. "LST" for transport to Lae, New Guinea, where they landed Sept. 4, 1943

Japanese army had to take to land cultivation in order to avoid mass starvation, which nonetheless was the lot of tens of thousands of Japanese soldiers in New Guinea. The native population, maltreated by the Japanese, turned against them. In almost all the Japanese bases retaken by the Allies, the sorry lot of labour forces from Java came to light. At Manokwari an original force of 1,700 Japanese was reduced to 217 emaciated survivors.

When Hollandia, township on the north coast of Netherlands New Guinea, was occupied in April 1944 by the leapfrog strategy, a military base of the first order was established for the forces destined to invade the Philippines. Never in history had more modern and extended bases been built in a land as primitive as New Guinea. Formal Japanese surrender took place on a British aircraft carrier off Rabaul on Sept. 6, 1945. The Japanese naval forces in New Guinea surrendered five days later. (See also WORLD WAR II.)

Postwar.—When the Allied forces landed at Hollandia in April 1944, they were accompanied by a group of 100 Netherlands Indies civilian officials who, first under the military command and later under their own government, inaugurated a new policy—the complete merger of the Netherlands and the Indonesian civil services which previously had been separate. Later, such groups, under the Netherlands Indies Civil Affairs administration, replaced in every reoccupied district the badly shattered administrative personnel.

Without waiting for the adoption of the promised new constitution (see NETHERLANDS INDIES), complete equality was already established in the training and assignment of these officials; Netherlands frequently serving under Indonesian superiors and all being subjected to the same

regulations. Native local officials such as the heads of villages, who had remained remarkably loyal to the government under trying conditions, helped to re-establish normal government. At first, the resettling of refugees as they returned from the wild mountain country, and the distribution of food and other necessary supplies, made heavy demands on the combined staffs under military direction.

Australian New Guinea remained under army control until Oct. 1945, when Papua and that part of the Mandated Territory south of the Markham river at Lae were placed under a provisional combined civil government. The rest of the territory was placed under the authority of that government in June 1946. Immediately, Australia's minister of external affairs introduced a program of reforms designed to recognize the principle of trusteeship, not only for the Mandated Territory, but for Papua as well. They were merged by the Papua-New Guinea Provisional Administration act of July 19, 1945. Among other provisions, this act abolished indentured labour and professional labour recruiting; a limit was set on the number and age groups of natives who might be drawn from any village for outside employment. The act also provided for "ultimate participation in self-government by the natives" and for a vigorous promotion of native subsistence farming. Health and education were to be among the first claims on an enlarged budget.

Although the Netherlands authorities already had gone far in legislating for the security and advancement of the indigenous population, the disturbances in Java which accompanied and followed re-occupation of that island temporarily delayed the introduction of any far-reaching changes in the administration of the outer provinces. In the discussions concerning constitutional changes between the Netherlands officials and Indonesian nationalist leaders, an outstanding problem was that of administration for populations which, as in New Guinea, were still largely following a traditional way of life and had only recently emerged from a pre-agricultural stage of tribal development.

New Hampshire

One of the New England group and one of the original states of the union, New Hampshire is popularly known as the "Granite state." Area 9,304 sq.mi., including 280 sq.mi. of water. Population (1940) 491,524, of which 57.6% was urban and 42.4% rural. Of the total population, whites numbered 490,989, including 422,693 native and 68,296 foreign born. Capital, Concord (27,171). Other cities: Manchester (77,685), Nashua (32,927), Berlin (19,084), Dover (14,990) and Portsmouth (14,821). Estimated population, July 1, 1944, 457,231, representing a decrease of 7%.

During 1937, Alphonse Roy (Dem.) unsuccessfully contested the seat of U.S. Representative Arthur B. Jenks, following their election tie of 1936. Important measures passed by the legislature in its 1937 session were: a 48-hr. act for women and minors in labour; acts establishing a state milk control board; a state police, and a state department of public welfare to administer poor relief and old-age assistance and to supervise state welfare institutions.

In the state election of Nov. 8, 1938, Francis P. Murphy (Rep.) received 107,841 votes and John L. Sullivan (Dem.) 80,847 for governor. For U.S. senator, Charles W. Tobey (Rep.) received 100,633 and Fred H. Brown (Dem.) 84,920. On June 9, 1938, the U.S. house of representatives had voted to unseat Arthur B. Jenks (Rep.), returning to congress from the 1st district and to give his place to Alphonse Roy (Dem.). Jenks had defeated Roy by a vote of 52,174 to 44,681. A convention for revision of the state constitution met from May 11 to June 1, 1938. Four proposed amendments were submitted to the electorate and voted upon Nov. 8: (1) to authorize graduated income and inheritance taxes and a sales tax; (2) to permit absentee voting in state elections; (3) to give the legislature power to define paupers as related to prohibitions against voting; (4) to prevent the diversion of gasoline taxes to other than highway use. Only the last mentioned amendment was adopted, a two-thirds majority being required. On Sept. 21, the state was swept by a hurricane which did great damage to standing timber, buildings and power systems.

The 162nd session of the general court extended from Jan. 4 to June 17, 1939. Important measures enacted were those authorizing a \$5,000,000 bond issue for construction, reconstruction and maintenance of highways and for reimbursement of towns for hurricane and flood damage; levying a 15% tax on all tobacco products as a means of eliminating the direct tax of \$1,200,000 a year; approving acquisition by the federal government of land, at four sites in the state, for construction of flood control

dams; and extending legality of pari-mutuel horse race betting through 1942.

Robert O. Blood (Rep.) was elected governor in the Nov. 1940 election. Other officers were: secretary of state, Enoch D. Fuller; treasurer, F. Gordon Kimball; commissary general, Charles F. Bowen; attorney general, Frank R. Kenison (all Republican). In the general court in 1941 were 12 Republican senators, 9 Democratic and 3 elected by both parties. The house of representatives included 229 Republicans and 194 Democrats. While the state government was controlled by the Republicans as a result of the 1940 election, Roosevelt carried the state by a popular vote of 125,292 as compared with 110,127 for Wendell L. Willkie. During 1940 the state supreme court held as constitutional the sales tax on tobacco levied by the legislature at its last session. The revenue from this tax made it unnecessary to collect any state property tax. The state completed a large flood control and conservation project on the Connecticut river, while the war department began the construction of flood control projects at Surry mountain on the Ashuelot river, at Webster on the Blackwater river and at Franklin Falls on the Pemigewasset.

The general court met in its 163rd session from Jan. 1 to June 13, 1941. Important legislation included an act setting up a state council of defense; an antisabotage act; a law for regulating the sale and handling of explosives; an act establishing a state guard regiment for local military defense; a capital budget act carrying an appropriation of \$216,000 for new construction and improvements to state buildings; and an act abolishing the 2% capital stock tax on domestic insurance firms. The state constitutional convention was reconvened Sept. 23 to consider reduction of membership in the house of representatives, which stood at a high of 423. A proposal was adopted designed to effect a reduction of approximately 60 seats, which was to be submitted to the voters at the state election of 1942.

In the election of Nov. 1942, Robert O. Blood (Rep.) was re-elected governor by a vote of 83,766 over 76,782 for William J. Neal (Dem.). H. Styles Bridges (Rep.) was re-elected U.S. senator by a vote of 88,601 over 73,656 for Francis P. Murphy (Dem.). The voters approved the amending of the state constitution to permit the reduction of the house of representatives from 423 to a number between 375 and 400. During 1942 the activities of the state council of defense were greatly extended, and an increase of the state guard to four battalions was authorized.

The general court was in session from Jan. 6 to May 20, 1943. Measures passed included an act granting broad emergency war powers to the governor and council; an act creating a state veterans' council, to aid returning soldiers and ensure them preference in public employment; and an act providing for a soldiers' bonus, to be paid any resident of the state serving more than 90 days in the armed forces, such bonus to amount to \$10 a month for each month of service, the total not to exceed \$100. To finance bonus payments, the poll tax was increased by \$3.

In 1944 a special session of the general court was convened, and acts were passed exempting veterans of World War II from payment of the poll tax and the property tax on real estate up to \$1,000 valuation; permitting absentees to register for voting purposes by affidavit; and providing for absentee voting by members of the armed forces and civilians serving with the armed forces. At the general election of Nov. 7, Franklin D. Roosevelt received 119,663 votes and Thomas E. Dewey 109,916. In the election for

governor there were 115,799 votes for Charles M. Dale (Rep.) and 102,232 for James J. Powers (Dem.).

The general court was in session from Jan. 3 to May 18, 1945. Among measures passed were acts to guarantee re-employment of veterans by towns and other political subdivisions of the state; to provide an aerial survey of the state; to abolish the special poll tax of \$3 enacted in 1943; to create a retirement system for state employees; to provide temporary additional compensation for state employees; and to promote the cause of soil conservation. A joint resolution authorized a referendum, by towns, on the question of United States membership in a general system of international co-operation, with police power to maintain world peace.

The general court was not in session during 1946; town meetings were held on March 12 and the state primary election on Aug. 6. At the general election in Nov. 1946, Gov. Dale was re-elected governor by a vote of 103,204 over F. Clyde Keefe (Democrat), who received 60,247. The Republicans also won decisive majorities in the state senate and house of representatives. On a referendum for calling a convention to revise the state constitution, 49,230 votes were cast in favour of the proposal and 29,336 against. The state poll tax was reduced from \$5 to \$2, as a result of action taken by the general court in 1945, repealing the levy of \$3 to provide revenue for a soldiers' bonus.

State officers in 1946, in addition to Gov. Dale, were: secretary of state, Enoch D. Fuller; state treasurer, F. Gordon Kimball; commissary general and adjutant general, Charles F. Bowen; attorney general, Ernest R. D'Amours; commissioner of education, James N. Pringle, succeeded on Feb. 16 by Edgar Fuller.

New Jersey

One of the middle Atlantic states, known as the "Garden state," New Jersey entered the union on Dec. 18, 1787. Area, 7,836 sq.mi., including 314 sq.mi. of water; pop. (1940) 4,160,165. Capital, Trenton (124,697). Other cities: Newark (429,760); Jersey City (301,173); Paterson (139,656); Camden (117,536) and Elizabeth (109,912). On July 1, 1944, the bureau of the census estimated the civilian population at 4,167,840.

In 1937, A. Harry Moore (Dem.) was elected governor for the third time, the first 3rd-term governor in the history of the state. He defeated Senator Lester H. Clee (Rep.) by 45,000 votes. The Republicans, however, won control of both houses of the legislature. The state appropriated \$12,000,000 as aid for municipalities in meeting the relief problem, but the sum was insufficient. The legislature was reconvened, in Nov. 1937, to appropriate additional funds but failed to do so. The burden of meeting the deficit was shifted to the governor, who raised the necessary \$3,000,000 from general sources.

The year 1938 was notable for the comeback of the Republican party in New Jersey. W. Warren Barbour ran as the Republican candidate for the unfinished term of Governor Moore. He defeated his Democratic opponent, William H. J. Ely, by 107,000 votes, carrying 19 of the state's 21 counties. In addition the Republican majority on joint ballot in the 1939 legislature was increased from 27 votes in the 1938 session to 55 for 1939. About \$10,000,000 was provided to assist municipalities, and the total relief bill was in excess of \$20,000,000. The state pay roll reached an all-time high of \$22,000,000 because of increased personnel and restoration of salary deductions. The legislature enacted legislation fixing prices in general trade and in the liquor business. New Jersey railroads lost their appeal in the third United States circuit court to upset the system of assessing their property. The year also witnessed the Hague-C.I.O. struggle in Jersey City, and an injunction was issued in the United States district court enjoining Mayor Hague from interfering with civil liberties.

During 1939 the Republican party added to the gains begun in 1938. Only legislative and local offices were at stake, but the Republicans took control of the 1940 legislature by the largest majority since 1930. A constitutional

322 provision against gambling was modified at a state-wide referendum to permit pari-mutuel betting at race tracks. The legislature authorized a referendum on a bond issue of \$21,000,000, representing the state's share of relief for 1940-41. The referendum was carried by 47,000 votes. The United States district court declared the state's formula of taxing railroads to be invalid and in effect cancelled approximately \$15,000,000 which the state claimed to be due for 1934-36. The controversy between Mayor Frank Hague and the C.I.O. was terminated by the United States supreme court. An ordinance, under which the police power was used to prohibit public meetings in streets and parks, was ruled unconstitutional.

In the 1940 election President Roosevelt received 1,016,404 votes and Wendell Willkie 944,876. Charles Edison, former secretary of the navy, was elected governor over Robert C. Hendrickson, his Republican opponent, by 63,875 votes. But W. Warren Barbour, candidate for a six-year term in the U.S. senate, defeated Democrat James H. R. Cromwell and the Republicans rolled up a majority of 79,979 on the basis of the average assembly vote. Accordingly the Republicans retained control of the assembly by a majority of 41 to 19 and of the senate by a majority of 16 to 5. The election was preceded by a Republican drive against the Hudson county organization of Mayor Hague. The legislature tried unsuccessfully to compel the installation of voting machines in Hudson and the committee on campaign expenditures of the U.S. senate assigned investigators to the county. The Republican legislature also reorganized the election bureaus in Hudson and Essex counties and installed new superintendents in each. Nevertheless the Hague organization carried the two counties for Roosevelt and Edison by majorities of 100,000. In the inquiry into election practices, it was disclosed that Jersey City's poll books had been burned early in 1940. Republicans contended the destruction of the records corroborated their allegations, while Jersey City authorities maintained the burning of the poll books was legal, inasmuch as the law required only that they be preserved for two years. (A. J. S.; X.)

A significant political development in 1941 was the break between Governor Edison and Mayor Hague of Jersey City after the governor appeared before the Republican legislature in joint session and urged the adoption of the railroad tax bills. This legislation provided for a new method of taxing railroad property. It had been bitterly opposed by Mayor Hague who contended the legislation favoured the railroads unduly. Governor Edison acted upon the recommendations of a fact-finding committee which he appointed to resolve the long-standing controversy. He contended that the proposed system was equitable and that in prosperous years the state would reap larger returns than ever. The new laws did not end the litigation. Attorney General David T. Wilentz, supporting Mayor Hague, attacked the constitutionality of the laws in the court of chancery. The state treasurer, William Albright, was authorized by the legislature to engage counsel to defend its action.

During 1941 Governor Edison conducted a campaign to elect a Democratic assembly and to gain senate seats. He appeared in almost every county. The Hague organization remained aloof from the state fight, concentrating on the production of a huge "protest vote" in Hudson county against the railroad laws. The Hague candidates were elected overwhelmingly, and the Republicans retained control of the legislature by increased majorities in both

houses. The house was Republican by 43 to 17; the senate, Republican by 17 to 4. Apart from the accord on the railroad issue, the year was one of conflict between the governor and the legislature. The dispute had its origin in the refusal of the senate to confirm some of the governor's key appointees. On Dec. 22, 1941, the legislature revived an old law giving the governor wide powers to call upon the resources and personnel of the state in a war emergency. Under it the governor formed a war cabinet to expedite civilian defense measures and to extend the work of the state defense council. As another defense measure, a state guard, consisting of approximately 2,000, was equipped to replace the national guard.

A resurgence of the Republican party in 1942 culminated in the election of Albert W. Hawkes to the U.S. senate. He defeated the incumbent Democrat, William H. Smathers, by more than 84,000 votes in a bitterly-fought contest. Smathers had the support of Mayor Hague and the endorsement of many leaders of organized labour, both C.I.O. and A.F. of L. He did not, however, have the support of Democratic Governor Edison, and this division in the party largely accounted for the Democratic defeat in the election. The Republicans picked up another seat in the house of representatives, thereby making the state's congressional delegation 11 Republicans and 3 Democrats, and won overwhelming control of the state legislature.

Throughout 1942 Governor Edison had striven unsuccessfully to advance the cause of constitutional revision. His crusade was generally supported by the state press, many civic organizations and speakers' bureaus. Mayor Hague's organizations opposed the plan, but the chief opposition originated in the state senate. Differences between the governor and Mayor Hague on the constitution marked only one aspect of their intraparty conflict. The governor early in 1942 ousted the Hudson county tax board, an important cog in the Hague machine, and appointed a new board which began immediately to reduce Hudson county assessments on the score that they were inflated and did not represent equitable valuations. Mayor Hague responded with renewed attacks on the governor as being instrumental in compromising railroad taxes long overdue, with accumulated penalties amounting to more than \$20,000,000.

The elections of 1943 completed the Republican conquest of major elective offices in New Jersey. Walter E. Edge was elected governor by a majority of 127,000 over Mayor Vincent J. Murphy, the Democratic nominee. The Republicans retained large majorities in both branches of the legislature, with 44 Republicans to 16 Democrats in the assembly, and 18 to 3 in the senate. The Democrats gained possession of a U.S. senate seat when Senator W. Warren Barbour's death left a vacancy to which Governor Edison appointed Arthur Walsh. The elections also marked the first step toward the adoption of a new constitution. A referendum was adopted by a majority of 154,000, directing the 1944 legislature to write a new constitution for ratification or rejection at the 1944 general election. The controversial railroad tax legislation was ruled unconstitutional in the court of chancery and an appeal from the chancery decision was taken immediately to the court of errors and appeals.

For the fourth consecutive time, President Roosevelt won the state's 16 electoral votes in the quadrennial elec-

Testing unit for high octane fuels maintained by the Standard Oil Company of New Jersey at Paterson, N.J. Petroleum refineries as well as other industrial equipment in the state underwent considerable expansion during World War II to meet production schedules

tions of 1944. The vote was: Roosevelt 987,874; Dewey 961,335. President Roosevelt's majority was insufficient to carry the rest of the Democratic ticket to victory. H. Alexander Smith (Rep.) was elected to the U.S. senate over Representative Elmer H. Wene (Dem.) to succeed to the seat held by Arthur Walsh (Dem.). The Republicans gained another seat in the house by electing a successor to Elmer H. Wene in the 1st district. The Democrats won in only two of the state's 14 districts. The legislature remained overwhelmingly Republican.

Of almost comparable importance to the presidential

election in 1944 was the referendum on a new constitution which the Constitutional Revision commission, a bi-partisan agency, had developed. The new charter provided for a new court structure, 90-day sessions of the legislature, increased salaries for senators and assemblymen, assessment of all property at uniform rates, required a three-fifths vote instead of a bare majority to re-enact vetoed bills, and would have given legislative committees wide investigatory powers to inquire into the official conduct of public officials. It was defeated by 127,000 votes. Mayor Hague and the regular Democratic organization, the state federation of labour and the C.I.O. opposed the new constitution. It was endorsed by the Republican state platform and had

Democratic support from former Governor Edison.

The chief political interest in 1945 centred in the legislative elections and the special election in the 4th congressional district. The Republicans continued their control of the legislature, winning 42 seats in the assembly as against 18 for the Democrats and 17 seats in the senate as against 4 for the Democrats. The 4th district election also resulted in a Republican victory that kept the state's congressional delegation Republican by 12 to 2. Primarily because of an intraparty fight among the Democrats, the Republicans elected Frank A. Mathews, Jr. to succeed D. Lane Powers. The campaign was enlivened by Democratic attacks on the state racing commission over the issuance of a licence for a race track in Middlesex county near Rutgers university. The application for the licence was withdrawn and as a result of the controversy the racing commission adopted a resolution petitioning the legislature to levy on the breakage—the odd pennies remaining in the pari-mutuel pools after each bet was settled—which for the 50-day season at Camden amounted to more than \$600,000. The commission also granted licences for two more race tracks, one at Long Branch and the other near Atlantic city.

The 1945 session of the legislature saw the enactment of the Fair Employment Practices act, a measure designed to outlaw racial and religious dis-
